EDITOR'S NOTE

The overall aim of the *Encyclopedia of Interior Design* is to provide description and analysis of a range of subjects and individuals related to the history of interiors. The entries are arranged in alphabetical order and fall into two broad categories: those on individuals, encompassing architects, critics, designers, makers and patrons; and those dealing with topics such as room types, decoration and particular items of furniture. There are also several longer survey articles relating to individual countries, periods and styles. Given the enormity of the project it was felt that to include a discussion of ecclesiastical interiors would necessitate the publication of one additional volume, if not several. For this reason a decision was taken at the outset to confine the scope of the *Encyclopedia* to the study of secular interiors.

The study of interior design is a task fraught with difficulties, not least because of the amorphous nature of the subject and its comparatively recent emergence as a professional discipline. Much of this complexity is due to the fact that interiors encompass a huge variety of constituents ranging from fixed elements such as room-plans and architectural fittings, to more interchangeable items such as furnishings, to the most ephemeral features such as paint colours, wallcoverings and textiles. The individuals involved in shaping the appearance of an interior have been similarly varied, and prior to the late 19th and early 20th centuries, when an interest in decoration and furnishing was first formalized under the heading interior design, these might have included the patron or client, an architect or designer, as well as myriad craftsmen, suppliers and manufacturers. And finally numerous other factors, including social class, income, gender, convention, new technology and fashion, have exercised important influences on the design and decoration of public and domestic spaces.

But notwithstanding the dangers attendant on embarking on a project of this kind, the need for an *Encyclopedia of Interior Design* was clearly evident. The existing literature consists of dictionaries of individuals, for example architects and designers; dictionaries of objects, defined principally under the heading of the Decorative Arts; and technical manuals. These two volumes represent the first attempt to bring together all the disparate elements and to focus the discussion on interior design within specific entries on individuals and objects. It is hoped that a particular strength of the project is the inclusion of articles on the history and function of common room types such as bedrooms and drawing rooms and generic items of furniture such as tables and chairs that are rarely discussed elsewhere.

The final selection of entries for the *Encyclopedia* was the result of a long process of refining an original much longer list of suggestions on the basis of views and ideas put forward by the project's advisers (listed in the Acknowledgments and on page ix), as well as those of the contributing essayists, and other scholars and commentators. The principal criteria employed in the selection of articles on individuals were, first, that they had been consistently involved in the design of interiors during their careers, and/or second, that their work had had an especially strong or lasting impact on an aspect of interior design. Even so, it has obviously not been possible to include every architect or designer of note, and the *Encyclopedia* does not claim to do so. But where well-known individuals do not appear in separate entries, for example Michelangelo, who worked primarily on ecclesiastical commissions and so does not qualify for inclusion here, they are generally discussed within one of the survey essays (see Renaissance and Italy). A full

alphabetical list of subjects and individuals mentioned within the *Encyclopedia* appears in the index at the end of the second volume.

A perhaps inevitable bias of the *Encyclopedia* is towards upper-middle-class and aristocratic interiors. This is partly because these tend to represent the most well-documented and best-preserved examples, and are often where changes in style, new fashions or technology are most clearly reflected. But it is hoped that to some extent this emphasis is offset by the broader focus within many of the topic entries, such as the articles on Coffee Tables and Three-Piece Suites, which discuss objects used in more middle-income rooms. Another bias is the space devoted to individuals and examples dating from the 19th and 20th centuries. Again, this is largely due to the comparative wealth of documentation and scholarship existing on these periods; considerably more research needs to be carried out on the earlier centuries before this imbalance can be adequately redressed. And finally, the content of the *Encyclopedia* is undeniably Eurocentric and North American in its focus. Practical limitations did not allow for much detail on the other parts of the world, but such survey entries as those on Middle Eastern interiors, Japan, China, and Australia are intended as starting points for further study.

The entries themselves consist of a signed critical essay, a summary biography and list of principal works where appropriate, and a list of further reading. The essays provide a broad historical overview of the subject; more detailed study can be pursued through the works cited in the accompanying bibliographies. Once again, the bibliographies (arranged alphabetically by author) are not exhaustive but have been selected to represent a range of available material and include at least one or two in-depth studies containing their own detailed reading lists. The amount and quality of information given in the list of principal works can vary from entry to entry, depending on the quantity and calibre of research available in recent secondary sources. But each item should indicate the date and location of the work and the nature of the individual's involvement; patrons or clients are also often cited here, as well as being mentioned in the essays.

This project has been completed over a two-and-a-half-year period, which still seems like a staggeringly short period of time. At its inception it was intended that all the information should be compressed into a single volume. But like so many interiors of the past, as the ambitions of all those involved have grown, its contents have multiplied and it has expanded to fill two large books. Even so, there is still much more that could and should be written on interior design, and it is hoped that this *Encyclopedia* will be a useful resource for future work.

Acknowledgments

A huge number of people have provided help, advice and support throughout the production of this book. Chief among them are the panel of Advisers — Megan Aldrich, Yvonne Brunhammer, Stephen Calloway, John R. Clarke, Frances Collard, David Crowley, Penelope Eames, Charlotte Gere, Wendy Kaplan, Anne Massey, Sarah Medlam, Sarah Nichols, Steven Parissien, Charles Saumarez Smith, Mary Schoeser, and Gerald W.R. Ward — who grappled with the daunting task of helping to shape the final list of entries and who drew my attention to several important omissions. No less deserving are all the scholars and specialists who have written for the book, several at short notice, and many of whom were unstintingly generous with their time and expertise in answering queries. Special thanks are due to Luciana Arbace, Jody Clowes, Elaine Denby, Clive Edwards, Curtis Evarts, Helen Grainger, Lesley Jackson, Derek Linstrum, John Pile, Katie Scott, Helen Searing, Clive Wainwright, John Wilton-Ely, and Jonathan Woodham. Antonia Boström provided invaluable help with additional research for selected biographies and bibliographies and Jacqueline Griffin proved an enormously skilled and conscientious sub-editor. Many thanks too must go to Leanda Shrimpton and Maja Mihajlovic, who worked on the pictures and who came up with numerous imaginative and useful suggestions. I should also like to thank the staff of the National Art Library and the British Library. But I owe a special debt of gratitude to all my colleagues at Fitzroy Dearborn: Philippe Barbour, Kate Berney, Delia Gaze, Mark Hawkins-Dady, and Lesley Henderson. And above all to Daniel Kirkpatrick, whose unshakable faith in the project and whose scrupulous attention to detail at every stage in its production have contributed more than anything else to ensuring its completion.

A

Aalto, Alvar 1898–1976

Finnish architect and designer

Alvar Aalto's lyrical, sensuous design drawings poignantly record his process of generating form. These painterly lines, made with soft pencil on tracing paper, expressively describe the emergent, sinuously shaped spaces and forms of his buildings and interior spaces. While capturing the essence of Aalto's architectural production, his sketches also represent the design of an interior space, a piece of furniture, a light fixture, or a glass vase. Aalto's furnishings, paintings, and applied designs exhibit an uncanny resemblance to the formal and spatial configurations of his buildings and spaces. The design and crafting of a chair, a light fixture, or a glass bowl, was as much an architectural proposition as the making of a building or interior space. Engaging in furniture and applied design provided Aalto with the opportunity to examine design issues at a variety of scales and in different media, and this directly influenced his conception of architectural space and form.

As with most internationally respected architects, categorizing their oeuvre into discrete parts is often an artificial proposition. This is true for Aalto, for his intention was to design complete environments in which the unique building is complemented by equally unique interiors, and with furniture and other accessories designed for each particular environment. This intention plays an important role even in his earliest work.

Opening his first office in Jyväskylä in 1923, Aalto worked in a style termed Nordic Classicism, in which a catholic relationship existed between his architecture, interiors, and applied designs. Aalto's furniture and interior decoration in this period were designed to be stylistically compatible with specific spaces and settings. Interiors were often decorated with painted scenic wallpaper of classically inspired motifs, abstracted images of masonry rustication, austere picture mouldings and door and window frames, and stenciled friezes. Interior designs and furnishings for the Kouvola Garrison canteen (1923), the Seurahuone Café in Jyväskylä (1924), and the Hämäläis-Osakunta students' club in Helsinki (1924), are examples of work from this period. In each case, specialty furnishing and applied designs were developed. Exaggeration often played an important role in the furniture design: legs which were thinner or more boldly profiled than normal,

balusters which whimsically modified the conventions of the "split spindle" motif, oddly proportioned knobs and turned pieces, and the addition of idiosyncratic decoration are common in the work of this period.

In 1924 Aalto married the architect Aino Marsio (1894–1949), who was an equal partner in their work until her death. Aino's influence informed building design as well as the creation of furniture and applied art objects, and together husband and wife formed a symbiotic unit, complementing and contrasting one another. The situation was, to a similar extent, the same when Aalto married his second wife, the architect Elissa Makiniemi in 1952. She was also active in their practice until Aalto's death in 1976.

When he moved his office from Jyväskylä to Turku in 1927, Aalto enjoyed a modest national reputation; by the time he relocated to Helsinki in 1933, he had achieved international recognition. His international status resulted from four buildings – the Standard Block of Flats (1927–29) and the Turun Sanomat Newspaper Building (1928–29) in Turku, the Paimio Sanatorium (1929–32), and the Viipuri Library (1927–35) – and, significantly, from his furniture and applied designs. Aalto's conversion to Functionalism, as Modernism was termed in Finland, coincided with the move to Turku. His buildings, competition entries, and furniture designs appeared immediately to embrace Functionalism's focus on rational technique, serial production, and machine aesthetics. What Turku provided, along with an active architectural community, was connection to Stockholm and the continent. The significance of this rests in the contacts Aalto made as a result of his travels, for he associated with the European avant-garde and directly experienced the canonical works of the Modern Movement, thus keeping abreast of continental developments.

The Paimio Sanatorium, a potent symbol of the healthy new world Modernism promoted, demonstrates Aalto's mastery of Functionalist ideas. Conceptually, it is a clearly articulated set of discrete "functional" elements, expressed, in turn, in the machine aesthetic of concrete, steel, and glass. The interiors of the Sanatorium assumed the same machine-like quality, exemplifying the health-giving properties provided by sun, light, and fresh air. The manipulation of natural light became an important element in Aalto's interiors at this time, and continued as an important thematic issue permeating his architecture. The transformation seen in Aalto's architecture is also witnessed in his furniture designs.

Aalto: lecture room with undulating wooden ceiling, Municipal Library, Viipuri, 1933–35

Beginning in the late 1920s, Aalto became interested in creating serially manufactured wooden furniture for everyday use. This represented a desire to combine Finland's traditional wood-working industry with modern industrial production technology. During this period, through the development of numerous design prototypes and wood experiments in lamination and continuous moulding, Aalto explored the possibilities for mass-produced furniture. This culminated in the *Paimio* chair (1932) – consisting of laminated birch sides bent into a closed curve combined with a continuously moulded plywood seat back – specifically created for the Sanatorium along with five other pieces of furniture. While Aalto continued to develop furniture pieces throughout his career, his designs produced during this period provided the foundation for later works.

Hoping for increased commissions, Aalto moved to Helsinki in 1933. Though the next several years were a low point in his architectural productivity, it proved the opposite for furniture and applied designs. His mass-produced furniture, originally intended for use in a specific building, was made available to the general public by the firm of ARTEK, founded in 1933, which assumed the responsibility for the production and marketing of all of Aalto's subsequent furniture and fabric designs. The Aalto name became associated with glassware in 1932 through two entries in a competition

sponsored by Iittala and Karhula, and culminated in the sinuous, curved forms of the famous *Savoy* vases designed in 1937.

With the Viipuri Library, completed in 1935, Aalto's Functionalism began to wane, and was replaced by a more sinuous, tactile material vocabulary and expressive formal and spatial composition. Complementing the curved, undulating pine ceiling in the Viipuri lecture room, Aalto introduced a ceiling of conical skylights in the library reading room that was the precursor for the numerous interior spaces that followed. In his three most important commissions of the late 1930s – the Finnish Pavilion for the 1937 Paris World's Fair, the Villa Mairea (1938–39), and the Finnish Pavilion for the 1939 New York World's Fair – there is increased sinuosity in spatial organization, a more expressive play between natural and human-made materials, incorporation of natural light through skylights in major spaces, and a picturesqueness in building form. Sinuosity, tactility, light: these qualities dominated Aalto's work, at all levels, from the late 1930s on.

Between 1945 and the early 1960s, Aalto enjoyed an incredibly productive period – one lauded as being uniquely Finnish in feeling. Characterized by the use of red brick, copper and wood, exemplary interior spaces in the major building projects of the period include: the council chamber and entry staircase

in the Saynatsalo Town Hall (1950–52), the entry foyer and staircase in the Jyväskylä Teachers' College (1953–56), and the lecture halls in the Technical Institute in Otaniemi (1956–64); and in Helsinki, the interviewing area and restaurant of the National Pensions Institute (1953–57), and the atrium space of the Rautatalo Building (1953–57). The picturesque massing of these buildings, the rich mixture of materials and textural effects, the dynamic manipulation of natural light, and the quality of interior development, especially in the public areas, demonstrate Aalto's mature style. Many of these, as well as later works incorporate a multilevel skylighted atria that is accented by planting and staircases. These spaces often incorporate Aalto-designed wall tiles, fabrics, and lighting fixtures.

The last twenty years of Aalto's practice, beginning with the Vuoksenniska Church (1956–58), produced a more complex, expressive architecture, contrasting with the "bronze" imagery of the 1940s and 1950s. There is continuity with his earlier work – light, sinuosity, tactility, and integrated interiors still figure importantly in the designs – yet more explicit references to classical and romantic ordering qualities emerged at this time. The public interiors in the Seinäjoki Civic Complex (1958–65), the Wolfsburg Cultural Complex (1958–63), Finlandia Hall (1962–75), the Rovaniemi Library (1968), and the Riola Church (1966–78), along with Vuoksenniska, continue the interior qualities seen in Aalto's earlier work and represent the best of this late period. Of particular interest are the Kauffmann Rooms at the Institute of International Education in New York City (1963–65).

During his 50-year career, Aalto developed a rich and complex architectural language that explored the full range of expressive means available to the architect. The unique variety of architectural responses he created resulted from the belief that architecture is an affirmative act and the architect's role is to design and build. Aalto's was an architecture that was extremely humane, yet profoundly tangible.

Biography

Hugo Alvar Henrik Aalto. Born in Kuortane, near Jyväskylä, Finland, 3 February 1898. Married 1) the architect and designer Aino Marsio, 1924 (died 1949): two children; 2) Elissa Mäkinen, 1952. Studied architecture at Helsinki Polytechnic, 1916–21. Worked as an exhibition designer in Göteborg, Sweden, then Tampere and Turku, Finland, 1921–22; in private architectural practice, Jyväskylä, Finland, 1923–27; Turku, 1927–33; Helsinki, 1933–76. Worked in partnership with Aino Aalto, 1924–49; in partnership with Elissa Aalto 1952–76. Designed furniture from c.1920; lighting from mid-1920s; textiles and glass from 1930s; founded ARTEK to mass-produce furniture and textile designs, 1933. Professor, College of Architecture, Massachusetts Institute of Technology, Cambridge, 1946–47. Member, Academy of Finland, 1955; honorary member, Akademie der Künste, Berlin; honorary fellow, American Institute of Architects; Gold Medal, Royal Institute of British Architects, 1957. Died in Helsinki, 11 May 1976.

Selected Works

A vast collection of original drawings, designs, correspondence, cuttings and models is contained in the Alvar Aalto Archive, Alvar Aalto Foundation, which is housed in Aalto's house at Munkkiniemi, near Helsinki. Additional designs and collections of furniture,

textiles, glass, etc., are in the Alvar Aalto Museum, Jyväskylä, and the Finnish Museum of Architecture, and Finnish Museum of Applied Arts, Helsinki. For a guide to other collections see Weston 1995. A complete catalogue of Aalto's architectural and design work appears in Schildt 1994.

Interiors

- 1923 Garrison, Kouvola (canteen interiors and furnishings)
- 1924 Hämäläis-Osakunta Students' Club, Helsinki (interiors and furniture)
- 1924 Suerahuone Café, Jyväskylä (entrance and interiors, including furniture for the fireplace room, ladies' room, and dining room)
- 1929 700th Anniversary Fair, Turku (exhibition design and layout; with Erik Bryggman)
- 1929–32 Sanatorium, Paimio (building, interiors and furnishings)
- 1933–35 Municipal Library, Viipuri (building and furnishings)
- 1934–36 Alvar Aalto House, Munkkiniemi, near Helsinki (building, interiors and furnishings)
- 1937 Finnish Pavilion, Exposition Internationale des Arts et Techniques Appliqués à la Vie Moderne, Paris (building, interiors and displays)
- 1938–39 Villa Mairea, Noormarkku, near Pori (building, interiors and furnishings): Marie and Harry Gullichsen
- 1938–40 Finnish Pavilion, World's Fair, New York (building and interiors)
- 1950–52 Town Hall, Saynatsalo (council chamber and entry staircase)
- 1953–56 Teachers' College, Jyväskylä (entry foyer and staircase)
- 1953–57 National Pensions Institute, Helsinki (restaurant and interviewing area)
- 1956–64 Technical Institute, Otaniemi (lecture halls)
- 1957–59 Villa, Bazoches sur Guyonne, France (building, interiors and furnishings): Louis Carré
- 1962–75 Finlandia Hall Concert and Convention Center, Helsinki (buildings and interiors)
- 1963–65 Institute of International Education, New York (interiors and furnishings for the Kauffmann Rooms): Edgar Kauffmann, Jr.
- 1963–68 Library, Rovaniemi (building and interiors)

Aalto designed furniture, much of it plywood, from c.1930; his most celebrated works included the *Paimio* chair (1932), subsequently manufactured by ARTEK, and his bentwood series developed in collaboration with Otto Korhonen, from 1933. Aalto's designs for glassware date from 1932 and include the *Savoy* vases (1937).

Abildgaard, Nicolai Abraham 1743–1809

Danish artist, decorative painter and designer

Born the son of a draughtsman in Copenhagen in 1743, Nicolai Abraham Abildgaard was Denmark's foremost exponent of Neo-Classicism. He was primarily a painter but he also worked as an architect and as a designer of furniture, interiors and medals. From the mid-1790s he designed furniture and interiors for the Danish court and, as Director of the Academy (1789–91 and from 1801), he exercised a wide influence on the next generation of artists and designers, most notably his assistant, the sculptor Thorvaldsen.

Abildgaard was apprenticed as a decorative painter under J. E. Mandelberg and also studied at the Academy of Art in Copenhagen from 1764. A talented student, he won several medals between 1764 and 1767 and in 1771 he was awarded a scholarship that enabled him to study abroad. He left immediately for Italy where he remained – mainly in Rome – until 1777. Much of his time was spent studying the art and architecture of antiquity but he was also impressed by the work of Renaissance artists such as Annibale Carracci, Michelangelo and Raphael and established friendships with J. H. Füssli and the Swedish Neo-Classical sculptor, Johan Tobias Sergel whose work influenced his style. In 1776 he travelled to Naples to examine the new discoveries at Herculaneum and Pompeii. He returned to Denmark, stopping for a short stay in Paris, the following year.

In 1778, Abildgaard was made a member of the Copenhagen Academy, and shortly afterwards he was entrusted with the decoration of the hall in the Schloss Christiansborg. This project involved a large series of 22 allegorical paintings glorifying the history of Denmark and occupied Abildgaard from 1780 to 1791. Sadly, all his work was destroyed by fire in 1794 – an event that prompted Abildgaard to declare "There burns my name" – and all that remains are a few sketches. After the fire the royal family moved to the Amalienborg Palace where Abildgaard was commissioned to decorate the State Apartments. He designed every aspect of these interiors including paintings, furniture and draperies and, given a free hand in the choice of style, he reverted to Antique models. For political reasons he rejected the fashionable Empire style popularised by Percier and Fontaine in favour of a purer brand of classicism that was more akin to the geometric simplicity characteristic of early Neo-Classicism. Once again, however, his interiors did not last long. In 1810 the new king ordered the rebuilding of the Palace and Abildgaard's paintings were put into store where they remained for over a century. Fortunately, much of the furniture has survived.

Abildgaard's designs for furniture date from the last decade of the 18th and the first decade of the 19th century. They represent a highly personal interpretation of the Neo-Classical style and were strongly influenced by Antique fragments and decoration that he saw in Rome, Herculaneum and Pompeii. The furniture itself divides into two categories: that which was made for the future Christian VIII for the Amalienborg Palace, and that which he designed for his own rooms in the Christiansborg.

The oldest of the royal pieces is a throne ordered in 1806 for the Crown prince. Made of mahogany inlaid with lime-tree dolphin emblems and other decoration, and upholstered in shining silk, it was almost certainly executed by the royal cabinet-maker, Gottfried Abe. The rest of the furniture – a sofa, a writing cabinet and six stools – was also made of mahogany with lime-tree inlay and a few gilt bronze mounts. While the elements of all the designs derive from classical architecture, in each piece these are combined in a unique and unusual way. The wide sofa, for example, with its strong, outwardly curving side-arms and its absence of backrail, resembles a banquette more than a sofa. And its feet, with their turned balls, seem quite Baroque although the painted decoration and the lionhead mounts are clearly Neo-Classical. The lions are repeated in the X-shaped stools which derive from both ancient Roman models and French Baroque tabourets.

The furniture that Abildgaard designed for his own apartment, which included a commode, a writing cabinet and some chairs, is even more interesting. The most noteworthy are his Greek *klismos* chairs. Like Abildgaard's X-shaped stools, these chairs were extremely fashionable and coincided with the revival of ancient forms in furniture throughout Europe. A slightly earlier example of a *klismos* chair appears, for example, in a painting by Jacques-Louis David of 1789. Although Abildgaard knew and admired David's work, he is more likely to have been inspired by Scandinavian precedents. Through Sergel, he had connections with Sweden where Louis Masreliez had designed similar, severely Neo-Classical chairs for Gustaf III's Haga Pavilion in 1792. Abildgaard must also have become familiar with the *klismos* chairs depicted in

Antique reliefs during his stay in Rome. He designed two versions, the lighter of which closely follows antique models with pronounced outwardly curving legs and backrail. It is gilded and the backrail is decorated with palmettes in marquetry. The larger chair is Abildgaard's most eccentric piece of furniture. Made of beech veneered with mahogany, it has a relatively wide backrail that is decorated with scenes freely adapted from Passerio's *Picturae Etruscorum* (1767), a copy of which was in Abildgaard's extensive library. Somewhat awkwardly proportioned, it is meant to be seen from the front to allow a full view of the pictorial Etruscan scenes. Both chairs are now upholstered but originally they were designed to have only a loose, red cushion. Abildgaard's preoccupation with the *klismos* form is also demonstrated in two sketches for the paintings for Christiansborg where it is represented as a seat for the king.

Abildgaard's art was both scholarly and versatile, and whether in paintings or in designs, his motifs and models were selected from antiquity and books rather than from life. He exercised a significant influence on the next generation of artists and designers and also encouraged the future Christian VIII to become an important collector and patron of the arts.

PIA MARIA MONTONEN

Biography

Born in Copenhagen in 1743, the son of the painter Sören Abildgaard (1718–c.1800). Trained as a decorative painter under J. E. Mandelberg; enrolled at the Academy of Art, Copenhagen, from 1764. Won several medals between 1764 and 1767; awarded a travel scholarship, 1771; studied in Rome where he met the painter J. H. Füssli and the sculptor J. T. Sergel, 1772–77; visited Naples and Pompeii, 1776. Returned to Copenhagen via Paris, 1777. Active as a painter and made a Member of the Academy, Copenhagen, 1778: Director, 1789–91 and 1801–09. Commissioned to decorate Schloss Christiansborg, 1780–91; involved in the design of interiors, furniture and architecture from the 1790s. Died in Copenhagen, 1809.

Selected Works

Drawings for the decoration of the Royal Palace, Amalienborg, are in the Statens Museum for Kunst, Copenhagen. Examples of the chairs that Abildgaard designed for his own use are in the Museum of Decorative Arts, Copenhagen.

Interiors

- 1780–91 Schloss Christiansborg, Copenhagen (allegorical paintings and decoration for the Hall): Christian VIII of Denmark
- c.1795–1809 Royal Palace, Amalienborg (interiors and furnishings for the State Rooms): Christian VIII
- c.1800 Abildgaard Apartment, Christiansborg (interiors and furnishings)

Ackermann, Rudolph 1764–1834

British publisher and bookseller

Born in Stolberg, Saxony, Rudolph Ackermann was trained as a coachmaker and worked in Switzerland, France and Belgium before moving to London in 1783. Despite a moderate success in this early career, it is as a publisher of topographical books and the celebrated *Repository of Arts* (1809–28), that he is now primarily remembered. The *Repository*, in particular, played a leading role in the dissemination of fashionable taste in the first quarter of the 19th century. Generously illustrated with coloured lithographs, it represents an important record of Regency colour schemes and designs for furnishings, upholstery and interiors.

The "Repository of Arts" was the name first given to a shop selling prints, books and fancy articles that Ackermann opened in 1795 (Ackermann's continued to operate as successful art dealers until the firm was sold in 1992). According to the *Dictionary of National Biography*, this business was one of the first to be lit by gas, and Ackermann's strong interest in the innovative as well as the fashionable is similarly reflected in his championing of new print techniques such as lithography, and his publishing of scientific books such as Frederick Accum's *Practical Treatise on Gas-Light* (1815).

Ackermann's career as a publisher was well established by the early 1800s and some of his most popular and successful projects were topographical publications such as the *Microcosm of London* and *Ackermann's Cambridge*. These have also proved of great value to architectural and design historians as many of the buildings and interiors illustrated have since been altered or destroyed. For example, plates in the *Microcosm of London* include views of the interiors of James Wyatt's Pantheon (demolished 1937), the Foundling Hospital (demolished 1926) and the old House of Commons (destroyed 1834). However, the plates are of interest as much for Thomas Rowlandson's witty delineations of the Georgian society that inhabited these interiors, as for the interiors themselves. Not surprisingly, the *Microcosm* inspired an early Victorian imitation entitled *London Interiors*.

Ackermann: "Fashionable Furniture" from *The Repository of Arts*, vol. 13, plate 9, c.1809

The *Repository of Arts, Literature, Commerce, Manufacture, Fashions and Politics* was published monthly from 1809 and, as its somewhat cumbersome title suggests, it was initially intended to reflect very diverse interests. Similar magazines were already in circulation, particularly in Germany, and it is likely that Ackermann's publication was inspired, if not directly modelled upon, the *Journal des Luxus under der Moden* with whose editor Ackermann had corresponded between 1775 and 1803. It was an immediate success and attracted 3000 subscribers in the first year. The historian Peter Thornton has described the *Repository* as the "principal organ for bringing news of fresh fashion in interior decoration (among much else) to Regency England" and it included illustrations of almost every conceivable type of furnishing and numerous examples of drapery treatments and upholstery. It also included various novelties such as Atkinson's Hair Curling Fluid which was said to "impart a reviving odiferous perfume and keeps it in curl during the dance", and inventions like "Merlin's Mechanical Chair" for invalids and the "Metamorphic library chair", both of which were illustrated in 1811. The readership was drawn from most sections of fashionable society but from around 1816 the magazine was directed more specifically at a female audience and an increasing emphasis upon fiction and the arts replaced material relating to politics, science and medicine. This move perhaps reflects Ackermann's awareness of the growing importance of women as both arbiters of taste and consumers of home furnishings.

The *Repository's* dominant style was English Grecian with

contributions from major champions such as the architect John Buonarotti Papworth, the furniture designer George Smith, and the upholsterer John Stafford of Bath. In 1809 the magazine accompanied designs for a Grecian chaise longue and window seat with the following musings: "We observe with pleasure a more tasteful arrangement daily taking place; the gaudy colours of the chintz and calico furniture have given place to a more chaste style". These comments reveal the editor's sympathy with the new fashion and the view that the Greek style was synonymous with "taste". Papworth's contributions were reprinted as *Select London Views* (1816), *Rural Residences* (1818) and *Hints on Ornamental Gardening* (1823), the latter two representing important contributions to the Picturesque. In turn *Fashionable Furniture* (1823) was an anthology of designs whose principle source was the 1822 *Repository*. Ackermann's periodical was also responsible for bringing to a wider audience design books such as John Stafford's *A Series of Designs for Interior Decorations, comprehending Draperies and Elegancies for the Drawing Room* of 1814 which was reprinted in an abridged form in the *Repository* between 1819 and 1820.

Although dominant, the Grecian style was not promoted to the exclusion of all others. Egyptian ornament (which had enjoyed particular vogue following Nelson's victory at the Battle of the Nile in 1798) was praised for its decorative features, despite reservations in 1809 as to its inherent "barbarity". The *Repository* also reflected the continuing popularity in England for French design with the inclusion of furnishings in the Empire style. The Prince Regent's enthusias-

tic advocacy of French fashion and the subsequent popularity of Percier and Fontaine's *Recueil de décorations intérieures*, available in book form from 1812, meant that despite Ackermann's active dislike of the French Imperial regime, as a businessman and arbiter of fashion he could not ignore the demand for current French styles.

From 1825, the *Repository* became the vehicle for early Gothic designs by A.C. Pugin. Pugin had earlier been responsible for many of the engravings in Ackermann's topographical publications and his designs for the *Repository* were possibly produced with the assistance of A.W.N. Pugin, his precociously talented son. The 27 plates published between 1825 and 1827 were reissued by Pugin senior as *Pugin's Gothic Furniture* (1827). The *Repository* deemed Gothic a style particularly suitable for the Library as it "possesses a sedate and grave character, that excites the mind to study and reflection", and "the rays passing through its variegated casements cast a religious light upon the venerable tomes". The promotion of Gothic also extended beyond the *Repository* itself to include the publication of separate works by A.W.N. Pugin, such as his *Gothic Furniture in the Style of the 15th Century*, which was published by Ackermann and Co. in 1835 after Ackermann's death. This book was significant in the history of the Gothic Revival not only as Pugin's first independent published work but also for the scholarly nature of the designs. Other Pugin publications produced by Ackermann and Co. include the *Designs for Iron and Brass Work in the Style of the XV and XVI Centuries* and *Designs for Gold and Silversmiths*, both published in 1836.

JACQUELINE RIDING

Biography

Born in Stolberg, Saxony, 20 April 1764, the son of a coachmaker. Moved to Schneeberg, 1775. Trained under his father, and practised as coachmaker in Switzerland, France and Belgium. Settled in London, c.1783. Active as coachmaker until c.1793. Married an English woman, c.1793–95. Opened shop, The Repository of Arts, at the first of several addresses in the Strand, 1795. Patented water-proofing method; built factory in Chelsea, 1801. Opened drawing school, 1806. Published *Microcosm of London*, 1808–10. Published monthly magazine on art, science and fashion, *The Repository of Arts*, 1809–28, including the work of contemporary furniture designers. Set up lithographic press at his shop, 1817, donating one to Society of Arts, 1819. Visited Aloys Senefelder in Germany, 1818; translated Senefelder's *A Complete Course of Lithography*, 1819. Patented moveable carriage axles, 1820. Involved in anti-Napoleonic propaganda, 1807, and in charitable work in Germany from c.1813. Gained Order of Merit from king of Saxony, 1827. Married second time, 1830. Suffered a stroke, 1830. Died in Finchley, 20 March 1834. Eldest son Rudolph (d. 1868) continued business.

Publications

The British Library, London, and National Art Library at the Victoria and Albert Museum, London, hold complete runs of *The Repository of Arts*. For a discussion of the series' influence and a detailed commentary on selected plates see Agius 1984.

Adam, Robert 1728–1792

Scottish architect and designer

The style consciously perfected by Robert Adam and his brothers was to prove among the most popular and widely influential in British interior design. Largely derived from an unprecedented range of classical sources, it provided a system of ornamental design and varied decorative vocabulary readily applicable to virtually every aspect of the decorative arts, particularly within the integrated interior. Moreover, this fashionable style was generated by means of a large number of commissions, using a highly organised office and disseminated through a carefully devised publicity campaign, as epitomised by the publication *Works in Architecture of Robert and James Adam*. While the style dominated British design from the early 1760s to the 1780s, it was to be superseded by the more severely restrained and archaeologically-based Neo-Classicism of Henry Holland, Charles Heathcote Tatham and other designers of the Regency.

Robert was trained by his father, William Adam, then the leading architect in Scotland, along with his brothers John (1721–92) and James (1732–94) – a much younger brother William (1738–1822) was to support the family business later as their contractor – in a vigorous style which blended the fashionable Palladian manner with considerable elements of Vanbrugh's Baroque. Robert's early decorative work, exemplified by interiors carried out at Hopetoun House, near Edinburgh (c.1754), after his father's death, is in a conventional Rococo idiom, and accompanied by contemporary projects for Gothic landscape structures in the manner of Batty Langley. All this was to be dramatically transformed by a period of intense study in Italy (1754–58). During this time he was swift to assimilate an exceptionally wide range of architectural and ornamental forms which ranged from ancient

Adam: anteroom, Syon House, Middlesex, c.1761-69

Rome (including certain debts to the new discoveries at Herculaneum) to the Mannerist vocabulary of the *Cinquecento*, particularly the grotesques in stucco and paint of Raphael's Villa Madama and the Vatican *loggia*, as well as the dynamic spatial language of the Baroque. While Robert was tutored in the latest fashions of draughtsmanship and ornamental composition by the French architect C-L. Clérissieu, it was undoubtedly the Venetian designer G.B. Piranesi's liberating system of composition through architectural fantasy which showed him the means of creating a new and eclectic contemporary style. After a brief study of potential material among the remains of Diocletian's Palace at Spalato (the modern Split), later published in a sumptuous folio in 1764, he returned to Britain in 1758 to open an office in London and James took his turn in Italy. In their developing partnership, Robert was to prove the creative force while James acted in a subordinate role, drafting their aesthetic "credo" in the *Works*, and their elder brother John provided essential capital from the family estate at Blair Adam, near Edinburgh.

Throughout the 1760s Robert Adam, given the lack of totally new commissions, reconstructed a number of interiors in an impressive group of country houses, including Hatchlands, Shardeloes, Croome Court, Bowood, and Harewood. Above all, it was to be at Kedleston Hall (1760–c.70) and Syon House (1761–69) that he produced a sequence of monumental interiors that remain his masterpieces in recreating the patrician architecture of Antiquity, allied to a keen understanding of contemporary needs. These qualities are exemplified at Kedleston by the spatial transition from the top-lit columnar hall (atrium) to the circular domed saloon (vestibulum), and at Syon by the equally scenic progression from entrance hall, via the sumptuous anteroom, dining room, and red drawing room to the cleverly adapted long gallery. This formal language, which is also brilliantly handled at Osterley Park (1762–72), if on a comparatively less grandiose scale, involves a sequence of skilfully modulated spaces, changes of level, tone, lighting and texture which express the dynamic property of Adam's key concept of "movement". Meanwhile, his handling of ceiling as well as chimney-piece design gradually developed away from a bold expression in form and ornament to a far more refined treatment in accord with his continuing study of antique sources, particularly taking into account publications of the emerging Greek Revival as well as discoveries in remote sites such as Palmyra and Baalbek. Similarly, with the design of furniture in keeping with these classicising interiors, Adam's designs for tables, seat furniture and mirrors show an increasing capacity for invention and the ingenious application of motifs which reflect wall and ceiling ornaments within the same space.

While he owed much to pioneers of the integrated interior *al antica*, such as William Kent and Adam's contemporary and rival, James Stuart, never before had walls, ceilings, chimney-pieces, floor surfaces and carpets, as well as door-furniture and light fittings, been orchestrated with such a cumulative effect, particularly using a highly original range of colour schemes (an extremely controversial issue in modern restorations). Major examples of this skilful integration of a variety of decorative arts can be seen in the music room at Harewood and the drawing room at Osterley. In achieving such coordination Adam was to rely on an exceptional team of artists and crafts-

men including the plasterer Joseph Rose the Younger, decorative painters such as Cipriani, Pergolesi, Biagio Rebecca and Antonio Zucchi, sculptors such as Spang and Wilton, cabinet-makers such as the Linnells, Ince and Mayhew (and, less so, Chippendale), manufacturers in metal such as Matthew Boulton, carpet-makers such as Thomas Moore and, on rare occasions, Josiah Wedgwood, to mention but a few. Equally essential, if intentionally concealed by the brothers, was the team of draughtsmen responsible for producing the formidable quantity of detailed drawings, a large proportion of them in colour (some 9,000 survive in Sir John Soane's Museum), which included George Richardson, Agostino Brunias, Joseph Bonomi and Giuseppe Manocchi.

By the late 1760s, in addition to the other major country houses remodelled, such as Kenwood (with its lavishly monumental library), Saltram, Nostell Priory and Newby (including a pioneering sculpture gallery), the established Adam family firm now embarked upon an ambitious programme of town houses in London, of which the two best surviving are Wynn House, 20 St James's Square (c.1772–74) and Home House, 20 Portman Square (1775–77). In these commissions Robert succeeded in enhancing the narrow confines of the standard Georgian terrace house by means of a sequence of lavish rooms of parade in which he improved on traditional room shapes with the help of apses and screens of columns, segmental ceilings, and an extensive use of mirrored surfaces. The principal floors were connected by means of highly scenic staircases, owing much to Kent's magnificent precedent at 44 Berkeley Square and produced in conscious rivalry to William Chambers's ambitious staircase at Melbourne House (1771–74). By now, the sheer delicacy and increasingly shallow relief of the Adams' geometrically-devised plaster ceilings began to attract as much criticism as their external use of stucco ornament on otherwise unrelieved brickwork. Equally remarkable were a series of chimneypieces, owing much to Piranesi's own eccentric designs for such features, recently published in his influential *Diverse maniere d'adornare i cammini* of 1769. The use of cast-iron balustrades among the fittings within these houses reveals the growing exploitation of industrial mass-production by the Adams, paralleled by the extensive use of artificial materials, such as *scagliola*, and, externally, the use of Coade stone and Liardet cement. The ultimate expression of this entrepreneurial principal of standardization within the Adam style can be seen in the ill-fated speculative housing venture of the Adelphi (1756–72). This luxury housing overlooking the Thames near Charing Cross, despite its grave financial problems, was to set important patterns for the expansion of 19th-century London. When this exceptional development was largely demolished in 1936, a ceiling and chimneypiece from Garrick's rooms in 5 Adelphi Terrace survived to be recreated in the Victoria and Albert Museum.

The Adam achievement by the mid-1770s was to be summed up and expounded by means of the plates and accompanying texts of the exceptional publication – *Works of Architecture of Robert and James Adam*. In this work, which initially appeared in instalments and was later reissued in the form of three lavishly illustrated folio volumes, the authors claimed "to have brought about ... a kind of revolution in the whole system of English architecture" and "to have been able

to seize ... the beautiful spirit of antiquity, and to transfuse it with novelty and variety". The ingenious use of detailed as well as general plates advertising the Adams' novel decorative vocabulary, was, in itself, to promote a host of imitations in designs of all kinds.

Meanwhile, a serious threat to the brothers was now offered by the young James Wyatt. In response, the mid-1770s involved a new phase of stylistic experiments as exemplified by the suite of new state rooms at Osterley, added by Robert Adam between 1772 and 1780. These included an anteroom incorporating a specially-ordered set of Gobelin tapestries (other such tapestry rooms were created for Croome Court, Moor Park and one, still *in situ*, at Newby), a particularly ingenious state bedchamber, and, most remarkable of all, a painted dressing room in the Etruscan Style (at least a further eight such rooms were produced, the only one of which to survive in part is at Home House), combining inspiration from Piranesi, Wedgwood and Pompeian wall decorations. Other equally idiosyncratic designs included the Glass Drawing Room at Northumberland House, London, of 1770–75 (also partly reassembled in the Victoria and Albert Museum after the main building was demolished in 1874) which had green-painted glass for pilasters, frieze, and dado, with the main glass walls coloured red to simulate porphyry.

The last ten years of Robert's career were largely confined to Scotland where he continued a number of long-awaited official commissions, such as the Register House, Edinburgh, begun in 1774 and incomplete at his death (this retains one of his rare public interiors). On the domestic front, he contributed to the development of the New Town (a well-preserved example of a typical Adam interior, created in 1791, can be visited at 7 Charlotte Square). At the same time he continued to innovate with designs for an exceptional variety of castle-style mansions, only a few of which were executed. He had already tried his hand at the Gothic Revival with a surviving interior for Horace Walpole at Strawberry Hill, Twickenham (c.1766), and later work at Alnwick Castle (c.1770–78, since demolished). However, the interiors of these mock-medieval castles, in marked contrast to the powerfully austere abstraction of their exteriors, as notably seen at Culzean Castle on the Ayrshire coast (c.1778–90), continued to be fashioned in the delicately restrained classical style of the previous decade.

Biography

Born in Kirkcaldy, Fife, 3 July 1728, son of the architect William Adam (1689–1748); his brothers included the architects John (1721–92) and James (1732–94), and the building contractor William (1738–1822). Educated at Edinburgh High School, 1743; apprenticed to his father 1746–48; in partnership with John and James from 1748. Travelled in Italy, 1754–58; studied drawing with Charles-Louis Clérissieu (1721–1820); travelled with him to Rome and met G. B. Piranesi (1720–78); visited Naples and Herculaneum, and Venice, and studied the ruins of Diocletian's Palace at Spalato (Split), 1757. Returned to England and established an office of the Adam firm in London, 1758; served as architect of the King's Works, 1761–69; surveyor of Chelsea Hospital, London, 1765. Active also as a designer of painted decoration and plasterwork, furniture, carpets,

and metalwork from the 1760s. Fellow: Society of Arts, 1758; Society of Antiquaries, 1761; Royal Society, 1761. Elected Member of Parliament for Kinross, 1769. Died in London, 3 March 1792.

Selected Works

Approximately 9,000 drawings by Adam and his staff, including many sketches relating to the decorative projects, are in Sir John Soane's Museum, London. Smaller numbers of drawings are in the Drawings Collection, Royal Institute of British Architects and the Victoria and Albert Museum, London, and in the Metropolitan Museum, New York. The Metropolitan Museum also houses the dining room from Shelburne (later Lansdowne) House and the tapestry room from Croome Court, Hereford; the drawing room from Shelburne House is now in the Philadelphia Museum of Art. Documents and additional drawings can be found in the archives of several Adam houses including Kedleston Hall, Nostell Priory, Osterley Park and Saltram. An important collection of Adam furniture is in the Victoria and Albert Museum.

Interiors

- 1750–57 Hopetoun House, Newton, Lothian (alterations and interiors including the hall, dining room, drawing room and State bedroom): 2nd Earl of Hopetoun
- 1760–c.70 Kedleston Hall, Derbyshire (remodelling and interiors including the hall, saloon, dining room, music room, drawing room and library): 1st Lord Scarsdale
- c.1761–69 Syon House, Brentford, Middlesex (remodelling, furnishings and interiors including the hall, anteroom, dining room, red drawing room, gallery, closet and green dining room): 1st Duke of Northumberland
- c.1761–80 Osterley Park, Middlesex (alterations, portico, and decoration and furnishing of most of the main rooms including the hall, staircase, eating room, library, drawing room, tapestry room, state bedroom and Etruscan dressing room): Francis and Robert Child
- c.1762–67 Shelburne (later Lansdowne) House, Berkeley Square, London (building and interiors including the hall, staircase, drawing room and dining room): 3rd Earl of Bute and 1st Marquess of Lansdowne
- 1764–79 Kenwood House, Hampstead, London (remodelling, additions, furniture and interiors including the hall, staircase, anteroom and "great room" or library): 1st Earl of Mansfield
- 1765–72 Harewood House, West Yorkshire (decoration of the ground floor rooms including the hall, saloon, library, state bedroom and dressing room, gallery, drawing room, dining room and music room): Edwin Lascelles, 1st Lord Harewood
- 1766–80 Nostell Priory, West Yorkshire (furniture and interiors including the upper hall, library, tapestry room and saloon): Sir Rowland Winn
- 1766–81 Alnwick Castle, Northumberland (decoration including the saloon, drawing room, dining room, banqueting room and library): 1st Duke of Northumberland
- 1767–76 Newby Hall, Ripon, North Yorkshire (furnishings and decoration including the hall, study, tapestry room, dining room and sculpture gallery): William Weddell
- 1768–69 Saltram House, Devon (furnishings and decoration including the great drawing room and library): John Parker, 1st Lord Bovingdon
- c.1770–78 Mellerstain, Gordon, Scotland (additions and interiors including the library, dining room, drawing room, bedroom and hall): Hon. George Baillie
- c.1772–74 20 St. James's Square, London (building and interiors including hall, dining room, music room, staircase well, anteroom, back drawing room and dressing room): Sir Watkin Williams-Wynn
- 1775–77 Home House, 20 Portman Square, London (building and interiors including the library, back and front parlours,

Etruscan bedroom, drawing room and music room):
Countess of Home

c.1778–90 Culzean Castle, Maybole, Strathclyde (building and interiors including the armoury, dining rooms, staircase, saloon, drawing rooms, picture room and best bedrooms)

Aesthetic Movement

The Aesthetic Movement of the 1870s and 1880s was a cult of beauty. Not so much a style as a philosophy, the movement defined beauty as an independent vital force that transcended religious, historical and geographic boundaries. Aestheticism emphasized the need for beauty in everyday life, and sought to introduce art to every home. It advocated the cultivation of good taste, and the creation and informed enjoyment of artfully embellished domestic goods. These goods were often known as "Art Furnishings", and Aestheticism and Art Furnishings were closely allied.

Aestheticism had a tremendous impact on British and American interior design of the late 19th century, and exerted influence on virtually all levels of society. Aesthetes argued that beauty uplifted the spirit and mind. In *The Book of American Interiors* (1876), Boston tastemaker Charles Wyllis Elliot foresaw a halcyon day when "in every house, the Beautiful married to the Useful shall make life truer, finer, happier". Women were urged to create homes that were places of spiritual renewal and refuges for their menfolk from the materialistic world of business. Furthermore, a tastefully decorated home would refine the minds of children, enhance the work of servants, and, as a microcosm of society at large, elevate the national culture. Such theories placed tremendous pressure on home decorators, assigning almost overwhelming importance to the choices they made. The Household Art Movement counterbalanced that pressure by disseminating the principles of Aestheticism, and helping consumers to create artful interiors of their own; scores of advice books and art journals were published. Charles Locke Eastlake's *Hints on Household Taste* (1868) was perhaps the most influential of these manuals, soon to be joined by many others, such as the *Art at Home* series edited by W.J. Loftie (1876), and *The House Beautiful* (1878) by Clarence Cook.

Aestheticism evolved from emerging liberal philosophy, as

Aesthetic Movement: bedroom, Château-sur-Mer, Newport, Rhode Island, designed by Seth Bradford, 1851-52 and remodeled by Richard Morris Hunt, 1871-78, for George Peabody Wetmore

well as from the campaign to reform British design. As a reaction against prevailing Victorian bourgeois values, the Aesthetic Movement offered art as an antidote to vulgar materialism. It urged that the pursuit of beauty be given equal, if not greater, importance than the philistine pursuit of wealth. Art was lauded as the highest form of action, complete unto itself, existing for its own sake. Indeed, in his preface to *Mademoiselle Maupin* (1835), the poet Théophile Gautier argued that if art is created to serve any extrinsic ends, then its aesthetic value is diminished. This doctrine stood in stark contrast to traditional criticism that focused on the moral, narrative, and didactic qualities in works of art. James McNeill Whistler's 1878 libel suit against critic John Ruskin dramatized this clash of aesthetics. Ruskin had been outraged by Whistler's painting *The Falling Rocket*, and condemned it as an act of conceit, akin to "flinging a pot of paint in the public's face" (*Fors Clavigera*, July 1877). Whistler, a flamboyant, articulate polemicist for Aestheticism and an acquaintance of Gautier's, countered with the argument that paintings are independent visual sensations in which subject matter is irrelevant. The case was followed exhaustively in the press, and popularized the tenet of "art for art's sake", as well as the wit and extravagance of its leading proponents.

Calls for the reform of British design dated to the 1840s. They became more strident following the Great Exhibition of 1851, when the design failings of contemporary British manufactured goods were displayed for all to see. Overblown and ponderous, overwhelmed with ornamentation, the exhibited goods prompted the establishment of the South Kensington Museum and Design School. Led by Henry Cole, the museum's mission was to expose British designers to the history of art and instill in them principles of proportion and color harmony. On its faculty were Owen Jones and Christopher Dresser, who championed the use of two-dimensional patterns for the decoration of flat surfaces like carpets and wallpapers; they believed realistic ornamentation in such cases was dishonest. Jones was a student of decorative patterning. His *The Grammar of Ornament* (1856) illustrated stylized interpretations of various historical and national decorative styles, and outlined general rules for ornamentation. He argued that elements of decoration from different styles could be brought together according to these "grammatical" rules, so as to create new ornamental languages. In the process, decorative motifs were divorced from prior symbolism or historical association. This free appropriation and mixing of styles was to be a hallmark of aesthetic interior design.

Design reform was also applied to furniture. Critics valued the honest expression of both construction and materials, qualities they saw inherent in objects from the middle ages. The Modern Gothic style of the 1860s–mid 1870s reinterpreted medieval design, creating rectilinear, relatively simple, pieces of furniture, often decorated with incised, stylized ornamentation. This style was popularized by Bruce Talbot's *Gothic Forms Applied to Furniture, Metal Work and Decoration for Domestic Purposes* (1868). In turn, Talbot's work inspired the Art Furniture created by Americans Frank Furness and Daniel Pabst of Philadelphia, as well as Kimbel and Cabus of New York. Charles Eastlake's *Hints* also was extremely influential; indeed, the Modern Gothic style in America came to be called the Eastlake style.

Some critics believed that both contemporary designs and contemporary means of manufacture needed reform. Leaders of the Arts and Crafts Movement, such as William Morris, sought a revival of hand craftsmanship; they rejected mass-production and suggested a return to the medieval system of guilds. Morris's hand printed wallpaper and textile patterns proved tremendously popular in Aesthetic circles. Their stylized natural forms, sense of organic, rhythmic growth, and use of natural dyes were much in demand to decorate artful interiors on both sides of the Atlantic.

Morris drew on the talents of his friends in producing designs for his firm and, also, in designing the interior of his home, the Red House at Bexleyheath, built in 1859; painters Edward Burne-Jones and Dante Gabriel Rossetti, and architect Philip Webb all worked on the Bexley Heath project. They painted murals on otherwise plain walls, and created ingenious built-in furniture, including a combination cupboard, settle, and minstrels' gallery. Later in the 19th century, built-in furniture found favor among homeowners with Aesthetic pretensions; inglenooks and window-seats were popular, while arch-aesthete Oscar Wilde's London dining room of 1885 featured a sideboard built-in around much of the room.

That painters used their skills in the production of decorative arts had much to do with the influence of John Ruskin. In *The Seven Lamps of Architecture* (1849) Ruskin extolled the virtues of surface ornamentation, describing it as a force for good. He believed that the decorative arts should be given a status equal to the fine arts. Designers and architects began to see themselves as artists, and aesthetic considerations became central to their creations. Painters, poets, and designers mixed socially, and Art Furnishings benefited from their collaborations. In New York City, social clubs like the Century, Lotus, and Grolier brought artists, authors, and patrons together, while the Tile Club was founded by painters like Winslow Homer, who experimented in decorating ceramics.

Perhaps the most famous painter-decorator was Whistler. In 1876 he was commissioned to decorate the London hall and stairway of shipping magnate Frederick Leyland. He embellished those interiors in brown and gold, before reworking the dining room, where his painting *La Princesse du Pays de la Porcelaine* was displayed. The dining room had just been completed by noted designer Thomas Jeckyll, yet Whistler's decorative scheme was largely unrelated to his work. He painted over the antique Spanish leather wall-coverings, in a composition he described as *Harmony in Blue and Gold*. Using colors derived from a peacock's plumage, he also created a mural of peacocks, arranged in the manner of a Japanese screen. Gilded ribs and shelves divided the walls, evoking a Japanese shrine, while allowing the display of the Leyland collection of Oriental porcelain. Whistler conceived of the room as a single, harmonious composition in which his painting was an important, yet not predominant, part. Characteristic of interiors with Aesthetic ambiance was the refined arrangement of each element in a room so that none detracted from the cultivated vision of the whole.

Japanese art and design were instrumental in the evolution of the Aesthetic Movement; their influence extended from the composition of paintings to the arrangement and design of furniture. The first comprehensive public display of Japanese goods in the West was part of the 1862 International

Aesthetic Movement: sideboard by E.W. Godwin in ebonised wood with embossed papier-mâché panels and silverplated fittings, c.1867

Exhibition held in London. Textiles, ceramics, lacquer-ware, prints and furniture crowded the exhibition. Critics lauded the simplicity and refined beauty of the everyday objects; they praised their asymmetry, precision, and delicacy of color. They perceived in Japanese goods the very qualities they appreciated in medieval design: stylized surface ornamentation, rectilinearity, and handcraftsmanship.

Following the Exhibition many of the goods from the Japanese display were offered for sale; Farmer and Rogers Oriental Warehouse sold a large selection. Whistler, Rossetti,

Burne-Jones, and E.W. Godwin are all thought to have bought Japanese objects at that time. Similarly, a number of Japanese curio stores opened in Paris. One shop, owned by Mme. Desoye, became a meeting place for young artists, including Whistler, James Tissot, and Baudelaire.

Designers soon incorporated elements of Japanese art into their work. The term "Anglo-Japanese" describes English designs distinguished by Japanese-inspired asymmetry, delicate line, light construction, attenuation, and interplay of solids and voids. The style was developed by E.W. Godwin. Characterized

by essayist Max Beerbohm as “the greatest aesthete of them all”, Godwin decorated his Bristol townhouse in 1862 with Japanese prints, Persian rugs on bare floors, and a few thoughtfully arranged pieces of 18th-century furniture. Later, Godwin moved to London, where he enlarged the Japanese effect of his decor by using straw-colored matting on his drawing room floor and dado. Wicker chairs with Japanese-patterned cushions provided seating. Art Designers occasionally made furniture from wicker, cane, and bamboo, materials which carried undertones of the exotic East. Lightweight and easy to move, such furniture was well-suited to the freer room arrangements of the 1870s and 1880s.

Godwin also designed furniture for himself. For reasons of economy this was constructed in deal which was then ebonised to suggest the appearance of lacquer. His sideboard of c.1867 is one of the earliest and most extreme examples of Anglo-Japanese furniture. Inspired by the wooden fittings illustrated in Japanese prints, its form is tightly rectilinear and its beauty rests in the simplicity of its shape and the careful juxtaposition of solids and voids. This and numerous other pieces were sold by William Watt and were illustrated in his catalogue *Art Furniture from Designs by E. W. Godwin ... and Others* (1877).

Many other designers were also drawn to the geometry and abstraction of Japanese goods. Christopher Dresser, for example, produced wallpapers, textiles and furniture in the Anglo-Japanese style. Unlike most of his contemporaries, Dresser's appreciation of Japanese art was informed by a close understanding and thorough knowledge of the culture of Japan. In 1876 he travelled to Japan, where he studied the indigenous art and architecture, and collected a group of objects for the design study collection at Tiffany and Company in New York. Tiffany subsequently sold the items that did not fit into their collection to the public.

The art of Ancient Greece and Egypt were also important influences on Aestheticism, particularly in the later 1870s and 1880s. The impact of late 19th-century classicism was especially strong in the fine arts where classical and mythological subjects were popularized by painters such as Frederic Leighton and Albert Moore, but it also influenced the design of furniture, decoration and even Aesthetic dress. Godwin, for example, designed a range of Greek furniture, illustrated in the *Building News* of 1885, whose bulbous turned legs and incised gilt decoration precisely match museum notes in his sketchbooks, and another of his Greek chairs made by Watt in plain oak was advertised in 1884 as a “Cheap Chair”. Similarly, an ebonized armchair illustrated in Dresser's *Principles of Decorative Design* (1873) is described as being “in the Greek style”, and much of the incised ornament in other examples of his furniture is clearly indebted to antique precedents. The work of Dresser and Godwin also reveals an interest in Egyptian styles, as did that of several other artists and designers. Ford Madox Brown had designed an “Egyptian” chair for William Holman Hunt in 1857 which was the antecedent of a varied line of Thebes stools patented by Liberty's in 1884 and which were still being produced well into the 1920s. Liberty's also sold a range of Egyptian accessories in its Arab Tea Rooms and specialized in “Moorish” furniture incorporating panels of imported *musharabeyeh* latticework. Items such as small tables

and screens provided an exotic note which proved increasingly popular in Aesthetic homes.

American decorators embraced Japonisme in the 1870s. Of particular note is the work of Herter Brothers of New York, who imported Japanese objects, and created beautifully crafted marquetry furniture in the Anglo-Japanese style. Herter Brothers' most spectacular Japanese-inspired commission was the parlor they created for William H. Vanderbilt's New York house in 1882. The parlor evoked Whistler's *Peacock Room* in its elaborate series of light display shelves, and also featured red-lacquered beams, a gilded bamboo frieze, and a chimneypiece that suggested the entrance to a Japanese temple.

In America, the Philadelphia Centennial Exposition of 1876 catalyzed the spread of Aestheticism. Over ten million people streamed through the exhibition, where they were exposed to a vast array of art objects from around the world. The Japanese section both displayed and sold Japanese goods, while the British display featured room settings decorated in a variety of styles, including the Jacobean and the newly popular Queen Anne. A cast- and wrought-iron pagoda designed by Thomas Jeckyll was also part of the British exhibition. Jeckyll surrounded this structure with a railing composed of stylized iron sunflowers. The sunflower was a virtual icon of the Aesthetic Movement and a favorite motif of Jeckyll's. It appeared on sets of andirons he designed, one of which decorated Leyland's Peacock Room.

Aestheticism was popularized further in America by Art Furnishings retailers and by the occasional appearance of figures from the British Aesthetic Movement. In 1873 the London merchant Daniel Cortier opened a New York branch of his firm, specializing in furniture and stained glass by designers such as Godwin and Morris. Christopher Dresser gave a series of art lectures in the United States, while Oscar Wilde was notorious for his posturing eccentricities when he toured the country and described his vision of the House Beautiful in 1882–83.

Few critics or homeowners shared the same vision of domestic beauty. Aestheticism emphasized the free expression of refined taste, and individuals used widely different criteria in selecting decoration for their homes. Interiors that reflected the pure principles of Japanese simplicity and restraint were rare, existing more in theory than in practice; Godwin's design of his own rooms came perhaps closest to the Aesthetic ideal. Other decorators were less extreme, and created rooms that were more artful than purely Aesthetic. While there was no unity of style, the iconography of the Aesthetic Movement was standard: the lily, poppy, sunflower, feather, fan, peacock, Sussex chair, and blue and white china were all hallmarks of Aestheticism. In addition, very broad trends in decorating emerged. An eclectic taste for works of art from all times and places, a use of flat, stylized patterns divided by borders, an enthusiasm for collecting and display, a *horror vacui*, and a complex layering of patterns, textures, and art objects characterized artful decorating. Tertiary, subtle colors were used in many Aesthetic interiors; Oscar Wilde described such colors as “a reaction against the crude primaries of a doubtless more respectable but certainly less cultivated age” (letter to the *Daily Chronicle*, 30 June, 1890). Household Art literature advocated the creation of a series of cosy seating areas, which were seemingly casual, yet carefully planned; screens, parasols,

inglenooks, and bay windows were suggested tools for defining separate conversation areas. Aesthetes fashioned art corners, where harmoniously grouped, diverse objects of beauty pleased the cultivated eye and enhanced the composition of the room at large. Eastlake called for shelves to be built above the fireplace, so that a "mantle museum" of collectibles was formed.

Inevitably, decorators reacted against the visual complexity of such interiors. Color schemes lightened and brightened, and eclecticism diminished. In both England and America, designers of the 1880s revived the styles of the 18th century; these developments followed the rediscovery of 17th and 18th century domestic vernacular architecture, notably by Richard Norman Shaw and William Eden Nesfield. Manufacturers made reproduction Queen Anne and Colonial Revival furniture, and antiques were in great demand. The owner of antiques was assigned qualities such as a refined taste and informed discrimination, as well as good breeding and wealth.

Rapacious collectors, foppish Aesthetes and intense connoisseurs all were widely parodied in satirical journals like *Punch*. George du Maurier caricatured both Whistler and Wilde in a series of cartoons featuring the long-haired painter Jellaby Postlethwaite and the poet Maudle, endowing them with posturing affectations and an insatiable passion for Aesthetic icons such as lilies and blue and white china. Wilde's favored attire, knee britches and floppy ties with large flowers at his lapel, was also lampooned. Gilbert and Sullivan's opera *Patience* (1881) brought further attention to the eccentricities of the Aesthetic Movement. Their protagonist Reginald Bunthorne, a poet and posing aesthete, describes himself as "a Japanese young man, a blue and white young man, a greenery-yallery, Grosvenor-Gallery foot-in-the-grave young man". Wilde took such satire in good part, and welcomed the notoriety it gave him. Indeed, his American lecture tour was organized by Richard D'Oyly Carte, the producer of *Patience*, to coincide with the New York opening of the opera.

Aestheticism attracted condemnation as well as satire. The Aesthetes' philosophy that art is the goal of life was denounced as pagan and amoral. Their flamboyant lives were dismissed as decadent self-indulgence. Perhaps the most scathing criticism of the Aesthetic Movement appeared in Henry James's *The Portrait of a Lady* (1881). James describes the Aesthete Gilbert Osmond as an avid collector with a passion for Japanese porcelain, yet a genius only for upholstery. Osmond's attempts to make his own life a work of art expose him as trivial and self-absorbed.

Selected Collections

Notable examples of Aesthetic interiors in England survive at Cragside, Northumberland, and in the Refreshment Room in the Victoria and Albert Museum, Leighton House, and Linley Sambourne House, London. Examples of Aesthetic interiors in America can be seen in the Mark Twain House, Hartford, Connecticut; Olana, Hudson, New York; Château-sur-Mer, Rhode Island; and the Peacock Room in the Freer Art Gallery, Washington, DC. Numerous items of American Aesthetic style furnishings are in the American Wing, Metropolitan Museum of Art, New York.

Aitchison, George 1825-1910

British architect and designer of furniture and interiors

Born into a family of successful City architects, George Aitchison rose to the very top of the architectural profession. A highly respected scholar and authority on historic ornament,

Aitchison: drawing of staircase hall, 44 Belgrave Square, London, 1869

he was made President of the Royal Institute of British Architects in 1896 and by his death he was internationally renowned as one of the foremost members of the architectural establishment. Yet Aitchison's architectural output was actually quite small and his reputation rested far more upon his achievements as an interior decorator than as a designer of buildings. In this capacity he worked for a small but influential group of wealthy, artistically-conscious clients for whom he created customised interiors that featured striking combinations of strong colours, gilding and decorative ornament. Always closely in touch with fashionable and progressive

tastes, his work represents Victorian Aestheticism at its most opulent and epitomises the most splendid examples of the late 19th century "House Beautiful".

Aitchison's training in the offices of the St. Katherine's Dock Company provided a solid grounding in the skills of engineering and surveying, and an early commission, for 59-61 Mark Lane, London (1864), indicates a precocious and, at the time, radical interest in the structural possibilities of cast- and wrought-iron. But of much greater significance, certainly as far as his interiors were concerned, was the long tour of Italy that he made between 1853 and 1855 where his eyes were opened

to the potential of decorative polychromy through his study of early Renaissance architecture and the work of Italian fresco painters such as Cimabue and Giotto. In Italy he also met a group of architects and artists with whom he formed lifelong friendships. These included William Burges, Alfred Waterhouse, and Edward Poynter, and, most importantly of all, the painter Frederic Leighton whom he met in Rome in 1853, and who commissioned his most celebrated work, Leighton House, in 1864.

Situated in Holland Park Road, Kensington, Leighton House was the first of many large detached studio houses that were erected in the last quarter of the 19th century and whose size and magnificence were designed to underline the artistic prowess and professional status of their successful Royal Academician owners. Leighton House was to become the most well-known and admired of these Palaces of Art but the exterior was, initially at least, fairly restrained. Built of red Suffolk brick with mouldings of light Caen stone, its design echoed that of an Italian Renaissance villa and, with the exception of some classical detailing on the mouldings and the large studio window that dominates the north, garden front, there were few embellishments to attract the eye.

The interiors, by contrast, were far more imposing and on entering the building the visitor was immediately struck by the profusion of boldly contrasting colours and the richness of the decorative materials employed. Iridescent turquoise blue tiles, produced by William De Morgan in 1879–81, covered the walls of the staircase and hall, and the dining room and drawing room were decorated in striking shades of Indian red and tobacco brown. The woodwork in these rooms and throughout the rest of the house was ebonised, and classicizing details, such as rosettes and linear arabesque ornament, on the cornices and door-frames were incised and picked out in gold, forming a dramatic contrast with the gleaming black ground. Upstairs, the studio was painted a deep terracotta, Leighton's preferred colour for the display of paintings. At the east end a large galleried screen containing a number of compartments and cupboards designed to accommodate the artist's easels and brushes, was painted peacock blue and an apsed semi-dome at the opposite end of the room was decorated with gold leaf. Many of these features, like the use of dark wood and the rich colour schemes, were repeated in other commissions and reflect the widespread preoccupations of Aesthetic taste. But certain of the details, in particular the etiolated forms of the staircase balusters, the marble fireplaces ornamented with stencilled decoration or inlaid with serpentine scrolls, and the decoration of the mouldings, were both highly personal and unusual.

Originally, the accommodation consisted of three ground floor rooms and a studio and bedroom on the first floor – Leighton, a bachelor, did not want to encourage overnight guests. However, both the client and architect had always intended to extend and in 1870 Aitchison enlarged the studio incorporating two Arab-style stained glass windows. In 1877 he was called in again to add a library and the Arab Hall.

The Arab Hall is arguably Aitchison's masterpiece. Designed as a showcase for Leighton's priceless collection of 16th- and 17th-century Syrian and Isnik tiles, the room was modelled on a reception hall in the 12th-century Moslem palace of La Zisa, near Palermo, Sicily, that Aitchison had

visited with Burges in 1854. Its typically Moorish features include the arched window recesses, squinches and the large pendentive dome. Carved lattice wood screens cover the windows and an 18th-century *zenana*, or harem-screen, was placed above the entrance to the hall. The tiles themselves were set into the walls. The antique elements were skilfully fitted into the architectural shell and contemporary artists were engaged to design new work. Aitchison designed the capitals of the marble columns – carved by the sculptor Edgar Boehm – the mosaic floor, the vertiginous copper and wrought-iron chandelier, and the central pool. William de Morgan designed the new tilework, Walter Crane the mosaic frieze, and Randolph Caldecott the gilt capitals of the alabaster pillars. The result was a harmonious yet highly romantic and dramatic expression of exotic taste; to contemporaries it “conjured up recollections of the finest scenes and grandest palaces described in the Arabian Nights”.

Many details of the interior of Leighton House were clearly determined by its owner – it was Leighton, for example, who designed the stencilled decoration on the marble chimneypiece in the drawing room – and the extent to which the building should be viewed as a collaboration between architect and client is still not clear. Nevertheless, the commission as a whole, and in particular the Arab Hall, did much to enhance Aitchison's reputation as a master of decoration and ornament. Moreover, his friendship with Leighton brought him into contact with a new circle of rich, fashionable clients and the two worked together on several subsequent interior schemes. These included a commission for the Eustace Smiths at 52 Princes Gate where Aitchison decorated the boudoir in rose and ivory, and the dining room in pale green, adding a heavy Renaissance-style chimneypiece and overmantle incorporating a Leighton frieze. They collaborated again in 1869 on the decoration of the interior of 44 Belgrave Square, owned by Percy Wyndham, one of the fashionable “Souls” group, who later engaged Philip Webb to build his country house Clouds. The staircase and inner hall of Belgrave Square were decorated in blue and Pompeian red stencilling, and a group of dancing classical figures (painted by Leighton) and a frieze of painted cormorants, storks and other flying birds was placed high up on the stairs.

This collaboration with artists established a pattern that Aitchison was to repeat in later commissions, several of which include friezes or panels painted by prominent painters of the Aesthetic school. In Frederick Lehmann's house at 15 Berkeley Square, for example, the drawing room included a panelled ceiling decorated with gold patterns on the beams, and pale pink walls that appeared below a frieze of peacocks executed by Albert Moore; in Miss Lehmann's dressing room Henry Smallfield painted groups of birds in flight on the doors. Again, when Aitchison took over the decoration of 1 South Audley Street from Frederick Pepys Cockerell in 1882, Walter Crane was called in to design the plaster reliefs on the stairs and the mosaic panels in the upstairs reception room, while the adjoining anteroom was decorated with a frieze of stylised plants and birds painted by W.E.F. Britten.

Unfortunately few of Aitchison's interiors survive, but much of the detail, as well as the overall design of his decorations, is illustrated in the collection of watercolour plans and elevations now housed in the Royal Institute of British Architects. These

watercolours show rooms suffused in colours that reflect the delicate palette of the Aesthetic Movement, walls covered in intricately patterned foliate ornament, architectural features picked out in black and gold, and pictorial panels depicting animals, putti or birds. On several occasions Aitchison also designed furniture. Old photographs of Leighton House show a pair of dark wood pedimented bookcases in the studio and a massive angular ebonised fitted sideboard in the dining room, and records in the Gillows Archive indicate that several of Aitchison's designs were made up by this firm. As in every other area of his work, the dominant features of his furniture were sumptuousness and complexity, qualities that are admirably borne out in the comments contained in a lecture of 1895 when he declared: "The ground of the cornices will shine with eternal colours, the piers will be enriched with sparkling panels, and friezes of gold will run the length of our buildings ... This will not be false and paltry luxury; it will be opulence, it will be sincerity" (Richardson, 1980).

JOANNA BANHAM

Biography

Born in London, 7 November 1825, the son of George Aitchison (1792–1861), City architect. Articled to his father; trained at the Royal Academy Schools, London, 1847; graduated from the University of London, 1851; travelled in France and Italy, 1853–55. In partnership with his father from 1859; succeeded him as architect to St. Katherine's Dock Co., 1862; in private practice from 1864. Fellow of the Royal Institute of British Architects, 1862; Vice-President, 1889–93; President, 1896–99; Royal Gold Medalist, 1898. Associate of the Royal Academy, 1881; Professor of Architecture, 1887–1905; Member, 1898. A member of many foreign academies, he also wrote and lectured on architecture and decoration. Died in London, 16 May 1910.

Selected Works

A full list of Aitchison's architectural works appears in his obituary in *The Builder*, 21 May 1910, p.592. An important collection of his designs for decorations and furniture is in the Drawings Collection, Royal Institute of British Architects; additional drawings are in the Victoria and Albert Museum, London.

Interiors

- 1866–95 Leighton House, Holland Park Road, London (building, interiors and some furniture; Arab Hall, 1877–79): Frederic Leighton P.R.A.
- 1869 44 Belgrave Square, London (interiors, including the staircase and inner hall): Hon. Percy Wyndham
- 1872–75 15 Berkeley Square, London (interiors, including the green drawing room, drawing room, boudoir, dressing room, and furniture for the dining room): Frederick Lehmann M.P.
- c.1882 1 South Audley Street, London (interiors, including the staircase, drawing room and anteroom): J. Stewart Hodgson
- c.1886–95 29 Chesham Place, London (interiors, including the drawing room, music room and conservatory): Sir Sydney Waterlow

Albertolli, Giocondo 1742–1839

Italian architect and designer of furniture

Giocondo Albertolli played an important role in the success of Neo-Classicism in Lombardy through his activities both as an architect and as a teacher. Etchings of his drawings were published during his lifetime and were dispersed all over Italy.

He was born at Bedano in Ticino. From 1753 he trained at the Accademia in Parma, and came under the influence of the ducal architect, the Frenchman E.-A. Petitot. Subsequently he worked at the Villa Poggio Imperiale in Florence, in 1770, and after a second stay in Parma, lived in Rome and Naples, where he studied the antique. He worked at the Royal Palace in Milan in 1774. From 1774–75 he returned to Florence, where he worked on plaster ceilings for the Uffizi and the Pitti Palace.

He settled in Milan in 1775, where as professor of ornament until 1812 he had a close association with the newly established Milan Academy of Fine Arts at the Brera. He also practised as an architect and interior designer; his commissions including the interiors of the Royal Palace, where he began an important collaboration with Piermarini, one of the most influential contemporary architects. With the help of 30 assistants, he was engaged for over two years on his first commission at the palace, the magnificent interior of the central saloon, the Sala dei Cariatidi (1776). He also worked on other interiors in the palace and at the royal villa at Monza (1777–80).

Albertolli managed to combine a refined decorative vocabulary, derived from Antiquity and Renaissance classicism, with contemporary trends in European decorative arts. His decorative schemes are richly embellished with antique leaves, vine-tendrils, volutes, roundels, lozenges, candelabra, sphinxes, eagles and trophies, without a hint of the bizarre or the capri-

cious. His ability to modulate rigorous symmetries enabled him to use refined stucco arabesques of great elegance and grace. These were highlighted with contrasting colours, such as delicate white on pale greens and gold and ivory on light blue, and in order not to compete with the architectural structure, their relief was barely perceptible.

Most of his work has been damaged or destroyed, either through bombing or demolition. However, his ideas on decoration can be studied through his many publications. These include imposing and refined Neo-Classical designs for furniture, metalwork and interior decoration. In his introduction to *Alcune decorazioni di nobili sale ed altri ornamenti* (1787), Albertolli declared the educational aims of his books, stating his hope that young students would not merely copy what they saw on the walls of the antique Roman baths, or at Herculaneum, for they may also have been painted by "second-rate painters", but that their source of inspiration should be great Roman architecture ("Roman architecture should be looked at, not painting"). These ideas closely linked Albertolli with G.B. Piranesi, though he made Piranesi's grandeur and emphasis more accessible by designing furniture which could blend with contemporary life and tastes. His furniture designs also differed from contemporary European fashions, and through their "severe, but graceful archaeological taste" they anticipate the developments in European furniture whose style emphasised the philological approach towards archaeological correctness (González-Palacios, 1986).

Among the most interesting plates in *Alcune decorazioni* is number VI, which depicts a stool shaped as a tripod, inspired by antique prototypes. The supports are not as naturalistic as their Roman model, for acanthus leaves are placed on the "knees" of the legs, which end in hooved feet, but the new element in Albertolli's design is the garland of oak leaves binding them together. The design was copied in carved wood, gilded to resemble gilt-bronze. It represents one of his few surviving documented pieces of furniture and, though restored, the stool is preserved in the Galleria d'Arte Moderna in Milan. Another surviving piece is the *faldistorium* / throne for Archbishop Filippo Maria Visconti. On the same plate in the *Alcune decorazioni* is a design for a sofa that resembles some of the prop-furniture used by Jacques-Louis David in his studio and which can be seen in his paintings.

Although the actual designer of the set of furniture decorating the salons at the Royal Palace in Milan is as yet unidentified, the furniture itself clearly reflects the influence of Albertolli's style. The sofa and chairs are decorated with carved and gilded rosettes, and this type of delicate, yet crisp low-relief carving, which is gilded against a light ground, is originally French. Though common in Piedmont it is seldom found in Lombardy, and Albertolli was the one of the few designers who used it in his furniture. Neo-Classical furniture in Lombardy more commonly included inlay / intarsia, a craft revived by Maggiolini. Albertolli and other designers, including Appiani and Levati, supplied designs for Maggiolini's marquetry panels, and Albertolli's complex compositions often included architecture, figures and delicate landscapes.

From 1808 to 1815 Albertolli designed the Villa Melzi, which is considered "one of the most significant [examples] of neo-classical architecture" (Ottino della Chiesa, 1959). He also designed its interior decoration and furniture, and in one

of the villa's rooms is a *trompe-l'oeil* decoration simulating stucco reliefs of Roman trophies and armour and helmets which is closely connected to the decoration of the Royal Palace in Milan and relates to plate XIV of *Ornamenti diversi* (1782).

Albertolli's designs were both highly inventive and extremely influential. They suggested a new direction for interior schemes, and together with the wealth of ornamental motifs illustrated in his published works, they provided a rich source of inspiration for other architects and designers. And perhaps most importantly he represents an influential precursor of later Italian Neo-Classical designers such as Pelagio Palagi.

MARIELLA PALAZZOLO

Biography

Born in Bedano in Ticino, 24 July 1742, the son of Francesco Saverio. Moved to Aosta, 1752, then to Parma to study with his uncle, a sculptor, and at the Academy, under Giuseppe Peroni, 1753. Came into contact with E.-A. Petitot, the ducal architect, with whom he collaborated on a triumphal arch. Began working independently, 1765. Won prizes at the Academy, 1766 and 1768. Married in 1768. Worked in Milan on ecclesiastical and domestic decoration, together with Gerli, and got to know Piermarini, 1769; worked at Poggio Imperiale, Florence, 1770 and on church decoration in Parma, 1772. Visited Rome and Naples, where he worked with Carlo Vanvitelli on church of SS. Annunziata, 1772; in Florence, 1774-75. Professor of ornament at Milan Academy of Fine Arts, 1776-1812. Worked on the royal palaces in Milan, Monza, and Mantua, 1774-80, and on many private Milanese palaces and villas, 1808-15. Designed a monument to Napoleon, 1808-09. Published several books of ornament, 1782-1805. Died 15 November 1839.

Selected Works

The Archivio di Stato, Milan contains much documentary material relating to Albertolli.

Interiors

- 1769-70 Palazzo Grillo, Milan (building and interiors)
- 1770 Poggio Imperiale, Florence (stucco ceiling decoration): Leopold I of Lorraine
- 1774 Royal Palace, Milan (decorations in the Salone)
- 1774-75 Uffizi, Florence (ceilings of Sala della Niobe): Leopold I of Lorraine
- 1774-75 Pitti Palace, Florence (ceilings in Sala degli Stucchi, Appartamento della Meridiana): Leopold I of Lorraine
- 1775-79 Royal Villa, Monza (Throne Room)
- 1776 Royal Palace, Milan (Sala dei Cariatidi)
- 1808-15 Villa Melzi, Bellagio (building and interiors): Melzi family
- c.1833 Villa Andreani, Moncucco (building and remodelling of chapel): Andreani family

Albini, Franco 1905–1977

Italian architect and designer

Franco Albini was an Italian architect, active before and after World War II, as much recognised for his work on interior displays and museum installations as for his buildings. He was born in 1905 in the countryside north of Milan into a well-to-do family and educated at the Politecnico in Milan where he graduated in 1929, serving his apprenticeship with Gio Ponti and Emilia Lancia, while at the same time making contacts with artisans and cabinet-makers which impressed upon him the importance of the crafts and the ways in which they could be used. It was also during this period that he discovered Modernism. In 1930 he established his own architectural practice, his first important building being that for the Istituto Nazionale delle Assicurazioni in Milan in 1935. This building embodied a form of design that was to remain with him all his working life. It incorporated something of the language of Mies van der Rohe and the Bauhaus, but tempered by the idea of an Italian tradition of design which encouraged him to move beyond the stricter limits favored by the Rationalist movement in Italy.

Albini's work was noted in the Milan Triennales of 1933 and 1936, and it was in 1936 that he designed the *Appartamenti Minetti*, Milan, and, with Renato Camus and Giancarlo Palanti, the much praised *Fabio Filzi Workers Housing Estate* in the Viale Argonne, Milan. The *Fabio Filzi* project won the Silver Medal in the Paris International Exhibition of 1937. It revealed his style to be in direct opposition to that enunciated in the journal *Architettura*, the magazine of the Fascist Syndicate of Architects and the Neo-Classical architect Marcello Piacentini, which controlled and dominated Italian architecture during the pre-war years.

The war led to a decline in Albini's commissions, but by the early 1950s he was once again fully employed, most notably in the *Albergo Pirovano*, Cervinia (1949–50) which looked back to Gropius and the Sommerfeld House, and the building for the Istituto Nazionale delle Assicurazioni, Parma (1950), recognised immediately to be one of the first significant post-war buildings in Italy. It was at this time also that Albini produced one of his most important interior designs, for the *Municipal Galleries* at the *Palazzo Bianco*, Genoa (1950–51). Here, he introduced to museum design the idea of simple walls and a kind of rationality which, according to the curator of the museum, would allow the works presented to be seen aesthet-

ically and without what was termed sentimentality, that is to say false historical detailing; all the fittings were designed to take up the least space. In some ways this approach to the design of interior spaces looked back to a plan that Albini had envisaged for a design at the Brera in 1941. But at Genoa he established a model that all later museum designers in Italy, such as Carlo Scarpa, BPR, and others, would follow.

Albini worked on the restoration of the *Palazzo Rosso*, Genoa (1952–61) with his partner, Franca Helg, who joined him in 1952, and it was with Helg that he designed his most famous building, the *Rinascente Department Store*, Rome (1957–61). The design for this commission went through many stages, but in its final form the plan of the building was determined by a simple steel frame, the elements of this frame being emphasised, as critics noted, so that they look almost like the timbers of an old Japanese temple. Around and amidst this structure are set exposed, pre-cast, mostly windowless walls, that carried within them the service elements – air-conditioning and the like – all ending at the appropriate floors and defining from the inside out the size of each external unit. The result was a pattern of forms that enlivens the otherwise simple, even dull profile, the variations being accentuated further by the shadows of the spandrels above, and by the thin horizontal white bands placed at head height on each floor. As Helg declared, *La Rinascente* was an investigation into new construction techniques; it was also, according to the critic Paolo Portoghesi, a powerful argument against vulgarity and approximation that all designers should follow.

Albini continued to work on the problems of interior design, most notably in the designs executed in 1962–63 for the Milan metro system, and in the remodelling of the *Civic Museum of Padua* (1969–89), and *Museo Sant'Agostino*, Genoa (1963–69 and 1977–86). He was also responsible for a range of interesting and influential furniture designs. These began in 1932 with some lacquered wood furniture designed for the *Dassi Company* that were exhibited at the *Milan Trade Fair*. Far more radical, however, were the suspension bookshelves shown at the *Milan Triennale* in 1940. The structure of these shelves, employing carefully shaped, complex members of wood and brass, and steel cables both for suspending the shelves and acting as stays to the wooden members, recalled not only the structure of suspension bridges but also of ship architecture. They were quite unlike the usual kind of book storage and served as both shelves and room-dividers, a design feature that became increasingly popular in interiors of the 1950s and 1960s. Albini's designs for wicker chairs of the 1950s, and his *Tre Pezzi* tubular steel chair, show him to have also been working in popular contemporary materials. In the 1960s he branched out into lighting design executing a series of innovative designs for the Italian firms *Arteluce* (1960–62) and *Sirrah* (1968–71). His last major design commission, never realised, was for an *Urban Design Center* *Kasar-El Hokm*, Riyadh, Saudi Arabia (1976) which drew on ideas of civic planning which he had been concerned with from the 1930s.

Albini did not propose or refine a particular architectural theory, but he influenced a large number of Italian designers and architects through his practice and his teaching. From 1945 to 1948 he edited the journal *Casabella*, newly revived after the demise of Fascism; from 1949 to 1964 he was Professor of Architecture in Venice, and from 1964 to 1977 he

Albini: living room of Albini apartment, Milan, 1938–40

was Professor of Architectural Design at his old school, the Politecnico, Milan. From 1968 to 1969 he was also a member of the progressive Congrès Internationaux d'Architecture Moderne (CIAM).

His concern with accommodating the best of the long architectural traditions of Italy with the present social and political realities attracted a significant following and he was always able to gather around him a group of designers sympathetic to his way of working. In formal terms, perhaps, there is no distinctive Albini style, and his designs vary from one to another. But in all his work he tried to emphasise an idea of rationality, marked always with what has been termed the phenomenology of materials. Albini was much influenced in this by Adolf Loos; younger Italian designers like Gino Serfatti and Paolo Rizzato have willingly acknowledged Albini's influence on them.

DAVID CAST

Biography

Born in Robbiate, near Como, 17 October 1905. Studied architecture at the Politecnico, Milan, and graduated, 1929. Married: son, architect Marco Albini (b.1940). Apprenticed in the studio of Gio Ponti (1891–1979). In private practice as an architect and designer in Milan from 1930; in partnership with Franca Helg (b.1920) from 1952; Antonio Piva from 1962; Marco Albini from 1965. Designs for furniture and exhibition layouts from late 1930s; museum conversions and interiors from 1950s. Editor of *Casabella*, 1945–48. Taught

at University Institute of Architecture, Venice, 1949–64; Professor of Architectural Design and Architectural Interiors from 1952. Lecturer, American-Italian Commission of Cultural Exchanges, Rome, 1954–63; Professor of Architectural Composition, Politecnico, Milan, 1964–77. Received numerous awards including Compasso d'Oro Award, Milan, 1955, 1958, 1964; Olivetti National Architecture Medal, Milan, 1957; Biscione d'Oro Award, Milan, 1971. Honorary Royal Designer for Industry, Royal Society of Arts, London, 1971; Honorary Fellow, American Institute of Architects; Member, Scientific Institute of the Italian National Research Centre of Museography. Died in Milan, 1 November 1977.

Selected Works

For a full list of Albini's architectural projects see Leet 1990.

Interiors

- 1935 Istituto Nazionale delle Assicurazioni, Milan (building and interiors)
- 1936 Fabio Filzi Workers Housing Estate, Viale Argonne, Milan (buildings and interiors; with Renato Camus and Giancarlo Palanti)
- 1936 *Dwelling Exhibition*, Milan Triennale ("Room for a Man" and "Apartment for Four" exhibition layouts)
- 1937–38 Villa Pesarini, Piazza Tripoli, Milan (building and interiors)
- 1938–40 Albini Apartment, Milan (interiors and furnishings)
- 1940 *Criteria for the Modern Home*, Milan Triennale ("Living Room for a Villa" exhibition layouts)
- 1950 Istituto Nazionale delle Assicurazioni, Parma (building and interiors)
- 1950–51 Palazzo Bianco, Genoa (renovation and remodelling of the interiors)
- 1952–56 Museum of the Treasury of San Lorenzo, Genoa (building and interiors)
- 1952–61 Palazzo Rosso, Genoa (museum conversion, with Franca Helg)
- 1953 *Italian Contemporary Art, Design and Architecture*, Stockholm and Helsinki (exhibition layouts)
- 1954 Palazzo Rosso, Genoa (Marcenaro apartment conversion and interiors)
- 1957–61 La Rinascente department store, Rome (building and interiors)
- 1962–63 Metro stations, Milan (interiors with Franca Helg, Antonio Piva and Bob Noorda)
- 1963–69 Sant' Agostino Museum, Genoa (restoration, additions and interiors, with Marco Albini, Franca Helg and Antonio Piva)
- 1977–86 Civic Museum, Padua (restoration and reorganization of Cloisters and New Painting Gallery; with Marco Albini, Franca Helg and Antonio Piva)

Albini designed numerous items of furniture from the 1930s. Notable examples include the *Tensistructure* suspension bookcases (1940), the *Margherita* and *Gala* wicker chairs (1950), the *Luisa* armchair (1954–55), and the *Tre Pezzi* tubular steel chair (1959). Albini's clients included La Rinascente, Carlo Poggi, Knoll International, Cassina, Arflex, Siemens, Fontana Arte and San Lorenzo. He also designed lighting for Sirrah from the late 1960s.

Allori, Alessandro 1535-1607

Italian painter and tapestry designer

Alessandro Allori was one of the most prolific and versatile Florentine artists of the second half of the 16th century. He was not only a successful painter of religious art and portraits, but also designed stage costumes, architectural decorations for baptisms, marriages and funerals, and cartoons for tapestries and embroidery. In addition he studied anatomy and wrote prose and poetry. As official artist to the Medici court, his work was both highly visible and extremely influential, and fusing Italian and Northern traditions, he played an important role in the dissemination of Mannerism in Italy.

After his father's death in 1540, Allori was brought up by the painter Agnolo Bronzino (1503-72), who also trained him. Allori designed many of the borders for the twenty tapestries depicting the *Stories of Joseph* made for the Sala dei Dugento in the Palazzo Vecchio in Florence (1549-53) while he was working in Bronzino's workshop. His skill in representing nature and in the use of an ornamental vocabulary which included masks and term-figures is already apparent in these designs.

Another important element in Allori's work derived from his interest in Flemish art which was nurtured by the presence at the Medici court of Northern artists, including Jan van der Straet (Joannes Stradanus) (1523-1605). The influence of Northern painting is found not only in the use of naturalistic elements, such as aquatic fauna and the presence of landscapes in his work, but also in Allori's approach to subject matter. Like many Netherlandish painters, he often included anecdotal and genre details illustrating characters or objects from everyday life; these encouraged the spectator to identify with the scene depicted.

Allori's stay in Rome from 1554 to 1559 completed his artistic education and, together with his Florentine training, it encouraged his reliance on drawing and anatomy. This is revealed in many of his tapestries on sacred and mythological themes where the influence of Northern art is combined with an elegant and refined treatment of figures which appear to be inspired directly by the Florentine nobility.

In 1565 Allori became a member of the Florentine Accademia del Disegno, and around the same date began an enormously prolific career – mainly in the service of the Medici court – which included grotesque painted decoration and designs for tapestries. In the same year he completed one of his most important early commissions, that for 132 costume designs for characters in the *Genealogy of the Gods*, performed on the occasion of the marriage of Francesco I de' Medici and Johanna of Austria. These designs became the source for all his future work. The design for *Truth*, for instance, recalls the "terms" which Allori designed for the borders of the *Story of Joseph* tapestries and for some of his frescoes. Many of his figures resemble those designed by Vasari but they have an added liveliness and are clothed in charming, if somewhat bizarre, highly decorated and detailed costumes. Versions of these figures can be seen in Allori's frescoes for the Medici villa at Poggio a Caiano (1576); a Roman consul and the vivacious Ambassador seated before him are closely connected with a series of his mythological drawings.

Allori also designed a set of tapestries on the theme of the *Hunting of Aquatic Birds* (1576), another important commission for the Poggio a Caiano villa. The set was woven by Benedetto Squilli by 1578. These tapestries have often been unfavourably compared with those by Stradano, but in Allori's work the realism and action of Stradano's designs have been transformed into subtle and refined stories in which noblemen and their entourages are depicted in romantic landscapes brought vividly to life by a profusion of plants and animals. One interesting topical detail is the reference to an exotic landscape suggested by the depiction of figures wearing loincloths made of fig-leaves, working in a pumpkin field. This landscape was inspired by accounts of the West Indies by Gonzalo Fernandez de Oviedo which were well known at the Medici court.

From 1578 Allori was engaged in the design of tapestries depicting Ovid's *Metamorphoses*. The design of these tapestries echoed that of historical frescoes; the main characters were placed in the centre of the composition with the lesser players arranged on either side. The figures themselves have a strong sculptural quality which is combined with graceful garments that are enriched with gold embroidery and diamond buckles. In the *Payment of the Soldiers* Allori sets the characters on different levels parallel to the picture plane. The composition is harmoniously built up using *figures repoussoires* (proscenium figures), and armour is scattered about on the ground like trophies to form a decorative pattern linking the centre to the borders. Allori's designs also took into account demands of weaving; these, and the religious tapestries of the same period, show a remarkable maturity and skill.

In addition to his tapestry designs, Allori executed painted grotesque work at the Uffizi in 1581, and was also active in the service of other Florentine patrons. He designed grotesques and frescoes for a new suite of rooms and for the chapel in Jacopo Salviati's Florentine palace between 1575 and 1580. But it is as a tapestry designer that he is now known. He never abandoned the Florentine tradition of drawing, derived especially from the Mannerist style of Vasari, even though this did not always suit the decorative function and style of the tapestry. And he was at his most successful when he was able to

combine his own Italian cultural legacy with the love of detail and the decorative elements he drew from Northern art.

MARIELLA PALAZZOLO

Biography

Born in Florence, 1535. First apprenticed to the painter Agnolo Bronzino (1503–72). In Rome, 1554–59. Met Jan van der Straet (Giovanni Stradano, 1523–1605), a Flemish artist in Medici service, forming a long association in the provision of designs for tapestries. Member, Accademia del Disegno, 1565, and collaborated on the decorations for the marriage of Francesco I de' Medici and Johanna of Austria, 1565. Active in service of Medici family from c.1576–98, as designer and painter. Also worked for other Florentine noble families, and as portraitist and religious painter. Died in Florence, 1607.

Selected Works

Many of Allori's designs and drawings are held in the Uffizi Gallery, Florence. Most of his tapestries are held in deposit at the Palazzo Vecchio, Florence.

- 1549–53 Border designs for tapestries for Sala dei Dugento, Palazzo Vecchio, Florence: Grand Duke Cosimo I de' Medici
- 1564 Designs for the catafalque for Michelangelo's funeral in Florence: Medici family
- 1575–80 Palazzo Salviati, Florence (grotesques and frescoes for suite of rooms and chapel): Jacopo Salviati
- 1576 Villa Medici, Poggio a Caiano (suite of tapestries): Grand Duke Francesco de' Medici
- 1581 Uffizi, Florence (grotesque decorations for interiors): Grand Duke Francesco I de' Medici
- 1583–1607 Cartoons for four tapestries on bull fighting: Grand Duke Francesco I de' Medici
- 1594 Salone del Cinquecento in Palazzo Vecchio (tapestries): Grand Duke Ferdinando I de' Medici
- 1613–17 Tapestries with pastoral scenes woven after his designs: Medici family

Amsterdam School

The name "Amsterdam School" is used in architectural history to denote Dutch Expressionist architecture between 1920 and 1930. This architecture is characterised by a very individual search for form, an intuitive, non-theoretical approach to the design brief and an expressive architectural vocabulary.

The Amsterdam School label, first launched by Jan Gratama in an exhibition catalogue in 1915, is not entirely accurate. The movement centred on Amsterdam, but there was no question of a school in a literal sense. The common bond was mutual friendship and artistic affinity. Most of the leading architects in the movement worked in the Amsterdam office of Eduard Cuypers (1859–1927) at the outset of their careers and knew each other from there. J. van der Mey, P.L. Kramer, Michel de Klerk, G.F. de la Croix and a number of others began there as draughtsmen. Cuypers's practice was international in outlook and allowed its staff considerable freedom. This enabled the up-and-coming architects in the office to familiarise themselves with "English free architecture" and with developments in Darmstadt, Munich and Vienna. Interest in the folk and other art of the Dutch East Indies was also encouraged by Cuypers, partly through his commissions there.

This training at the turn of the century was of great importance to the architects of the Amsterdam School. Not only did they have free access to developments abroad, but they also became acquainted with the broad spectrum of design: architecture, furniture, stained glass and even metalworking. This craft-based introduction to the profession and the synthesising of various sources of inspiration ultimately led them to a plastic and decorative approach in their architecture and applied art. In contrast to Hendrik Berlage's logical rationalism, the Amsterdam School designers stressed the primacy of the notion of form, which subsequently determined the choice of construction and material. The artist's intuition and concept of form were decisive for the end result.

The architecture, interiors and applied art of these architects were part of an all-embracing concept. On the one hand the plastic form of house fronts, the abstract brick ornamentation, the sculpture (reliefs) and the use of wrought iron emphasised the individuality of the building, while on the other hand giving form and definition to the urban space. This latter concern also manifests itself in a similar interest in the design of urban furniture in Amsterdam, including public toilets, transformer stations and tram shelters, municipal giro post-boxes, and the detailing on bridges.

The expressive exterior was continued into the interior, with the decorative doors and windows, sometimes featuring stained glass, as the linking elements. The interior pendant to the plasticity of the house front is the panelling, which sometimes extends up from the walls to cover the ceiling, thus creat-

ing a spatial unity. Apart from its practical function the furniture serves the same role in spatial terms – each item has a clear plastic volume and presence. The parallel to the brick ornamentation and the reliefs of the exterior can be found in the detailing of the panelling and the furniture, in the use of various types of wood, veneer and fabric. Wrought metal also returns in the interior, no longer as neutral abstract decoration, but in the shape of hanging lamps and cupboard fittings. The formal elements used (trapezoids and parabolas) and the ornamentation are therefore generally co-ordinated and are repeated in various interior components.

At that time the main emphasis in interior design was on intimate domesticity. The windows must not be too big, and the curtains, and sometimes stained glass, subdued the light. If one was to achieve pleasing spatial proportions, the ceiling must not be too high – in older houses people were advised to lower the ceiling. The panelling and the spatially assertive furniture, together with the dark colour of the floor and wall-paper, resulted in a subdued atmosphere.

These characteristics of Amsterdam School interiors apply mostly to those designed as ensembles, as in the Scheepvaarthuis in Amsterdam (de Klerk, Kramer and others, 1913–16) or the Tuschinsky theatre there (Jaap Gidding, 1918–21). In the case of residential housing the nature of the design depended on the financial resources of the client. In the social housing projects in Amsterdam, for which the Amsterdam School has become best known, the window and door shapes were dispensed with, and there was scarcely any unity of interior and exterior. The furniture was far too expensive for working people, and, apart from that, too large for these homes. The leading designers had little or no interest in mass production. Commercial designs were produced in small runs of hand-made, labour-intensive and hence expensive furniture. The all-embracing concept of architecture and interiors was obviously incompatible with mass production and the freedom of choice it offered in constructing interiors.

Of the group of designers in the Amsterdam School, the architects de Klerk and Kramer were regarded as leading figures from an early date. Michel de Klerk (1884–1923), the most talented architect in the group, made his first sketches of furniture in 1910–11 during his travels through Scandinavia. The furniture designs from his first period (1910–14) are eclectic in nature – the inspiration of robust rustic furniture from the Skansen open-air museum in Stockholm combines with elements of Neo-Classical Biedermeier and motifs from the work of Mackintosh. The interior for J.H. Polenaar in The Hague (1913–14) or the boardroom of the Royal Netherlands Packetboat Company in the Scheepvaarthuis in Amsterdam (1912–14) can serve as examples.

The most characteristic furniture and interior designs by de Klerk were produced between 1915 and 1920, mainly in association with the interior design company 't Woonhuys in Amsterdam. De Klerk designed some 75 models, 50 of them in limited editions. These include several ensembles, such as bedroom designs or study suites. All the individual items of furniture, with their extravagant forms, make an emphatic statement in the interior: for example, the seats of the chairs are never square, but semi-circular, oval, triangular or polygonal. Their backs sometimes have the form of an exaggeratedly elongated triangle or oval and in the detailing they are remi-

niscient of a backbone, like some of Mackintosh's chairs. The stress-carrying function of the chair legs is disguised by all kinds of combinations of horizontal cross members and sledge-shaped feet. The cupboards and beds are massive, often parabolic or trapezoid, with rounded corners. These pieces of furniture were unusual not only in their basic shape, but also in the detailing, with additions such as claws, teeth or serrated points, which sometimes gave them an aggressive quality. The furniture was mostly made of pine covered with plywood and tropical veneers. The furniture designs from 1920 and after are somewhat more restrained in their form, with fewer decorative embellishments.

The furniture and interior designs of Pieter Lodewijk Kramer (1881–1961) were more plastic and compact in form than de Klerk's, and created with a greater eye for proportion. The detailing derives from the basic shape and is not added on. Kramer designed furniture from 1914 onwards, mostly for private clients, in association with various companies, the most important of which was the firm of Nussink en Zoon. Kramer's furniture designs were awarded a Grand Prix at the 1925 Exposition des Arts Décoratifs in Paris, which is an indication of the affinity between the later designs of the Amsterdam School and Art Deco. Kramer's most famous interior, which was unfortunately subsequently remodelled, is the Bijenkorf department store in The Hague (1924–26).

The interior work of the sculptor Hildebrand Lucien Krop (1884–1970) is scarcely distinguishable from that of Kramer. Krop too was aiming for plasticity in his furniture designs, and his training as a sculptor played a prominent part. This is mainly noticeable in the detailing: Krop himself carved the plastic ornaments. Krop also worked in association with the firm of Nussink en Zoon. He is best known for his sculptural embellishment of the Amsterdam bridges designed by Kramer.

The work of other designers of the Amsterdam School moved between linear decoration and a more plastic style, like that of Dirk Greiner (1891–1932) or Piet Vorking (1878–1960). The influence of de Klerk was sometimes visible, for example in the work of Jan A. Snellebrand (1891–1963) and Adolf Ebbink (1893–1975). The Tuschinsky cinema in Amsterdam (1918–21) by Jaap Gidding (1887–1960) represents a mixture of the Expressionism of the Amsterdam School and Art Deco. After 1925 the flow of new ideas from the Amsterdam School dried up and gave way to a more functional view of interior design.

OTAKAR MAČEL
translated by Paul Vincent

Selected Collections

Examples of furniture by designers associated with the Amsterdam School are in the Rijksmuseum, and the Stedelijk Museums, Amsterdam; the Museum Boymans-Van Beuningen, Rotterdam; and the Gemeentemuseum, The Hague. A large collection of drawings by de Klerk is in the Netherlands Institute of Architecture, Rotterdam.

Antiquarianism

Antiquarianism is the study of antiquities. In the context of interior design, it refers to the collection and display of ancient objects, assembled from different periods, countries, and stylistic traditions and generally valued by the collector, or antiquary, more for age and historical significance than for aesthetic merit. The interior effect is an eclectic mix of objects and histories which exalt the past. The compelling stylistic impression of such an interior, which can indeed vary from room to room in an antiquarian house, might be of Britain in the Middle Ages, or of France at the time of Louis XIV, or of the Islamic Middle East, or even of ancient Greece or Asia. The distinguishing characteristics of an Antiquarian interior are: first, the use of ancient objects; second, the representation of a gamut of periods and styles; and third, the antiquary's individual intentions. Antiquarianism is characterized partly by objects amassed, and partly by the motives of those creating the interiors.

As vehicles of historical and personal reminiscence and monuments of idiosyncratic individuals, Antiquarian interiors remain outside the classification system for interior styles. Born as a reaction against the uniformity of contemporary interior styles, such as the despotic Rococo and Neo-Classical movements which were fully realized in France, Antiquarianism represented a search for a more personal, informal living experience. It developed concurrently with the Picturesque movement which admired the irregularity, drama, and variety of nature. The focus was pictorial and associational, as opposed to structural and archaeologically-correct as became the emphasis of the mature Gothic Revival of A.W.N. Pugin and the Ecclesiologists.

Antiquarianism was essentially the secularization of the great medieval church treasuries on the Continent, such as that of the Abbey of St. Denis, which remained intact until the 18th century. A more immediate precedent was the meticulously-catalogued secular collections, inclusive of man-made and

natural items, of the 17th century. These included the Duke of Brandenburg's collection in Berlin, the Tradescant collection and the Earl of Arundel's specialized collection of classical and Renaissance antiquities in Britain, and museums on the Continent such as that of Dane Ole Worm and Italian museums – Ferrante Imperato, Museum Calceolarianum, and Museum Cospiiano. Despite the continental precedents, Antiquarianism, like the Gothic Revival, evolved later on the Continent than in Britain. This is partly because of political and social unrest in France, specifically the French Revolution and the Napoleonic Wars.

The central figure in the creation of Antiquarian interiors during the 18th and 19th centuries was the patron – the antiquary. Since the 17th century, the terms *antiquary* and *antiquarian* had been associated with medieval objects and eccentric tastes, whereas *virtuoso* and *connoisseur* referred to genteel collectors of classical antiquities. The antiquary's work was time-consuming, dependent upon the slow assemblage of objects and decorative elements and the extended employment of numerous architects, upholsterers, designers, and antique brokers. Although each Antiquarian interior reflected the particular taste of its patron, there were furnishings common to all. Ancient carved woodwork and stone fragments, retrieved from demolished cathedrals, castles, and monasteries, were used in the creation of rooms and furniture. Windows featured stained glass, either antique plundered from medieval manors and churches or modern with heraldic references and an ancient appearance. A collection of armour was essential to any antiquarian house, as was medieval or Renaissance seating furniture. Most popular were triangular and ebony turned chairs, which, like the stained glass, could be rare antiques or modern renditions.

One of the first and greatest Antiquarian interiors of the 18th century was Horace Walpole's Strawberry Hill (1747–96). Every room was stuffed with objects: some of great historical interest such as Cardinal Wolsey's hat, a silver-gilt clock that was given to Anne Boleyn by Henry VIII, and an ancient oak chair from Glastonbury Abbey; some of aesthetic significance such as a French Limoges enamel casket, c. 1540, and a Neo-Classical cabinet for miniatures; and some of innovative contemporary design like chairs designed by Walpole and Richard Bentley that introduced Gothic window tracery as a design source. The effect was a haunting Gothic-inspired work of architecture filled with educational relics. Strawberry Hill drew many visitors and in 1784 Walpole published an illustrated guide, *A Description of the Villa of Mr Horace Walpole Youngest son of Sir Robert Walpole Earl of Orford at Strawberry Hill near Twickenham Middlesex with an inventory of Furniture, Pictures, Curiosities &c.*

Exceptional Antiquarian interiors were beginning to appear in France during the last decades of the 18th century. Alexandre Lenoir opened his Musée des Monuments Français to the public in 1791. Alexandre Du Sommerard (1779–1842), one of the premier French collectors of medieval antiquities, created a series of Antiquarian interiors with a mystique rivaling Walpole's. Initially established in the rue de Menars, Sommerard moved to the rambling medieval Hôtel de Cluny in 1832. Here he opened his ever-expanding collection to the public, and for the next ten years it was one of Paris's great attractions and a focus for Romantic artists and antiquarians.

Antiquarianism: Alexandre Du Sommerard in his study, from *Les Arts du Moyen Age*, 1838–46

Celebrated antiquarians who assembled inspirational Antiquarian interiors in the 19th century include: rapacious collector and creator of Fonthill Abbey William Beckford (1760–1844); Romantic novelist and poet Sir Walter Scott (1771–1832); and arms and armour expert Sir Samuel Rush Meyrick (1783–1848). Publications, fiction and nonfiction, from Sir Walter Scott's *The Antiquary* (1816) to Henry Shaw's *Specimens of Ancient Furniture* (1836) and J.N.L. Durand's *Recueil et parallèle des Edifices de tout genre, anciens et modernes, remarquables par leur beauté, par leur grandeur ou par leur singularité, et dessinés sur une même échelle* (1800), coupled with increased nationalism across Europe, fueled a more universal interest in Antiquarian interiors and ancient regional styles.

The work of both Henry Shaw (1800–1873) and Thomas Willement (1786–1871) profoundly affected the movement's development during the early 19th century. In publishing *Specimens*, Shaw made available for the first time accurate

graphic representations of still-existent ancient furniture pieces. In the late 1830s, Willement pioneered both the design of Gothic-inspired heraldic stained glass and encaustic tiles, and that of Elizabethan-styled wallpapers, best exemplified in his work to rehabilitate Charlecote Park (1830–39). The effect was ancient in mood and inspiration, but modern and convenient in living.

More than simple imitation of historical styles or the superficial incorporation of ornament, antiquaries sought to establish a sense of history. However, by the mid-19th century Antiquarian interiors lost many of their erudite associations and became more popularized. A bustling antiques trade flooded the market with objects of dubious provenance and age while an ever-increasing number of cabinet-makers specialized in modern versions of antique styles. Increasingly, Antiquarian interiors came to resemble “Old Curiosity Shops,” as opposed to dens of historical instruction and ancient mood. And while the collections amassed by patrons

such as Beckford and Walpole had prefigured a more widespread romantic interest in the Middle Ages, the archaeologically-correct approach of medieval scholars such as Pugin sounded its death-knell.

The legacy of Antiquarianism rests on the one hand with the practice, that continues today, of furnishing a home with antiques and bric-a-brac. On the other hand, Antiquarianism foreshadowed elements of the Arts and Crafts Movement: William Morris, for example, shared antiquarians' passion for history and objects with tangible signs of age, albeit to a more rustic end. Finally, Antiquarianism of the 18th and 19th centuries also served as a precedent and foundation for many of today's major museums. Sir Samuel Rush Meyrick's *Goodrich Court* (1829–35), representing interior styles from the Middle Ages to contemporary France, is the forebear of museums containing period rooms.

Antiques Movement

Before the middle of the 19th century, collecting was practised mainly by wealthy antiquarians and connoisseurs and was restricted to the rare and ancient. Men such as Horace Walpole

at Strawberry Hill and Sir Walter Scott at Abbotsford purchased antiquities and architectural fragments from shops and auctions throughout Europe, or acquired them as presents from friends on their travels. Provenance was of great importance to these collectors who preferred to buy directly from private sources rather than from dealers whose practice it was to "improve" old furniture. Brokers in curiosities, or "nick-nacktarians" as they were also known, provided another source of exotic artefacts for the romantic interior.

By the 1870s there was a new emphasis on the amateur collector and collecting was extended to more commonplace objects, "those excellent ordinary works of art" as Mrs. Orrinsmith described them in her popular publication, *The Drawing Room* (1877). The influence of the Queen Anne style, with its stress on informality, irregularity and asymmetrical arrangements, stimulated the demand for antiques. Faded fabrics and patina blended with muted colour schemes that were then in vogue. Collecting became a pleasurable pastime and the arrangement of pieces a creative activity, especially for women. The countless publications on the subject of home decorating and furnishing that appeared during this period all offered extensive advice on how to identify, purchase and use antiques.

The craze was current on both sides of the Atlantic. Clarence Cook declared in the well-known book, *Artistic Houses* (1883) that the interest in "old furniture" was "a fashion, that has been for twenty years working its way down from a circle of rich, cultivated people, to a wider circle of people who are educated, who have natural good taste, but who have not so much money as they could wish". The development of national consciousness that emerged around the time of the Philadelphia Centennial in 1876 provoked interest in past styles and indigenous antiques. Charles Allerton Coolidge, Francis H. Bacon, and Wilson Eyre were among those whose decorative work exhibited a respect for the Colonial and Federal eras.

Old furniture fulfilled a need to proclaim personal, social, and national affiliation. It suggested permanence in the home in opposition to the seemingly ever greater pace of change outside. Permanence additionally implied social status; old families had old things. Old furniture also had a romantic and emotional appeal, as H.J. Jennings in *Our Homes and How to Beautify Them* (1902) explained:

Fashions have changed, beliefs have broadened, intellectual revolutions have taken place; yet the old chairs and cabinets and commodes remain to remind us Vita brevis, Ars longa. What stories they might tell us could they but speak, what gossip of long-ago romances and intrigues, of jealous quarrels, of tipsy, hot-blooded revels ending in tragedy, of elopements to Gretna Green, of all-night carousals, of high and reckless gaming, of all the excitement and stress and turmoil of a life and society that have passed away!

Sources for old furniture were plentiful. J.H. Elder Duncan, in *The House Beautiful and Useful* (1907) recommended "the quaint little second-hand furniture shops in Wardour Street and elsewhere" as useful places to go, although he admitted that it was no longer as easy to find bargains as it had been twenty years before. The painter Dante Gabriel Rossetti was a

well-known customer of these shops and was one of the first people to start collecting the new antiques. He greatly admired English 18th century furniture for its simplicity and craftsmanship and according to Henry Teffry Dunn, his assistant, he “delighted to take an evening’s walk through Leicester Square, visiting the various curiosity shops in that neighbourhood, or through Hammersmith, a district where many a Chippendale chair or table could be met with and bought for next to nothing, such things not being then in the repute that they have become since the taste for Queen Anne houses and fittings sprang up”. What distinguished Rossetti’s interiors in his house on Cheyne Walk from the earlier Antiquarian ones was that there was no precise historical theme. Gothic preferences were now supplemented by a liking for later objects and there was no evocation of any one period, just a generally old atmosphere, using “all conceivable superannuated designs”.

The term “Antique Dealer” first appeared in London trade directories in 1886. By the turn of the century there were over 200 “Antique Dealers” listed for central London alone. In 1918 the British Antique Dealers’ Association was established. Most large retail shops like Waring and Gillow and Heal’s had antique departments. A great deal of publicity was given to this type of furniture. Articles were regularly published in both the trade press and in fashionable magazines.

Antiques were soon, however, in short supply. Ella Rodman Church, writing on the situation in America in *How to Furnish a Home* (1881), advised her readers to fill the many shelves of their artistic chimneypieces with bric-a-brac including “one’s own or someone else’s great-grandmother’s candlesticks”. If these were lacking, one was forced to visit “the Broadway bazaar, filled with antiques and supercilious clerks, with fabulous prices for the simplest articles”. In 1884 the American magazine *Cabinet-Making and Upholstery* told its readers that “there is little doubt but the manufacture of antiques has become a modern industry”. A massive trade in reproduction and period-style furniture flourished in both Britain and America until the middle of the 20th century.

The first serious book on furniture history in Britain, *An Illustrated History of Furniture* was published by a Wardour Street dealer, Frederick Litchfield, in 1892. The new kinds of books helped to assess authenticity; the new kind of dealer had to guarantee it. Early faking of old furniture, from the beginning of the 19th century onwards, consisted chiefly of making new pieces by reassembling old pieces of timber, or by carving plain old pieces. By the 1870s this practice was already ridiculed, as was the buying of “family portraits from Wardour Street”. Charles Locke Eastlake also condemned the application of thick varnish with the aim of making furniture look old. Indeed, so widespread was the production of fakes or articles of dubious provenance that J.H. Elder Duncan declared: “Beyond a few dozen pieces of furniture made for royal households or ennobled families, where their history is preserved or known, it is unsafe to proclaim a single article that comes into the market as the authentic work of any known master”.

An interest in antiques and period decoration was also fostered by the practice widespread in many late 19th century middle-class homes, of furnishing rooms in different styles according to prevailing fashions. This custom was equally, and perhaps not surprisingly, encouraged by the furniture trade, who produced vast catalogues of period styles promoting

different styles for different rooms. Halls were typically decorated in Renaissance (Italian / Flemish / French) styles, dining rooms in Early English (Elizabethan / Jacobean) styles, drawing rooms in English or French 18th century styles (Chippendale / Adams / Louis XV or XVI), and bathrooms in Pompeian style. While it was widely accepted that these different styles might be appropriate to different rooms in the house, the resulting eclecticism was nevertheless often deplored. Mrs. Panton, for instance, in *Suburban Residences and How to Circumvent Them* (1897) attacked “the jumble of styles made by having an eastern-looking hall, an Old English dining room, a Queen Anne drawing room, and Moorish landing, which is inexpressibly dear to the would-be artistic decorator”. And Jacob von Falke, whose *Art in the House* was published in Boston in 1879, observed in connection with the International Exhibition held in Vienna in 1873 that, “in so far as style is concerned the modern Frenchman dwells in the eighteenth century, he sleeps in that century likewise, but he dines in the sixteenth, then on occasion he smokes his cigar in the Orient, while he takes his bath in Pompeii, Rome”. But, despite criticisms of this kind, eclecticism remained fashionable in wealthy artistic circles until the middle of the 20th century.

The aristocracy were more likely to furnish in a more historically consistent manner, often to provide a setting for their collections of art and antiques. Baron Ferdinand de Rothschild’s massive English home, Waddesdon Manor in Berkshire, for example, was built in French Renaissance style but was furnished and decorated in French 18th century style so as to complement his family’s fine collection of works of art of that period. Many of the interiors were designed to incorporate elaborately carved Rococo *boiseries* taken from houses in France. Several fashionable society decorators in the 20th century, such as Elsie de Wolfe, Sybil Colefax and later Madeleine Castaing and John Fowler, also advocated using antique furnishings although these were frequently combined with more modern elements in order to create a more eclectic but at the same time classically elegant style. The work of John Fowler, in particular, was extremely influential in promoting the English Country House style that has proved so enduringly popular in wealthy upper-middle-class circles since World War II.

For more middle income homeowners of the late 19th and early 20th century the choice of period furnishings was seemingly endless and the profusion of hybrid styles is extremely difficult to disentangle. But it was 18th-century English furniture which provided the mass of objects for the amateur collector and which most readily provided the comfort required of the new type of home. This period also had the additional advantage that many pieces could be labelled with the name of a designer. Chippendale was probably the best-known name and the most misused. H.J. Jennings explained:

It may be taken for granted that a vast deal of the so-called “chippendale” furniture was not manufactured by Chippendale at all – was not even designed by him. And here it is permissible to say a word concerning the ignorance with which a great many people talk about this interesting but rather vague personality of the eighteenth century. When a few years ago the beauty and refinement of old cabinet-work came into more general recognition, they caught up the name of Chippendale, and have been

repeating it, they and their parrot-like successors – with the persistency of Poe's *Raven* ever since ... they prate about Chippendale, and fly into noisy raptures over any article, no matter how devoid of taste, that goes by his name.

One of the most successful manufacturers of reproduction furniture in East London this century carried the name Chippendale Workshops. With West End showrooms that stocked antique furniture alongside their own fine reproductions such firms did much to erode the distinction. Many people who became homeowners during the inter-war years in Britain were unconcerned about authenticity; what mattered was quality and durability.

During the 1950s young artistic couples setting up home began to collect second-hand Victorian furniture because it was cheap and well-made compared to the mass-produced furniture of the post-war period. This precipitated the craze for Victoriana in the 1960s. The revivalist and Authentic Decor movements of the 1980s have promoted a taste for the furnishings of many different periods and have encouraged the proliferation of antique shops and markets we see today.

JULIA PORTER

Selected Collections

Good collections of 19th- and 20th-century decorating books, periodicals and trade catalogues are available in the Geffrye Museum, and the Silver Studio Collection, Middlesex University, London, and in the design library of the Cooper-Hewitt Museum, New York. The National Monuments Record, London, holds a large collection of H. Bedford Lemere's photographs of late Victorian and Edwardian interiors, which demonstrate the exuberance of period styles. Several well-documented pieces of 19th century reproduction furniture are in the Victoria and Albert Museum, London.

Further Reading

There is no monograph devoted to this subject, but a useful survey of the history and origins of the collecting of antiques appears in Muthesius 1988. Additional and, at times, more revealing information can be found in contemporary decorating books, periodicals and trade catalogues.

Arabesque and Grotesque

Arabesque and Grotesque forms have been arguably the most popular and widely-used forms of ornament in the history of decoration and interior design. Originating in Roman times, they have played an important role in determining styles of surface decoration across several different cultures and nationalities and over many different periods. Versions of arabesque and grotesque motifs have also been used on a wide variety of two- and three-dimensional objects and in a range of different media including painted and printed designs, woven textiles, inlaid furnishings and engraved metalwork. Their use within interior decoration has been particularly significant, traversing the Renaissance, Mannerist and Neo-Classical periods, and encompassing the work of some of the most celebrated artists and designers from the 16th to the 19th centuries.

Although the descriptive adjectives *arabesque* and *grotesque* came into the vocabulary from different circumstances, they have a common source in Ancient Rome where a flowing, fanciful form of painted decoration incorporating scrolls, animals and flowers framing landscape scenes or mythological figures was used on walls and ceilings in the 2nd century BC and, to a lesser extent, in carved marble acanthus and vine scrolls, as well as in mosaics. These ornaments, especially scrolls and tendrils which acquired a religious significance, continued to be used in mosaics in Early Christian churches in Rome, Ravenna and Sicily, as well as in decoration in the Byzantine Eastern Empire. When the latter collapsed and was partly overrun by the Arabs they adopted many of these decorative characteristics while omitting human and animal forms. Hence the complicated interwoven and geometric patterns of Arabian and Moresque ornament which developed from around the 12th century. This, in turn, began to return to Europe in the form of patterns on damascened (inlaid with gold or silver) and engraved metalwork from Mesopotamia, Persia and Syria. Oriental carpets, too, with their repeating patterns of medallions and cartouches embedded in field patterns of flowing stems or with geometric strap patterns, may be regarded as another arabesque influence. Both metalwork and carpets were imported through Venice, and the velvets and damasks (another reference to Damascus) worn in Venetian paintings of the 15th century illustrate the vogue for arabesque ornament, which was given another and more important direction towards the end of the century in Rome.

Giorgio Vasari is the great source of information about

Arabesque and Grotesque: detail of satin bedtester, decorated with appliqué and embroidered with Renaissance design of strapwork and grotesques, French, c.1550

what he called “the new fashion of grotesques”. In his famous *Lives of the Most Eminent Painters, Sculptors and Architects* he credited the painter Morto da Feltro with the introduction of the rediscovered 2nd century BC painted and stucco decoration on the walls and ceilings of the Imperial palaces of Nero and Titus, which by that time had become buried under accumulated earth so that they could be entered only through shafts as if they were *grotte* or caves. Hence the name *grotteschi*. Vasari described how Raphael and Giovanni da Udine were “struck with amazement [at] these grotesques ... executed with so much design, with fantasies so varied and so bizarre, with their delicate ornaments of stucco divided by various fields of colour, and with their little scenes so pleasing and beautiful”. These light and airy, often fantastic, decorations introduced a freedom of expression to the late 15th century artists who viewed what remained of them by torchlight.

It is the name of Raphael that is most closely associated with the revival and development of grotesque decoration. In 1516 he was decorating two rooms in the Vatican for Cardinal Bibbiena; the smaller was painted in wax and was dark in colour because of the use of Pompeian red. Ovid’s *Metamorphoses* provided the subjects of the little ceiling and wall scenes within painted frames, and cupids ride on chariots drawn by unlikely creatures. The walls and ceiling of the larger *logetta* are decorated with mythological scenes within cartouches and medallions which are surrounded by garlands of leaves, cherubs, birds, masks and hour-glasses against a white background, while *trompe-l’oeil* niches contain figures of the Seasons.

Raphael’s next commission in this manner was for the more famous *loggie* in the Vatican for Leo X, a work with an extraordinary progeny. A gallery, originally open, was designed by Bramante but left unfinished when he died in 1514. Raphael completed the building and designed the overall decoration of the thirteen vaulted bays as an intricate arrangement of stucco and fresco decoration. Each bay is different in design, but there is an overall unity of concept and colour, and a varied arrangement of major elements such as cartouches and medallions on the walls, vaults and pillars. According to Vasari, this was executed largely by Giovanni da Udine under Raphael’s direction, and he wrote with enthusiasm of the lifelike birds with their bright plumage, the vegetables and fruits, the garlands of flowers, the musical instruments, the fishes and sea-monsters that were all to be found in “the most beautiful, the most rare, and the most excellent painting that has ever been seen by mortal eye”. Giovanni also worked with Raphael and Giulio Romano (who decorated an exquisite bathroom in this manner in Castel Sant’Angelo for Pope Clement VII) on the Villa Madama, a suburban residence for Leo X and Cardinal Giulio de’Medici. Work began in 1518, but the death of Raphael in 1520, followed by that of the Pope the next year, meant that only a fragment of the whole design was realised. Nevertheless, the portico with its delicate stuccowork on the walls and its vaulting painted with disciplined grotesque decoration, is among the finest examples of this brilliant style.

Another celebrated example is Pirro Ligorio’s *Casina* in the Vatican for Pius IV, in which he had the assistance of Federico Barocci; but the fashion for grotesque decoration also spread to other Italian cities. Baldassare Peruzzi is credited with the appropriately named *Sala detta del Magnifico* in the Palazzo

Vecchio, Florence, and there are endless examples in Tuscany and the Veneto in private palaces and villas. Among them reference must be made to Palazzo Farnese, Caprarola, where in the 1560s Taddeo and Federico Zuccari painted the ceilings of the huge rooms with mythological scenes set in elaborate grotesque decoration on a white ground. Each ceiling had to follow a detailed programme provided by Cardinal Alessandro Farnese. The famous open circular staircase leading up to them was painted by Antonio Tempesta in the 1580s; the walls and barrel vaulting are completely covered with grotesque panels, niches, large landscapes, and the crowning dome has three tiers of allegorical figures and *putti*, rising to the escutcheon of the Farnese family.

Italian artists worked in France and England. At Fontainebleau, Rosso Fiorentino from 1530 to 1540 and Francesco Primaticcio from 1540 to 1570 introduced elements of the grotesque in the Mannerist decoration for François I and founded a School of Fontainebleau continued by other artists, Ambroise Dubois, Martin Fréminet and Toussaint Dubreuil who worked for Henri IV and Marie de’ Medici at the end of the 16th century. Grotesques still played a part in their designs. There was nothing comparable in England, but painted grotesque panels now at Loseley Park, Surrey, probably from a royal house (maybe Henry VIII’s Nonesuch) and dateable to the 1540s, are very likely Italian in origin. The decorated pilaster strip, Roman in origin, in which repeated vase or candelabrum shapes are surrounded by freely flowing scrolls, tendrils and snakes, appeared in Italian paintings before the end of the 15th century, and it was used in inlaid choir stalls and marble wall monuments as well as in grotesque stucco decoration throughout the 16th century. It was this type of decoration that introduced grotesque ornament to other European countries. Simon Thurley in *The Royal Palaces of Tudor England* (1993) illustrates how such patterns as those engraved by Giovanni Pietro da Birago were closely followed in carvings in the Château de Gaillon in Normandy, while Margaret Jourdain in *English Interior Decoration* (1950) has made the connection between an engraving of a panel of grotesque ornament by Abraham de Bruyn and a chimneypiece at Boston House, Brentford, Middlesex. Hans Holbein’s painting of *Henry VIII and the Barber-Surgeons* (1540) shows grotesque pilaster strips on the wall, and one by an unknown artist of *The Somerset House Conference* (1604) includes pilaster strips in the background and an imported oriental carpet on the table – a combination of grotesque and arabesque.

Henry VIII’s break with Rome led to a change in European artistic currents and to the increased influence of Flemish and German pattern books, such as those by Vredeman de Vries and Wendel Dietterlin with their tortured versions of Mannerist decoration which included, *inter alia*, strapwork which, in a simplified form, could be used in woodwork and plasterwork. Some of these designs suggest why the term *grotesque* began to acquire a different meaning and *arabesque* became more commonly used. The flattened form of strapwork decoration, although related to grotesques, seems to have acquired some literally arabesque qualities, and the star-shaped patterns of ribs in some ceilings sometimes suggest an Eastern influence, while that in the Cartoon Gallery at Knole, Kent (early 17th century) could be a design for damask, although

Arabesque and Grotesque: engraving by Jean I Berain (1640–1711)

the wall pilasters are strongly Raphaelesque. The riotous exhibition of strapwork in the Great Hall at Hatfield House, Hertfordshire (c.1610) is an extreme example of what had happened to the graceful Italian *grotteschi* in their passage to England.

In France, versions of the grotesque were incorporated in the designs of Jean Berain, who designed architectural details, furniture, paneling and wall hangings in which fantastic architecture combined with sphinxes, satyrs, cupids and festoons. Similar designs were introduced in the tortoiseshell and brass marquetry furniture known as Boullework after the name of the royal *ébéniste* to Louis XIV, André-Charles Boulle, who collaborated with Berain in a publication, *Nouveaux Deisseries de Meubles et ouvrages* (from 1707) but the inlay technique was probably derived from imported damascened metalwork.

The decorative painter Andien de Clermont's work at Radnor House, Twickenham (c.1740–45) and Kirtlington Park, Oxfordshire (c.1745) is light-hearted Rococo-grotesque in style, but a more serious revival was prompted partly by the excavations at Herculaneum and Pompeii, and partly by the influx of architects from England and France who went to Rome to study Antique architecture and decoration; at the same time they rediscovered Raphael's *loggia*. James Stuart's Painted Room at Spencer House, London (1759) is an early example of the new trend, but Robert Adam was more accurate in his versions which were based on his own investigations with Charles-Louis Clérissieu in Rome (e.g., the Dining Room, Osterley Park c.1766–68; the Library at Kenwood, 1767–69; and the Dining Room, Shardeloes c.1761). Grotesque pilaster strips derived from the Vatican *loggia* and low relief wall panels in grotesque / arabesque style became hallmarks of the Adam style, in which such skilled painters as Biagio Rebecca collaborated. James Wyatt, again with Rebecca's assistance, worked in a similar style (e.g., the Cupola Room at Heaton Hall c.1772 and the Saloon at Heveningham Hall c.1797–99). The publication of George Richardson's *A Book of Ceilings in the Style of the Antique Grotesque* (1776) as well as the Adam brothers' *Works in Architecture* (1773–79) provided models for copying.

Clérissieu was able to take advantage of his studies with Adam to devise grotesque decoration in several countries. In Rome there was the coffee house at Villa Albani, (1764), in Paris one of the rooms in the Hôtel de la Reynière "dans le style arabesque" (c.1775); and he made designs for similar decoration in a Roman House at St. Petersburg (1773). Etienne de la Vallée also painted panels for the Hôtel de la Reynière and he published *Nouvelles Collection d'arabesques propres à la décoration des appartements* (1778). There was similar decoration in François-Joseph Bélanger's Pavillon de Bagatelle (1777) and for Marie-Antoinette at Fontainebleau (1780–85) by the Rousseau brothers. The exquisitely hand-blocked wall-papers designed by Jean Baptiste Fay and printed by J.-B. Réveillon in the 1780s made the style even more accessible. In Italy there are countless late 18th century examples of variants on the grotesque, although there too arabesque had become the favoured description. Stefano Tofanelli's decoration of the main rooms in Villa Mansi, Segromigno in the 1780s is an outstanding and imaginative sequence. In Rome the great rooms in Villa Borghese were systematically redecorated by

Antonio and Mario Asprucci from 1781, and later by Luigi Canina.

It was a fashion that was easily absorbed into the Imperial taste of the early 19th century, exemplified by the work of Napoleon's favourite architects, Percier and Fontaine, and it was strong enough to survive for many decades. A more archaeological and boldly coloured revival of Roman styles of decoration, for example, had emerged c.1800 with the so-called Pompeian style, stimulated by new discoveries and excavations at Pompeii. Versions of this style appeared in Germany and France throughout the first and second quarters of the 19th century; Karl Friedrich Schinkel designed a Pompeian tea salon for Friedrich William IV in Schloss Charlottenburg (1820s) and Alfred Normand recreated a Pompeian interior for Prince Jérôme Napoleon's Paris house (1854–59).

A more recent flowering of grotesque and arabesque ornament occurred among Renaissance Revival designers of the mid- and late 19th century such as the artist and designer Alfred Stevens, and his contemporary Godfrey Sykes. Much of Sykes's work, supervising the decoration of the South Kensington Museum (now the Victoria and Albert Museum), survives today, and illustrates not only the vigorous character of his Italianate grotesques but also the longevity and enduring appeal of this style.

Arad, Ron 1951-

Israeli-born architect and designer

Ron Arad is not so much an architect and designer as a sculptor of furniture and spaces, whose work has pushed the range of acceptable materials and decorative details to their limits. A familiar figure within London's design avant-garde, he first worked in a broadly High-Tech manner. Subsequently, however, his name became associated with a post-punk or post-holocaust aesthetic. This association was particularly strong in his interiors of the late 1980s where his use of deliberately coarse industrial materials evoked dramatic, albeit somewhat brutal, images of destruction and decay. His furniture, characterised by oversized forms and salvaged materials, has an equally powerful and expressive presence. Arad has been described by the architect Richard Rogers as a "poet of technology", and his work exemplifies the ironies and contradictions of a post-modern age.

Born in Israel, Arad trained at the Bezalel Academy of Art in Jerusalem between 1971 and 1973, and then at the Architectural Association, London, where he studied under Peter Cook, the founder of the architectural group Archigram. After a brief period working in an architectural practice, he formed the design studio and furniture workshop, One-Off, with furniture entrepreneur Dennis Groves in 1981. One-Off grew to encompass gallery and showroom functions. Initially, Arad's aim was to produce individually customised designs; most furnished fashionable retail interiors or offices. But since then, One-Off has been commissioned to create whole interiors, and has worked with furniture manufacturers in Italy to make larger editions of Arad's furniture.

Many of Arad's most well-known pieces of furniture include found objects and materials salvaged from scrapyards, but he is highly selective about the objects he chooses and how they are manipulated. They are selected for particular reasons, such as their shape or their texture, and Arad has described his search for the most suitable items of wreckage as an art in itself.

One such found object, a red VW fender, appears in the 1987 interior of his Shelton Street One-Off showroom. The visitor enters through a roller shutter door into an antechamber of raw, welded steel which curls back to expose yet another welded skin, this one of sleek, chemically treated steel. The floor is made of multi-coloured concrete, coated with polyurethane to give the material a radiance. The only light entering the space comes through a lace-like tracery created by random applications of welding. Arad uses a blow torch like a pencil; his sketches are fast and immediate, and the light penetrating these squiggly lines unexpectedly reveals phrases in English and Hebrew. The remaining solid areas resemble animal and vegetable figures. Not surprisingly, Arad designed all of the showroom's furniture, as well as the pieces on display. The reception desk rests on steel strips which curve in opposite directions. The bar counter – lit from within – is

composed of several sheets of metal, cut like filigree. A gallery space in the back of the showroom exhibits work by young designers who share Arad's interest in a rough, constructional aesthetic and in confronting technology and the machine. The actual furniture-making takes place in a Holborn welding shop. Arad's signature piece, the *Rover* chair, featuring a recycled leather seat salvaged from a British Rover car encased in a tubular steel frame, is one of the most celebrated pieces of furniture displayed in the showroom.

Arad has also designed a number of small shops and studios for the fashion industry. He was the interior architect on the Bureaux Clothing Group's design studio, located in a 19th century warehouse on the Thames side of the Metropolitan Wharf in London's Docklands. He designed the drawing boards out of plates of glass resting on tubular steel scaffolding which, in turn, are cantilevered from the main timber columns of the warehouse. The staircase is built out of railway sleepers, and its handrail – curved to resemble reeds blowing in the wind – was made from galvanized steel tubes. The balcony railing uses a similar vocabulary. Arad often collaborated with the designer Danny Lane on works involving glass, and in the rear of the studio Lane designed a screen of etched and clear glass to define a conference area. Arad's rough-edged granite conference table rests on criss-crossed railway sleepers and is surrounded by his horn chairs. Pyramidal lamp shades of rusted sheet steel, scored with welded spirals, carry light into the workspace.

A more public exposition of this raw, industrial aesthetic was revealed in his interiors for the clothes shop, Bazaar, in London's South Molton Street (1984). Huge broken slabs of concrete hung from rusty hawsers, and clothing-rails were supported by life-size cast-concrete figures. The atmosphere was one of dislocation, destruction and decay.

Arad's furniture designs, by contrast, are more ironic and playful. His *Big Easy* chair is featured in New York's Metropolitan Museum of Art's collection of 1980s furniture. The armchair consists of a large quantity of sheet steel welded into a form derived from old, overstuffed upholstered chairs. The steel is burnished to create a "soft" fabric feel and the hollow frame is filled with a ballast of sand so that it can be manipulated into a variety of positions, adjusting to the movements of its user.

Big Easy Volume 2 is another hollow armchair constructed from a single piece of sheet metal. Viewed from the front, its large cylindrical arms look like Mickey Mouse ears. The back is formed out of a concave sheet of steel, following the material's inherent curvature. The metal surface is chemically-treated and then waxed, giving it the appearance of elephant-hide, and the welded edges along the chair's seams suggest traditional piping. Surprisingly comfortable, the *Big Easy* series shows that comfort can be achieved using even the most unlikely of industrial materials.

The *Well-Tempered* chair, currently manufactured in limited numbers by Vitra Editions, is another variation on the overstuffed chair theme. Four sheets of steel are bolted together to form the chair's shape. The springy steel moves slightly with the user, creating a soft cushion out of the hard material. In describing the attractions of steel, Arad has said, "It's the easiest material to work in. I don't know of any other technique where you can do such big pieces. And it's friendly."

Arad: *Rover* chair, 1985

In recent years, Arad has moved towards the mass production of some of his designs. Originally produced as a limited edition in steel, the *Bookworm* bookcase system, for example, has been reinterpreted in translucent, pliable plastic for more general consumption and is being produced by Kartell, an Italian furniture manufacturer known for its innovative work with plastics. The worm-like bookshelf slithers across a wall in a path determined by the individual user. The modules come in ten-foot long coils and are supported vertically at twenty-inch intervals.

The *Metaply* Collection is part of a series of works designed specifically for mass-production, for the Aleph division of the Italian manufacturer, Driade. The table, chair and folding

trolley are made of moulded, light coloured, walnut plywood. The materials and forms are reminiscent of work designed by Charles and Ray Eames in the 1950s and 1960s. But Arad adds spice to the organic, wood composition by contrasting the warm woods with the use of cold aluminium and steel, which serve as both structural and design elements. The table, known as *Fly Ply*, has a double set of retractable, insect-like legs that fold inconspicuously into the underside of the table so that it can alternate between cocktail and dining heights.

A *Suitable Case* was shown in Milan in 1993. The beautifully crafted wooden container opens to reveal unexpectedly a metal chair. Named the *London Papadelle*, after an Italian ribbon noodle pasta, the seat is made of ribbon-like woven

metal mesh that rolls downwards into a “carpet”. This “carpet” can be unrolled for an additional ten feet across the floor.

In 1989, Arad established the design and architectural practice Ron Arad Associates. In conjunction with his partner, the Canadian architect Alison Brooks, he designed the interiors of the foyers for the Tel Aviv Opera House. The building itself was designed by the Israeli architect Yacov Richter, with whom Arad had previously worked while he was student at the Architectural Association, and it was opened to the public in the autumn of 1994. Meanwhile, Arad has continued to expand his mass-produced furniture lines: smooth polished metal has replaced the battered sheet metal of his earlier days and he has added table accessories to his repertoire. Ron Arad Associates are also designing the interiors of restaurants in London, such as the new Belgo Centraal in Covent Garden (1994–95), and have designed boutiques in Milan, including Michelle Mabelle (1994).

Arad's skill lies in the combination of his first-hand knowledge of materials, which allows him to form mass and texture like a sculptor, and his conceptual abilities, which allow him to define space like an architect. He advocates a pluralist approach to design. He is not interested in the view that only some materials are acceptable, but actively promotes the idea that everything and anything that is available in the post-industrial world can be used in furnishings and interiors. The important criterion is how materials and objects are put together and combined. He has claimed that “the biggest influence on my work is my work”, and that exploration has become the focus of his work.

SALLY L. LEVINE

Biography

Born in Tel Aviv, 1951. Studied at the Bezalel Academy of Art, Jerusalem, and at the Architectural Association, London. Lived and worked in London from 1973; co-founder with Caroline Thorman, of the design and production studio One-Off, with showrooms in Covent Garden and Holborn, 1981; established Ron Arad Associates architecture and design practice with Caroline Thorman and the Canadian architect Alison Brooks, 1989; founded the design and production unit Ron Arad Studio, Como, Italy, 1994. Guest professor, Hochschule, Vienna; guest editor of the 1994 *International Design Yearbook*. Arad has also supplied furniture and product designs for many international firms including Alessi, Driade, Kartel, Knoll International, Swatch, and Vitra International; he has participated in many group and solo exhibitions in Europe, Israel and Japan.

Selected Works

Examples of Arad's furnishings are in the Design Museum, and the Victoria and Albert Museum, London; the Metropolitan Museum of Art, New York; the Centre Georges Pompidou, Paris; the Tel Aviv Museum; and the Vitra Design Museum, Weil am Rhein.

Interiors

- 1984 Bazaar, South Molton Street, London (shop interiors and display system): Jean-Paul Gaultier
- 1986 Equation, Bristol (shop interiors)
- 1986 The Bureau, Metropolitan Wharf, London (design and fashion studio interiors)
- 1987 One Off studio, Covent Garden, London (furniture showroom and design studio interiors)
- 1988–94 New Tel Aviv Opera (foyer architecture and interiors)

- 1989–91 Ron Arad Associates, Chalk Farm Road, London (studio, gallery and workshops; conversion and interiors)
- 1993–94 Belgo Restaurant and Bar, London (interiors and furnishings)
- 1994 Michelle Mabelle, via della Spiga, Milan (shop refurbishment and interiors)
- 1994–95 Belgo Centraal, Covent Garden, London (restaurant, offices etc.; conversion and interiors)

Arad's furniture includes his *Rover Chair* (1985), the *Well Tempered Chair* (1985) the *Big Easy* series (1989), the *Metaply Collection*, and the *Suitable Case* and *London Papadelle* (1993).

Architect, history and role of

The history of the role played by architects in determining the appearance of the interiors of buildings is a vast and complex subject and the extent of their involvement has changed quite radically over the past five hundred years. In 1812 the French architects Charles Percier and Pierre-François-Léonard Fontaine declared “Furniture is too much a part of interior design for the architect to remain indifferent to it”, thus stressing their belief that architects should exercise overall control in the relationship between architecture, decoration and furnishings, even down to the placing of furniture as part of the total design. This was a concept that had been perfected in the second half of the 18th century by Robert and James Adam in whose major interiors virtually every element – including the ceilings and walls, chimneypieces and doors, moveable furni-

ture and carpets, silverware and metalwork – all bore the mark of a single directing mind, and an all-embracing style and colour scheme. But such control was a comparatively new phenomenon and represented a culminating point in the rise of the professional architect, the idea of integrated design, and the relationship between designers and craftsmen, which had been developing since the 16th century.

Throughout the Middle Ages and for much of the Renaissance period, in most European countries the architect was usually a master-mason or artisan who had no expertise outside the sphere of building and only limited knowledge of recent developments within his own field. Although he was responsible for providing designs for the general plan for the building, the drawing of details such as the roof and woodwork were assigned to the master-carpenter and other craftsmen. The master-mason's contribution to the interior concentrated upon the built, fixed elements – notably the fireplace and the staircase – while the wood ceilings and panelling were the responsibility of the master-carpenter. Other work, such as the decorations and furnishings, were assigned to specialist craftsmen and painters, and more often than not it was the patron or client who exercised overall control of the building of his house and the shaping of its interiors.

With the publication of treatises on architecture, which appeared from the early 16th century, came the first step on the road towards the establishment of architecture as an educated and gentlemanly profession. The majority of these books, however, were principally based on a knowledge of Classical rules and the Orders and comparatively little attention was paid to interior details, although not surprisingly fireplaces featured quite prominently. Sebastiano Serlio (1475–1554), for example, whose writings were widely referred to and translated into several languages, offered designs for elaborate, canopied fireplaces which incorporated individual interpretations of classical motifs; he also included illustrations of doorways and ceilings. Andrea Palladio (1508–1580) provided plans and elevations of villas and town houses in his *Quattro Libri* (1570), but significantly he gave no indication of how the interiors might be treated. In his text he gave some general advice about flooring materials and ceilings, and he designed internal doorways and fireplaces, but there is no reason to suppose that he was consulted about the decoration of the rooms, even in such a residence as the Villa Barbaro at Maser, in which Paolo Veronese's frescoes so perfectly complement the architectural form and the spirit of the building.

Italian artists and architects were the first to take the lead in participating more fully in the design of interiors. Raphael (1483–1520) devised overall decorative schemes of stucco and paint, relating the spatial and decorative elements in a masterly fashion, in his work in the Vatican and the Villa Madama, and in the Farnesina. And Giulio Romano (c.1499–1546), at one time Raphael's assistant, developed an individual treatment of interiors and an assumption of overall control over the decoration of rooms in Mantua. He was able to ensure that all the different elements of a room, or of some decorative ensemble, were in the same style and created a unity. He made detailed drawings for mural decoration which could be realised either in fresco or tapestry, and he also made some designs for elaborately decorated furniture of an architectural character. But

such control was comparatively rare and depended greatly on the character of the individual patron.

Outside of Italy, the more dominant role of the architect was initially evident in court circles, particularly in France. In the 1530s Francesco Primaticcio (1505–70), painter-sculptor-architect, who had worked with Giulio at Mantua, began work in the new rooms for François I at the Château of Fontainebleau, where woodwork, stucco and frescoes were combined in a riot of Mannerist decoration. The designs were executed by French, Italian and Belgian craftsmen who worked together and became proficient in the Franco-Italian Mannerist style. The application of this style to fireplaces, furniture and grotesque decoration permeated, for example, the published designs of Jacques Androuet DuCerceau the Elder (c.1515–85), and from the middle of the 16th century such books played a vital role in not only disseminating ideas throughout Northern Europe but also in underpinning the patron / architect / craftsmen relationship.

Louis Le Vau's (1612–70) appointment in the 1650s as overall controller of the building and decoration of the château of Vaux-le-Vicomte – described as “conjured up by a French architect-decorator and carried out entirely by Frenchmen” – marked another step towards artistic integration. Further steps were taken in 1662 when Jean-Baptiste Colbert (1619–83) re-established the royal Gobelins Workshops where the various artists and craftsmen all worked together under the artistic direction of Charles Le Brun (1619–90). The Gobelins was described by Sir Christopher Wren as “a School of Architecture, the best probably, at this day in Europe”.

In England, the notion of integrated interior design was advanced by Inigo Jones (1573–1652) in the 1620s and 1630s. Jones produced many drawings of chimneypieces and overmantels, decorated compartmented ceilings, and carved or painted swags, grotesques and putti, as well as actual buildings, where a French taste, facilitated by the availability of published designs by Jean Barbet and Pierre Collot and encouraged by Henrietta Maria, Charles I's French queen, is clearly evident. This lavish and innovative form of decoration was developed by John Webb (1611–72), Jones's assistant, in the rich interiors of Wilton House of the 1640s. Webb also produced internal elevations for Lamport Hall and advised on the purchase of pictures for this house. But although it might be assumed that both Jones and Webb would have at least been consulted about furnishings for their decorated rooms, there is little evidence that they themselves provided designs for furniture, although a drawing by Webb from the mid-1660s does indicate a bed and balustrade in the French fashion as a central element in a bedroom intended for Charles II. Carvers and plasterers made their own detailed designs which were submitted to the architect and the patron for approval; painters of large-scale wall and ceiling decorations generally worked quite independently of the architect.

One of the first architects to be personally concerned with the design of not only furniture but also upholstery was Daniel Marot (c.1663–1752). Trained in France, Marot had a working knowledge of the Louis XIV style of decoration, but more important was his work as an all-round architect in Holland and England, where he designed rooms and furnishings for several major buildings including the palaces of Het Loo and Hampton Court. The Louis XIV style was reflected in

Marot's published designs for beds, chairs, pelmets and curtains, chimneypieces, wall panelling and bookcases, all of which tended towards a unified scheme of decoration and furnishing. By this time too, architects' designs for complete wall treatments were becoming popular in France as could be seen in the work of Gilles-Marie Oppenord (1672–1742), Robert de Cotte (1656–1735) and Jacques Gabriel (1667–1742), and in the plates of Jacques-François Blondel's influential *De la distribution des maisons de plaisance et de la décoration des édifices en général* (1737–38) which, in some cases, also included furniture as an integral element in the design of Rococo rooms.

During the course of the 18th century the architect became more entrenched as not only a knowledgeable leader of a team of craftsmen but also as someone who could provide his own detailed interior designs. In England, John Talman (1677–1726) is credited with being the first such professional fully to integrate furniture, decoration and architecture, but the work of William Kent (1685/86–1748), who was active as an architect and designer as well as a decorative painter, is generally regarded as more important. Kent's most memorable interiors survive at Houghton, in Norfolk. Some of his designs for chimneypieces and architectural furniture as part of a total room treatment were published by John Vardy in 1744 who also made designs for furniture and produced some of the earliest known drawings for wall decoration which suggest the colours to be used. Vardy's designs were made for Spencer House, London, in 1755–57, a building for which James Stuart (1713–88) had made similar proposals. This significant step in an architect's total control of a room's decoration had already been taken in France and it was quickly adopted in England where a number of books on colour and painting, including Alexander Emerton's *Directions for Painting* (c.1753) and Robert Dossie's *Handmaid to the Arts* (1758) were available.

By this time, the role of the patron as director of proceedings was receding; the architect produced proposals for whole interiors to which the client could react, and the final appearance of the building was generally a compromise between these and the client's ideas. This development was encouraged by the greater attention paid to the making of drawings of interiors, generally in the form of an exploded ceiling or floor plan and four elevations, but sometimes as perspective views or as sectional drawings. This practice originated in France and Sir William Chambers, who was familiar with Parisian examples, made a sectional drawing of his proposals for York House (c.1759) which shows wall colours and patterns in detail, as well as major items of furniture which he evidently considered part of the overall design. Chambers also made it known that he wished to be consulted about Thomas Chippendale's designs for furniture in one of his houses "as I am really a very pretty connoisseur in furniture", and there is a reference elsewhere to "the assemblage and blending of couleurs [being] Great Principles of his [Chambers's] ... taste".

The assumption of greater architectural control culminated in the work of the Adam brothers, who collaborated with a team of master craftsmen including Thomas Chippendale, Joseph Rose and Matthew Boulton, but whose designs for complete rooms and furnishings were developed down to the smallest detail. Some 9000 of the drawings from their office, produced by a number of skilled draughtsmen including

George Richardson, Joseph Bonomi, and Charles-Louis Clérissieu, are in Sir John Soane's Museum, London, and they represent the most important of all collections of architects' coloured designs for interiors. In France, a similarly comprehensive approach to interiors was taken by Percier and Fontaine whose precise and carefully studied creation of rooms, in which every item of furniture played a part and had its place in the overall picture, was based on Antique and Renaissance sources. Theirs was the quintessence of architects' interiors in which nothing should be changed. Their *Recueil de décorations intérieures* (1812) was well known to English architects and the influence of their furniture designs can be seen in Rudolph Ackermann's much referred to *Repository of Arts* (1809–28). The German architect Karl Friedrich Schinkel (1781–1841) also designed complete interiors and furniture. Like that of Percier and Fontaine, Schinkel's work reflected historical styles and motifs, but his designs were also strongly individual, often simple in their interpretation, and essentially part of the whole decoration.

Despite the pre-eminence of figures such as the Adam Brothers, Schinkel, and Percier and Fontaine, there was still much vying for precedence between architects and other tradesmen who specialised in interior work during the 18th and early 19th centuries. This was particularly the case where there was no actual building work to be done and internal alterations were often carried out by upholsterers who undertook to supply not only furniture, wallpaper, and textiles but could also provide a complete decorating service. The English upholsterers Thomas Chippendale and William and John Linnell collaborated with architects such as Robert Adam, but they also refurbished interiors independently: Chippendale worked at Mersham Le Hatch, Kent and David Garrick's villa in Middlesex, and the Linnells at Bowood House, Wiltshire. In France, a similar role was played by *marchands-merciers* such as Dominique Daguerre, who also had a showroom in London and worked at Carlton House. Many of these firms occupied large premises situated in fashionable districts of London and Paris and the sums paid out for their services were often very large, sometimes even exceeding the cost of the building itself. Not surprisingly, this led to friction with the architectural profession. In 1824, the architect William Mitford claimed "The upholsterer's interest is in direct opposition to the architect's credit" (Thornton, 1978) and many architects were bitterly resentful of the influence wielded by upholsterers whom they regarded as purveyors of novelties and transient fashions.

This tension was particularly strong in the early part of the 19th century when upholsterers appear to have been in the ascendant and it subsided only in the second half of the century when it was replaced by a similar struggle with the emerging decorating trade. But by this time, the architectural profession had taken steps to bolster its position through a more formalised system of training and through the establishment of bodies such as the Institute (later Royal Institute) of British Architects (set up in 1834) which aimed to promote the "uniformity and respectability of practice" and which removed architects from building and decorative contracting, although not from the designing of decoration and furniture.

The mid-19th century spread of industrialisation in England brought with it an increasing gulf between commercial produc-

tion and architect-designed work. Within critical circles, this gulf was widened further by the Gothic Revival's critique of contemporary mass-produced design which culminated in the latter part of the 19th century in the emergence of the Arts and Crafts Movement. Stemming from the philosophies of A. W. N. Pugin, John Ruskin and William Morris, this Movement sought to break down the divisions between art, architecture and craft and promoted the greater involvement of artists and architects in domestic design. It was a Movement dominated by architects – Philip Webb (1831–1915), Richard Norman Shaw (1831–1912), Thomas Edward Collcutt (1840–1924), John Dando Sedding (1838–91), W. R. Lethaby (1857–1931), Arthur Heygate Mackmurdo (1851–1942), M. H. Baillie Scott (1865–1945) and C. F. A. Voysey (1857–1941) – all of whom and many more had a far more “hands-on” approach to design and were frequently involved in the design of complete interiors including decorations, furniture and textiles. They also also designed for commercial Art manufacturers and Art firms.

The Aesthetic Movement of the late 1860s was another fashionable manifestation of total design, based on the creed that a truly beautiful and harmonious interior needed contributions from architects and painters. Its leading exponent was E. W. Godwin (1833–86) who would take over the responsibility for a whole house when he had the opportunity, designing its exterior, its decorations and furnishings, and even mixing the paints and choosing the pictures and ornaments. Another architect working in the Anglo-Japanese style was Thomas Jeckyll (1827–81); he too would undertake an entire commission to build, decorate and furnish, but the Aesthetic interior was promoted principally through commercial firms, such as Liberty's in London, which could supply a whole range of Artistic and Japanese-style goods.

The concept of total design was also evident in the work of various exponents of Art Nouveau, including the Belgian architects Victor Horta (1861–1947), Gustave Serrurier-Bovy (1858–1910), Paul Hankar (1859–1901) and Henry van de Velde (1863–1957). In van de Velde's own house (1895) he created a complete and totally integrated environment, designing the furniture, lighting fittings and even dresses for his wife. Similarly complete interiors were created by other Art Nouveau and progressive architects including Hector Guimard (1867–1942), Josef Hoffmann (1870–1956), Charles Rennie Mackintosh (1868–1928), H. P. Berlage (1856–1934) and Frank Lloyd Wright (1867–1959). Although many of these figures developed in different directions in the later phases of their careers, they all remained constant to the idea that the architect should be in control of the inside of a building as well as its exterior. Frank Lloyd Wright recalled, “I tried to make my clients see that furniture and furnishings not built in as integral features of the building should be designed as attributes of whatever furniture was built in”. He spoke for many architects who believed in the integrity of interior design when complaining that “when the building itself was finished, the old furniture they possessed usually went in with the clients. Very few of these houses were anything but painful to me after the clients moved in and, helplessly, dragged the horrors of the Old Order along with them”.

The notion of the architect-designer presiding over the interior fitments, decorations and furnishings has continued to shape the appearance of many of the seminal buildings of the

20th century with noteworthy examples being produced by many of the century's most celebrated Modernists. The Schröder House (1924) by Gerrit Rietveld, Mies van der Rohe's German Pavilion at the Barcelona Exhibition (1929), and the Eames House (1945–49) by Charles Eames might be included in this list. But the 20th century has also seen control over the interior increasingly wrested from the architectural profession by the growing influence of interior decorators.

Emerging in the late 19th century, the interior decorator took over many of the functions of the upholsterer, but whereas upholsterers were generally perceived as tradesmen, decorators were frequently drawn from the same social class as their clients and included many educated female practitioners. Notable pioneers were Elsie de Wolfe in America and Nancy Lancaster and Sybil Colefax in Britain. With fewer domestic houses being custom built by architects, decorators have become increasingly important since the mid- and late 20th century and their influence is widely reflected in popular interiors and lifestyles magazines. Architects, meanwhile, have become more closely associated with corporate clients, providing the interiors and corporate image for company headquarters and office buildings. The recent provision of professional training for decorators has also helped to put them on a par with architects and the late 20th century has witnessed the emergence of “interior-architects” whose training represents a blend of design and architectural skills.

Art Deco

Art Deco is a term used to describe design of the period 1920-40 which uses expensive and exotic materials, angular forms and luscious colours. It is a luxury style created by French *ensembliers* (a term adopted around 1911 to describe designers of entire interiors) in a successful bid to assert France as the world leader of interior decoration and high style. Although not generally used until the late 1960s, the term Art Deco derives from the lavish exhibition staged during 1925 in Paris – the Exposition Internationale des Arts Décoratifs et Industriels Modernes. The Exposition was an international display of temporary pavilions, built on the banks of the Seine in the grand tradition of world trade fairs.

The stylistic roots of Art Deco lie in the avant-garde of the turn of century, and in 18th-century and early 19th-century French furniture. Louis XV, Louise XVI, Consulate, Empire and Directoire styles were all revived and combined with a new, geometric form in design, developed in Glasgow and Vienna. At the turn of the century Charles Rennie Mackintosh and the Glasgow School had created a new style in interior design based on sparse Japanese interiors and the Scottish baronial style. The vertical, geometric forms used by Mackintosh for his fantastic chair designs in particular proved influential in mainland Europe. The designers of the Vienna Secession and the Wiener Werkstätte used similar shapes in their interior designs. At the Palais Stoclet, built between 1905 and 1911, Josef Hoffmann and the Wiener Werkstätte designed a luxury villa in the suburbs of Brussels using comparable, angular geometric forms and expensive materials. This stripped classicism was also explored by early 20th-century designers in Germany, particularly those exhibiting at the Paris Salon d'Automne in 1910. Designers linked with the Munich Deutscher Werkbund at the Salon showed a proto-Modernist form of interior design, for example Karl Bertsch, the Munich decorator, showed a lady's bedroom which was criticised by French experts for its lack of femininity but was a popular success with the public. This galvanised the French design establishment into action to ensure that their place as leaders in taste and fashion was maintained. The idea of holding an international exhibition devoted entirely to new design was born.

Due to the interruption of World War I the Exposition Internationale des Arts Décoratifs et Industriels Modernes did not take place until 1925, by which time, ironically, much of the impetus of French Art Deco had passed. One of the most extravagant constructions at the Exposition was Le Pavillon d'un Collectionneur which was designed by Pierre Partout and decorated by Jacques-Emile Ruhlmann and a team of prominent French designers, all members of the Société des Artistes

Décorateurs which had been founded in 1901. Ruhlmann was the leading French *ensemblier* of the period, drawing upon past styles and combining this with Art Deco luxury. In the Grand Salon of the Pavillon hung a huge chandelier and the walls were covered with boldly patterned silk and topped by a classical entablature. The furniture in the room was based on French, 18th-century pieces and veneered with luxurious Macassar ebony. Ruhlmann continued to design in this extravagant Art Deco style throughout the 1920s and 1930s, always using the proportions of classical architecture and exclusive materials, including ivory, lizard-skin, shagreen, tortoiseshell and exotic hardwoods. He also undertook commissions for the Paris Chamber of Commerce and the cosmetics firm of Yardley. For the former he designed an imposing ballroom in the 19th-century Hotel Potocki. Chunky, ribbed pilasters line the walls, Cubist reliefs surround the mirrors and constitute the entablature. Grand chandeliers hang from the ceiling while a classically-inspired relief by Joseph Bernard decorates the main doorway.

Another important pavilion at the Exposition to showcase the work of French designers was that of the French Embassy, which consisted of 24 lavish rooms spread across two wings. Organised by the Société des Artistes Décorateurs and sponsored by the French government, the pavilion contained the soft *Chambre de Madame* furnished by André Groult. The velvet upholstery and curved, shagreen-covered, chest-of-drawers conjured up a feminine ambience. This contrasted with the modern reception area designed by Robert Mallet-Stevens. Art Deco was not only inspired by the French past. The sunrise motif used by Groult on the bed in the *Chambre de Madame* was probably inspired by ancient Egyptian art, a common source for designers following the discovery of Tutankhamen's tomb in 1922. The avant-garde painting style of Cubism was also an important influence on Art Deco. Indeed, there was a direct link between Cubism and interior design when, in 1912 at the Salon d'Automne the traditional designers Louise Süe and André Mare collaborated with the minor French Cubists Roger de la Fresnaye, Raymond Duchamp-Villon and Jacques Villon on the *Maison Cubiste*. This working partnership continued with the founding of the decorating firm, *Compagnie des Arts Français* in 1919. At the Exposition the *Compagnie* designed the *Musée d'Art Contemporain* to publicise their lavish room settings. The Parisian department stores who were to be so important in the promotion of the Art Deco style each sponsored a pavilion.

Galleries Lafayette's studio, *La Maitrise*, was headed by Maurice Dufrene. The lavish exterior of *La Maitrise's* pavilion was designed by a team of three architects – Georges Beau, Joseph Hiriart and Georges Tribout. The interior was designed by Dufrene and contained an exhibition hall plus five model interiors – a man's bedroom, salon, dining room, study and women's bedroom. The interior of *Bon Marché's* Pomone pavilion was designed by director Paul Follot, who had joined the department store in 1923. The Grand Salon of the Pomone pavilion was decorated with a bold mix of angular patterns and stylised flowers on the carpet, panels of the display cabinets and entablature. *Au Printemps's* Primavera was designed by director Charlotte Chauchet-Guillere. The Louvre's own Stadium Louvre was octagonal in outline plan, decorated with urns and carved and real plants with an exterior terrace. Inside

Art Deco: Grand Salon, Pavillon d'un Collectionneur, by Jacques-Emile Ruhlmann, 1925 Paris Exposition des Arts Décoratifs et Industriels

was the familiar mix of traditionally inspired furniture, finished with rare veneers.

One of the most important inspirations for Art Deco interior design was non-Western art. The exotic allure of African and Oceanic forms was exploited by Pierre Legrain in his design of a curved seat based on an Ashanti stool, exhibited at the 1923 Salon des Artistes Décorateurs, and a chair from the following year veneered in palmwood with parchment seating. Legrain contributed some important, exotically inspired furniture to the lavish interior of couturier and art collector Jacques Doucet's home, designed in 1929 at Neuilly. The villa contained important Art Deco furniture including a Japanese inspired, occasional table with sharkskin inlay by Rose Adler which supported an abstract, crystal sculpture by Gustave Miklos. Many of the pieces from the Doucet Villa can now be seen at the Virginia Museum of Fine Arts.

The exotic also inspired the rich variety of metalwork furniture and fittings produced by Art Deco designers. Armand-Albert Rateau created disturbing interiors using strange bird forms cast in bronze, which supported tables and were even used for taps. The apartment he designed for the couturier Jeanne Lanvin in Paris featured a low table with patinated bronze birds supporting a marble top, set in a bedroom hung with embroidered blue silk. The bathroom designed for the same commission featured a carved wall panel in stucco, deco-

rated with a forest scene, the cream Siena marble bath and washbasin contrasted with the patinated bronze lights fittings, taps and mirror.

The adventurous use of colour was certainly an essential feature of the Art Deco interior and was partly inspired by the fashion for the exotic. This inspired the stage designs of Léon Bakst for the Ballet Russes. Serge Diaghilev's ballet, *Schéhérazade*, was performed in Paris in 1910, and the vivid colours, bold patterns and evocation of a distant, exotic land only heightened the contemporary fashion for Persian and Arabian themes. Modernist painters were also experimenting with colour and form at this time and certainly influenced Art Deco. Orphism was one movement which developed just before World War I in Paris. The chief exponents, Sonia and Robert Delaunay, liberated colour from the formal concerns of easel painting. Sonia Delaunay applied the experiments of Orphism to textile design during the 1920s, decorating their home with geometrically patterned rugs and furnishing fabrics in multi-coloured hues. Another group of painters to experiment with colour were the Fauves or Wild Beasts. The major artists in the group, Matisse, Derain and Vlaminck worked between 1905 and 1908 using vivid colours in amazing combinations. Such shocking contrasts were used by designers as a reaction to the insipid pastels of Art Nouveau.

The designer to best exploit an exotic atmosphere and

Art Deco: suburban lounge of the late 1930s; re-created in the Geffrye Museum, London

strong colours was Paul Poiret. He was originally a haute-couture designer who produced flowing dresses which liberated women from the corset. Poiret established the *Atelier Martine* in 1912 which was responsible for decorating his new shop, used to sell his own brand of perfume, *Rosine*. Poiret employed the Fauve artist, Raoul Dufy to design fabrics for his new firm. Young, working-class women were also used by Poiret to design bold, bright fabrics and surface patterns. The *Atelier* successfully designed and sold printed fabrics, wallpapers, ceramics, rugs and embroideries in addition to undertaking entire interior design commissions. The *Atelier Martine* designed three barges for the 1925 Exposition. These were painted on the exterior with exotic flowers and moored on the Left Bank of the Seine. Inside the *Amours* barge, the main living area was littered with huge cushions for informal seating, the walls were painted with palm trees and other strange flora which also decorated the carpeting. Poiret did not distinguish between textiles for clothing and textiles for the interior; this interaction between women's fashion and design typifies Art Deco. It was conceived as a style to challenge the masculine look of German, Modern design and wallowed in the decorative, the exotic and the amusing.

For political reasons Germany was effectively excluded from the 1925 Exposition because their invitation was not sent until it was too late for them to participate. America also refrained from participating in this show. Herbert Hoover, then Secretary of Commerce, claimed that American design was not in a position to offer "new and really original" design for international exhibitions although the real reason probably had more to do with costs than with aesthetics. Britain made a

small contribution, with a pavilion designed by Easton and Robertson in Moorish style. The Exposition certainly ensured France's stylistic leadership of interior design and high fashion, and guaranteed the spread of the Art Deco style throughout the Western world, as visitors to the exhibition and the media carried news of the show.

The Art Deco style reached America partly through exhibitions of artifacts from Paris. In 1926 the Metropolitan Museum of Art in New York organised a touring exhibition of design objects and established a permanent gallery for the display of furniture bought at the Exposition. Department stores such as Saks, Macy's, and Lord and Taylor exhibited examples of French Art Deco after 1925. Thirty-six museums and department stores featured Art Deco furniture in their displays during 1925 to 1928. Brash and new, the Art Deco style was highly influential in America, and lent itself to the repeated, geometric patterns of mass production techniques pioneered in the US. Joseph Urban had emigrated to New York from Vienna in 1911 to set up a small design consultancy. In 1922 he established the *Wiener Werkstätte* of America, which produced geometric furniture and furnishings in the spirit of the Austrian prototype. Urban used the Art Deco style for the design of the Century of Progress exhibition in Chicago (1930). His Travel and Transport pavilion used the rising sun motif and the ziggurat profile. The Art Deco style was adopted for the design of buildings as diverse as modest hotels in Miami to New York skyscrapers.

The skyscraper was a building form introduced in New York during the 1870s and in Chicago during the following decade. During the 20th century skyscrapers were built in

Art Deco: block-printed wallpaper, 1933

every major American city and presented a unique interior design problem – how could the interior equal the sheer scale and magnificence of the exterior. Ely Jacques Kahn was one of the most prominent of America's interior designers of the time and created several impressive entrance lobbies including the Lefcourt Clothing Center on Wall Street, the Film Center and the Bricken Building, John Street. Two of the most important Art Deco buildings in New York are the Chrysler Building (1928–30) and the Empire State Building (1930–32). Designed by William Van Alen for the automobile corporation, the stepped exterior of the Chrysler Building is decorated with modern gargoyles and hub-caps. The lobby is decorated with rich red marble, Art Deco ironwork by Oscar Bach, and elevator doors veneered with light amber and dark brown woods in a geometric lotus design. The Empire State Building was designed by Shreve, Lamb & Harmon and built in stone with aluminium and nickel exterior decoration. The interior features Art Deco motifs from the zig-zag floor decoration to stepped balustrades and ceilings. Another key example of New York, high-rise Art Deco is the Chanin Building dating from 1929 on 42nd Street and Lexington Avenue. The interior decoration was orchestrated by Jacques Delamarre, head of the Chanin Construction Company. The 50th floor of the building

featured an Art Deco auditorium and the 52nd floor an executive suite for the chairman, Irwin S. Chanin. This included an opulent bathroom tiled in cream, gold and green with a gold-plated sunburst over the geometrically engraved glass shower doors.

The Art Deco style influenced the interior design of office blocks and hotels throughout America. The Carew Tower, Cincinnati of 1931 by Walter W. Ahlschlager includes a resplendent Hall of Mirrors and Palm Court. However, by this date the influence of classic Art Deco, with its repeated, geometric forms, decorative ironwork and rich decoration was on the wane in America. It was gradually superseded by the Moderne, a combination of Art Deco and the Modern Movement which made an impact on the whole of the Western world through the Hollywood cinema and associated media during the 1930s and 1940s.

During the 1920s Art Deco was the dominant new style for Western European commercial buildings. After the 1925 Paris Exposition the style was linked with luxury and glamour, and with the world of Parisian haute-couture. Trent and Lewis's New Victoria Cinema in London (1929) features stepped, fan-shaped pillars, dramatised by concealed lighting to create an exotic ambience. London's Park Lane Hotel, built in 1927 by

Henry Tanner and decorated by Kenneth Anns, featured a graceful Art Deco ironwork mural in the foyer, complemented by silver painted furniture. Claridge's Hotel, also in London, was refurbished in 1930 by Oswald Milne using key aspects of the Art Deco style. The walls of the glamorous front entrance were painted primrose and the floor and steps were of Roman stone and Belgian black marble. The walls are punctuated by tall, gilded pillars, topped by illuminated fans. The ceiling is dominated by a chandelier which reflects in the blue and white mirrors, which are surmounted by stepped decoration. Extra decoration is added with delicate metal grilles, painted with cellulose gold. A burnished gold niche framed a sculpture of a deer against a tree by Milne, placed on a Lalique glass stand.

Such lavish design was rarely found in the domestic interior. It was only the very wealthy client who could afford such extravagance, particularly during the economic depression of the 1930s. Those who could afford to create a special Art Deco interior would commission interior decorators to execute the task. One example of this is the wealthy Dutch banker, David Van Buuren, who designed his own house in Brussels which was completed in 1928. After visiting the Paris Exposition in 1925 Van Buuren employed the Parisian decorating firm of Studio Dominique to decorate his living room. Dominique had been founded in 1922 by André Domin and Marcel Genevrière with a showroom at 104 Faubourg St. Honoré and executed work in Paris and Havana. The Van Buuren house features Dufy carpets, Lalique lighting and a specially designed black Canadian fireplace. (The house is now a museum open to the public on Monday afternoons.)

Outside France, the highly decorative and expensive style of Art Deco was usually seen only in specially commissioned cinemas, hotels and office blocks. It only reached a wider audience when it was combined with the simplicity of modern design in a style known as Moderne. This style was simpler and more chic and gradually supplanted Art Deco as the dominant influence on interior design in many parts of Europe and America. A commercial version that still had strong overtones of Art Deco gained mass popularity in the mid-1930s in Britain, where manufacturers and consumers had previously proved quite resistant to the appeal of Parisian ideas. The typical, modest-sized, semi-detached suburban home of the inter-war period often combined a Tudor Revival half-timbered exterior with lively Art Deco motifs on furnishings and interior details. These included rising suns which figured particularly in window-glass, mirrors and radio cabinets, and brightly coloured, geometric jazz patterns which were a favourite in wallpapers, carpets and upholstery fabrics, and tableware. The rare and exotic finishes characteristic of French Art Deco were replaced by mass-produced, modern materials. Popular furnishings included chunky or rounded sofas and matching armchairs covered with leather, velveteen or moquette, stepped, veneered cabinets and bookshelves, and geometric, coloured glass light-fittings. Such furnishings remained fashionable within middle-income sitting rooms until the outbreak of World War II and the introduction of rationing curtailed production within most areas of the home decorating industries.

Art Furnishings

The term “Art”, applied to furniture and decoration, refers to a style of domestic furnishing developed in Britain and America between the late 1860s and the mid-1880s. First coined by the critic Charles Locke Eastlake in 1867, the phrase Art Furniture initially referred to work that was architect- or artist-designed and that also involved a strong element of craftsmanship. Such pieces were therefore originally quite exclusive and expensive. Inevitably, though, these early associations lapsed and by the 1880s the word “Art” was being applied almost indiscriminately to wallpapers, ceramics and textiles, as well as furniture, to describe work that was not markedly different from that being produced by ordinary manufacturers at the time. In this sense Art Furnishings can be understood as both a continuation of and a commercial response to the reforms initiated by mid- and late-Victorian critics of architecture and design. Indeed, Art Furnishings have often been described as the first interior decoration style to reflect middle-class, as opposed to aristocratic taste, and their emergence coincided with the rise of the professional interior decorator and the increasing involvement of middle-class women as arbiters of taste and practitioners of design.

Stylistically, Art furnishings and decorations drew upon many sources. In the early phase elements derived from the reformed Gothic and Aesthetic styles, Japanese export goods, Islamic art, and European ornament in all its varieties were among the most important. Later, other features, notably those based on 18th-century English furniture, became more fashionable. But the central concern of Art Furnishings in both Britain and America was the demonstrable exercise of taste and it was perhaps this, rather than any purely stylistic feature that defined the phenomenon most clearly. Mainstream mid- and late-19th century styles of design were concerned above all with conspicuous consumption. Art Furnishings, on the other hand, appeared to reject such attitudes as vulgar and to value sensibility more than extravagance. In this respect, the emergence of Art Furnishings was closely linked to ideas popularised by Aestheticism whose most committed adherents not only decried the ugliness and ostentation of most manufactured goods but who likewise extolled the virtues of individuality over conformity and set great store by the exercise of an informed personal taste. For them, objects were to be appreciated not so much for their cost or status as for their intrinsic beauty, and the important thing was for the designer or consumer to be able to select from different periods or cultures judiciously and to combine the disparate elements harmoniously so as to create a coherent and beautiful whole. A similar outlook informed the production of Art Furnishings, many of which were actually used in Aesthetic homes and the purchase of which afforded visible proof of their owners’ discrimination and taste.

The rise of Aestheticism in Britain, and with it a new emphasis upon the need for Art within the home, has been attributed to several factors, including the increasing acceptance of the design reforms set in motion in the 1840s, the influence of the writings of John Ruskin, the example of the many new public buildings and interiors then being constructed according to “reformed” Gothic principles, and the display of innovative design at the many national and inter-

national exhibitions held during the 1850s and later. Attention has also been paid to the effects of changing social and cultural values, and to the significance of increasingly liberal and anti-industrial tendencies among the country’s professional and intellectual elite, in promoting an interest in art and beauty within the home. But perhaps of most importance within this context was the impact of the work of a small group of progressive architects and artist-designers and the growing appreciation of Japanese-inspired art and design.

Japanese goods were first exhibited in London at the International Exhibition of 1862 and were soon available from a number of retailers in the capital, notably Farmer & Rogers Oriental Warehouse, run by the young Arthur Liberty. Anglo-Japanese versions of the Oriental style were developed by designers such as Thomas Jeckyll, Christopher Dresser and E.W. Godwin during the late 1860s. A new freedom in the use of European ornament was demonstrated by Morris, Marshall, Faulkner & Co., both at the 1862 exhibition and in their prestigious commissions for the decoration of St. James’s Palace and the Green Dining Room at the South Kensington Museum in 1866. Philip Webb’s design for the latter was particularly significant, blending Gothic, Renaissance and modern elements into a scheme of subdued Pre-Raphaelite richness much more suitable for domestic applications than the ponderous Gothic then in vogue. Another distinctly artistic interior dating from the mid-1860s was D.G. Rossetti’s house in Cheyne Walk, Chelsea. Rossetti decorated the interiors of his home with an informal and exotic mixture of objects from different periods which illustrated the value of antique furniture and carpets in producing rooms with an Aesthetic ambience. Underpinning these innovations and developments was the bedrock of reformist ideals espoused in the 1850s by the Government Schools of Design which gave a semblance of uniformity and order to the seemingly endless combinations of decorative design favoured by contemporary designers and manufacturers.

Publications played an important role in relaying these developments to a wider public, and two books, both written in the late 1860s were especially significant: *Gothic Forms Applied to Furniture, Metal Work and Decoration* by Bruce Talbert of 1868, and Charles Locke Eastlake’s *Hints on Household Taste*, 1868. Talbert’s book was aimed at the trade and proposed an architectonic style of furniture, termed Modern Gothic, which referred freely to Gothic within bold rectilinear designs. *Gothic Forms* brought this style to the attention of consumers on both sides of the Atlantic and his work was widely plagiarised although the principles which underlay it were not always understood: Talbert himself, for example, recommended simple materials with painted or incised surface decoration but cabinet-makers often interpreted these ornaments as inlay and veneer, a practice exemplified by the sideboard produced to his design by Holland & Sons for the Paris Exposition Universelle of 1867.

Hints on Household Taste fulfilled much the same function as *Gothic Forms* but its influence was immeasurably greater. The book was reprinted four times between 1868 and 1872 and it can justifiably be considered the single biggest influence on Art Furnishing. Declining to recommend any particular style, Eastlake distilled the ideas of the South Kensington Schools, the Gothic Revival architects and William Morris into a single philosophy of interior design, stressing the virtues of

Art Furnishings advertised by Henry Capel, London, late 1880s

simplicity, flat pattern and rectilinear forms. He addressed his ideas directly to the householder and was highly critical of professional decorators whom he accused of “the absurd love of change”. His aim was to produce an environment that suggested continuity with the past in generalised terms and that stressed notions of simplicity, domesticity and homeliness.

There is little evidence of a commercial response to the above developments before the mid-1870s. Indeed the emphasis on amateurism and individual taste in *Hints* would seem to have precluded such initiatives. But from the mid-1870s the market for Art Furnishings was opened up in several ways. First, journals such as *The Builder*, the *Building News* and the *Art Journal* began discussing and illustrating new designs and, in so doing, stimulated wider demand for the style. Second, a steady stream of books and decorating manuals, mostly written by enthusiastic amateurs such as W.J. Loftie, Mrs. Orrinsmith and Mrs. Haweis, raised public consciousness about the importance of interior design. These publications were aimed at the professional middle classes and were supplemented by journals such as the *House Beautiful* in 1877 and *Decoration* in 1880. Third, a significant role was also played by London cabinet-makers like Gillows, Holland & Sons and William Watt, all of whom constructed suites of furniture for fashionable architects and later sold the same designs commercially. Watt’s catalogue of 1877 featured many of Godwin’s Anglo-Japanese designs while other firms in London and the provinces produced furniture more or less identical to that illustrated in Eastlake’s *Hints*. Suitably artistic wallpapers and textiles also became more widely available during the 1870s. Morris & Co. increasingly concentrated their efforts in this area, firms like the wallpaper manufacturers Cowtan’s imported Japanese embossed leather hangings, and retail outlets such as Liberty’s, founded by Arthur Liberty in 1875, supplied imported Indian and Far Eastern textiles for the “Art” market.

Those consumers who did not wish to purchase their Art Furnishings from these specialist suppliers could patronise established decorators who soon began to supply versions of the style in pre-digested form. Many of the well-known metropolitan firms, including Jackson & Graham, Collinson and Lock, T. Knight & Sons, and James Shoolbred & Co., offered commercial variations of this taste. Shoolbred’s, in particular, specialised in Art Furnishings and published an extensive catalogue in 1876 illustrating papers, furniture and suggestions for complete decorative schemes that has since become a standard sourcebook on the subject. Their designs came in a range of styles including the Anglo-Japanese, Modern Gothic and Renaissance, and although several bear a close resemblance to work produced by Godwin and the architect-designer T.E. Collcutt, they were produced in-house by Owen Davis utilising cheaper materials and machine-production techniques.

Despite their stylistic eclecticism, interiors furnished with Art Furnishings in Britain and America shared certain distinctive characteristics. As a general rule, the furniture was ebonised and gilded, lightly upholstered and displayed some evidence of revealed construction. Suites of matched furniture remained popular in dining rooms and bedrooms but there was a new move towards furnishing parlours, studies and smoking rooms with individual pieces in a variety of styles and towards mixing antique and modern furniture within the same scheme.

Tastemakers also recommended a reduction in the density of decorative objects used within the interior, but the proliferation of “artistic” ceramics, metalwork and textiles produced by the Art Furnishings industry soon confounded their efforts. In fact, the quantity of objects to be found in “artistic” interiors was often identical to that in less fashionable rooms but their appearance, quality and distribution were significantly different. Art ceramics, for example, tended to be simple in shape, with decoration derived from Medieval, Renaissance and Islamic prototypes, and they were no longer arranged in picturesque groups on tables and case furniture, but were placed whenever possible on the shelves or brackets of overmantles and cabinets that were designed specifically for that purpose. The Aesthetic Movement’s emphasis upon the importance of the contemplation of beauty also encouraged the isolated display of single objects such as paintings, sculptures or exotic curios, although how often the contents of the Art Furnished interior were subjected to the intense and self-conscious scrutiny suggested by their arrangement is open to question. And finally, the artistic interior was often flagged by totemic objects such as Japanese fans, Morris & Co. *Sussex* chairs, peacock feathers and oriental blue and white china – all widely lampooned in satirical journals like *Punch*.

The treatment of the architectural shell of these rooms also obeyed general principles. Architectural woodwork was usually quite conventional in form but was often painted in the same colours as furniture. Deeply moulded ceilings were frequently illustrated in the catalogues of professional furnishers, and the decoration of both ceilings and walls was given a new importance. Walls were generally divided into three horizontal bands – dado, fill and frieze – each given a separate decorative treatment that might include painted decoration, wallpaper and panelling. Ceramic tiles, either in panels or as continuous dados, were recommended in the catalogues of several decorating firms, but were generally expensive and were not widely used. Tertiary colour schemes, offset with gold, were common, and in time decorations became somewhat lighter in tone although white rooms were not widely accepted until the very end of the century. Several of these features survive in the interiors at 18 Stafford Terrace, Kensington, decorated some time after 1874 by its occupant, the political cartoonist Linley Sambourne. The furniture is a typical mixture of Talbert-style tables, sideboards and chairs, and genuine and reproduction Louis XVI antiques, while the decorations include generous use of embossed and gilded Japanese leather papers and Morris & Co. patterns.

The emergence of the Queen Anne style of domestic architecture led to a shift of emphasis within Art Furnishing. By the early 1880s, English 18th century styles – from George II to Robert Adam – had begun to replace Renaissance and Japanese styles as the favoured mode of furnishing. Colour schemes were generally lighter and brighter than in the 1870s and the elimination of cluttered surfaces was also carried further. Fitted furniture, inspired by 18th-century prototypes, was introduced both as a means of cutting down on the amount of dirt and dust within interiors and in order to open out the interior space. Increasingly Art Furnishings became more straightforwardly historicist and by the late 1890s, the original notions of simplicity and informality survived only as an ideal.

The introduction of Art Furnishings within North America occurred slightly later than in Britain but, initially at least, it developed along similar lines. Once again, Eastlake's ideas were extremely influential: *Hints* was published in Boston in 1872 and was widely available throughout the 1870s. Indeed, early American Art Furniture in the Modern Gothic manner was known as the "Eastlake Style", a term that Eastlake himself greatly disliked. Talbert's work was almost as popular, influencing among others the New York Art furnishers, Kimbel and Cabus, and the Philadelphia cabinet-maker Daniel Pabst. Pabst collaborated with the architect Frank Furness on Gothic furniture for several New York mansions, notably that of John Bond Trevor in Yonkers. But the key event in the popularisation of Art Furnishing in America was the Philadelphia Centennial Exposition of 1876. Several native firms showed furniture strongly influenced by Eastlake, and Collinson & Lock exhibited a number of Anglo-Japanese designs by Godwin, heralding the launch of Aesthetic styles within the avant-garde.

Despite the cultural and social hegemony of the East Coast, other centres of artistic activity emerged in the Midwest. Cincinnati was particularly rich in cabinet-makers and designers and a unique school of Aesthetic woodcarving developed at the Cincinnati School of Design under the instruction of Henry Linley Fry and Benn Pitman. Much of the best work was produced by women. Adelaide Nourse (later Pitman's second wife) and Emma Belper were both prominent in this field, and the work of 65 women carvers was exhibited by the Cincinnati School of Design at the Philadelphia Centennial.

Even more than in Britain, nostalgia played a leading role in American Aestheticism. The Centennial celebrations confirmed a growing interest in the nation's past and stimulated a taste for 18th-century Colonial furnishings. Clarence Cook, author of the influential *House Beautiful* of 1878, defended the liking for antiques on functional as well as aesthetic grounds. However, as in Britain, the desire to own old things reflected social anxieties more than practical considerations, and ownership of American antiques, in particular, was proof either of the family pedigree, or of aesthetic refinement in being able to pick out the object of quality from among the flotsam of second-hand furniture. With genuine antiques in limited supply, the fashion for reproduction furniture in 18th-century styles, known as the Colonial Revival, flourished and retailers like Sypher & Co. of New York responded quickly with advertising aimed at the Art market.

Art Furnishing has many claims to be the first "modern" form of interior design. Its appeal to middle-class taste, the new importance attached to named designers and retailers, and the network of publications and journals which evolved to inform the public about new developments all foreshadow the character of the market in the 20th century. But perhaps its most remarkable and enduring achievement was in the sphere of education, for within a few short years, a large section of the middle-class public were led to appreciate concepts of design quite alien to the understanding of the previous generation.

Art Nouveau

"Art Nouveau" is the generic term for a broad movement of style and ideas that embraced architecture, all the decorative and graphic arts, fashion, furniture and fittings right across Europe (and to a lesser extent, North America) in the years between 1880 and 1910. Art Nouveau is usually recognised by a distinct curvilinear quality, varying between subtle undulations of shape and an extravagant fantasy. It has a characteristic iconography of motifs and symbols abstracted from vegetation, and a repertoire of biomorphic forms; much of its imagery is directly or obliquely feminine. In a number of important cases this curvilinear and botanical stage was succeeded by a more geometrical manner, becoming something much closer to Modernism. If Art Nouveau is defined on formalist criteria it will probably be confined to the earlier manifestations associated with Brussels and Paris; but if it is regarded as a matter of taste and ideas, then a broader interpretation must be followed. The "broad movement" was also subject to a range of local or national variants, and an argument can be made that would advance the idea of a plural *Arts Nouveaux*. However the unity of a broad movement is not determined by formal characteristics alone, but by ideological, social and cultural use.

Historiographically, Art Nouveau has usually been treated as an intermediate phase, between the historicism of the 19th century and the Modernism of the 20th. But this story assumes

that there is a simple single-line development from one stage to another, and is inadequate in both fact and theory. Today it seems best to consider Art Nouveau in its own terms, as an array of objects, interiors and buildings (etc.) to which a set of criteria can be addressed. These criteria concern the relations with history, technology, social significance, artistic means, formal vocabulary and clientele. No particular instance is likely to meet all the questions asked of it, but in the process of asking, a field of meanings is created. It is necessary to explore these meanings rather than define the objects.

This approach is especially appropriate to the study of interiors, which are not objects, but ensembles only gaining their full meaning when they are in use. Rooms are the spaces that make a range of human meetings possible; they both contain and help to form human behaviour. To investigate the Art Nouveau interior is also to explore a social moment. It is additionally appropriate because the creation of a harmonious ensemble, in which every feature is integrated with the next, was a deliberate and oft-repeated aim of this otherwise varied tendency. At its most complete, this integration began to abolish traditional distinctions between fine and applied arts, and between craft and industrial objects in favour of an intricate synthesis of all aspects of design. It passed over into the clothes and deportment of the men and women who used the rooms, and it was held to signify a new stage in social life. Hence the very names by which this domain came to be known – the “new art”, “l’art nouveau”, “Jugendstil”, “Modernism”, “Arte Joven” etc. The style is also associated with particular cities – including in addition to Paris, Brussels and Vienna, Glasgow, Budapest, Darmstadt, Munich, Barcelona, Turin, and Chicago – several of which underwent rapid growth in the 1890s and sought to establish their distinct modern character.

In what did this newness consist and what did it mean? It was partly an outcome of the demand, insistent throughout 19th-century Europe, for a new style of architecture appropriate to an industrial epoch and linked to a new building technology. In England, this demand went back to the year of the Crystal Palace (1851) and beyond. In that context, M.D. Wyatt could ask English architecture for “a vocabulary of its own, in which to speak to the world the language of [England’s] power, and its freedom of thought and feeling.” New methods of building were envisaged, such as W.V. Pickett’s *New System of Architecture* (1845) which would be polychrome, curvilinear, prefabricated and distributed across the whole globe. The use of cast and wrought iron, later combined with steel joists and reinforced concrete, enabled architects to create interior spaces of great volume and delicacy. Ceramic and similar materials were developed which encouraged architects to treat the decoration of surfaces with a new freedom, independent of the underlying construction. Characteristic materials were terracotta, faience, artificial stone and enamelled iron – all capable of being used in strong or original colour. In this respect, Art Nouveau involved a reassessment of the relations between structure and decoration, with consequences for interiors as well as exteriors.

Art Nouveau was also related to developments in service technology. Throughout the later 19th century (at different rates in different places) oil lamps were replaced by gas lamps, mantels and flues were improved to get rid of greasy deposits,

and finally electric light promised perfect cleanliness. Heating and ventilation were combined through the use of ducts, fans and extractors; steam central heating became common in the more expensive houses and apartments. Effective plumbing, with running hot water and flush toilets became widely available. Much of this technology originated in ship and railway design but was incorporated into domestic and other buildings during the 1890s. This vast improvement in services did not cause Art Nouveau, but it gave it occasion; both in the small example of lighting fixtures, and in the grand case of the Paris Metro. The workshops and showrooms of Vienna’s Wiener Werkstätte (1903), for example, had electric lamps, washing facilities and water closets (*englische toiletten*) of such modernity that “many of those employed there ... found things so unfamiliar to begin with that they became a little shy, and none certainly had ever worked under such excellent conditions before” (Schweiger, 1984). Patrick Geddes, the Scots polymath, defined this in 1898 as the advent of the “neo-technic order” that would replace noisy and dirty “palaeotechnology” with “electricity, hygiene and art”.

The new art was also an outcome of the re-evaluation of craft values in the face of industrial production. Though it was in many respects a repudiation of the Arts and Crafts Movement, it is very hard to imagine Art Nouveau without its predecessor. Some Art Nouveau craft work of the 1890s is of exceptional virtuosity – for example, the glass bowls and vases of Emile Gallé (1846–1904) – and this virtuosity is at the very opposite end of the scale of values from the homely qualities that the Arts and Crafts Movement promoted. Yet the latter Movement, as it developed in the course of the century, produced branches which are hardly to be distinguished from Art Nouveau. This is especially the case in England, where the Aesthetic Movement produced objects and interiors that all authorities agree are an important stage in the creation of the “new art”. A very good example is the case of A.H. Mackmurdo (1851–1942), whose furniture and surface pattern work evinces Art Nouveau qualities, and whose writings advocate typical ideas and values.

Probably the most important debt that Art Nouveau owed to the Arts and Crafts Movements was the high value placed upon ordinary objects, and upon the necessity of seeking a synthesis between the useful and the beautiful. In particular, one can point to the ever greater significance attributed to decoration and the interior in English-language theory and criticism, all the way through from Pugin and Ruskin to Morris and Voysey. Where Art Nouveau differed from the Arts and Crafts Movement most strongly, was in social theory. The new style was openly progressive and anti-traditional, and developed no critique of capitalist modes of production and the division of labour, except in Belgium, in the pages of the journal *L’Art Moderne*.

The new style was also ideational. Though the precise signification of Art Nouveau varied according to country and context, it was always underpinned by a deep shift in philosophical, and therefore aesthetic, thought. This entailed a rejection of Positivism and a reassessment of intuitive and subjective modes of perception and knowledge. The language of Art Nouveau theory and criticism is often infused with vitalist descriptions of energy and life-force. This was enmeshed with what one writer has described as “the sense of the demise

of an old society, coupled with an agonizing uncertainty as to what the form of the new society might prove to be ... The result was an enormous heightening of self-consciousness ... as a counterbalance to the positivist faith in exact science, a number of the young thinkers of the 1890s proposed to rely on 'intuition' (H.S. Hughes, *Consciousness and Society: The Reorientation of European Social Thought, 1890-1930*, 1979). Mackmurdo summed this up as "a strong advocacy of subjective art in all its branches ... giving our work a more abstract or mood-made character, than the more popular forms of art possess ... at all times quite consciously selective ... the exponent of sentiment whose immediate source lies in qualities rather than things" (*The Hobby Horse*, 1, 1883).

There is no direct road from the pages of a thesis to the design of a living room, but it is clear that this reassessment led to the rejection of Naturalism – although not nature – both in literature and in painting, and to a burgeoning interest in symbolic and abstract forms of expression. There are many areas of overlapping activity and theory between Art Nouveau and the Symbolist movement in painting. The decorative values of the visual arts were seen to be more significant than the narrative; the paradigm of expression was, above all, musical. The consequences of this for painting were profound, leading in time toward the development of non-figurative art; but they also led to a higher valuation of what had hitherto been regarded as merely decorative – wallpapers, textiles, tile patterns all took on greater signifying power. There is a convergence between what William Morris had earlier called the "greater" and the "lesser arts of life". The consequences for interior design were profound; a room might be called on to do the work hitherto deemed proper for fine arts. It should strive to "materialise the outward forms of my sensibilities" as Maurice Barrès wrote, in his *Culte de Moi* (1889).

Musical analogies form a major theme in art-theoretical and critical writing of the period, as do organic analogies. Musical composition provided an important model of synthetic unity and complete organisation, an idea that received philosophical support in the writings of Schopenhauer, and artistic validation in the writings and practice of Richard Wagner. Many examples could be cited; the treatment of melodic line in Wagner's *Tristan und Isolde* is strikingly suggestive of the sinuous wandering lines of Art Nouveau; and Debussy certainly made comparison between melodic "arabesque" and the principles of decoration. In English, the most significant statement of these beliefs will be found in Walter Pater's much quoted sentence, "In [music's] consummate moments, the end is not distinct from the means, the form from the matter, the subject from the expression; they inhere in and completely saturate each other; and to it, therefore, to the condition of its perfect moments, all the arts may be supposed constantly to tend and aspire" (*The Renaissance*, 1873). And a project such as the unbuilt Music Room for the "House for an Art Lover" (1901) by Charles Rennie Mackintosh (1868-1928) needs to be interpreted in terms of these analogies.

Mackintosh's drawings for this room also demonstrate to the highest degree that synthesis of all the parts which was the aim of Art Nouveau. The panels beside the fireplace were to have been by Margaret Macdonald, almost certainly in creamy white gesso with small touches of colour. The same creamy white would have extended to the white lacquered furniture

Art Nouveau: *Cromer Bird* block-printed cotton by A.H. Mackmurdo for the Century Guild, c.1884

and the decorative pillars. The bud-like motifs would have shown an inner purple red or dull pink, and the carpet would probably have been a light beige or silvery green: the lamp shades copper with coloured glass inserts, and the fire-irons plain polished metal. The panels in the window bays are probably embroidered on linen to designs by Macdonald. The Music Room was one of the typical sites of Art Nouveau interior decor.

The life sciences also provided analogies for the designer. With the growing rejection of historicism went a crisis in decoration; traditional motifs, patterns and ornament were felt to have no further meaning. The search for a new decorative style entailed a return to Nature, not as visual appearance, but as hidden structure. "The value to a designer of a scientific comprehension of the world is the insight it gives him into the possible variations of the original, and the inexhaustible sources of grace and beauty; whence so much that is new, and yet consistent, may be derived..." (Edward Forbes, 1851). The study of botany for ornamental purposes – known as Art Botany – became a major part of the drawing curriculum in British and some Continental schools of design, from the 1860s onward. Important pioneers of the new style, such as Christopher Dresser (1834-1904) and A.H. Mackmurdo had a scientific education. Among architects, Victor Horta, Antoni Gaudí, and H.P. Berlage are known to have had an informed interest in the life sciences. Books of scientific illustrations, such as Ernst Haeckel's *Kunstformen der Natur* (1899-1904)

were in many studios, and the biomorphic element in Art Nouveau certainly derives in large measure from these sources. This is particularly true in domestic glassware, where the material lends itself to fluid treatment, and is well seen in the work of Louis Comfort Tiffany (1848–1933). However, this was not universal; the tendency to an informal naturalism was always present in French Art Nouveau.

The stylistic origins of Art Nouveau were diverse and extensive, including Celtic, Viking, Javanese, and above all Japanese decoration. These sources provided alternative examples of highly intricate decoration, without the cultural authority of historical precedence. Japanese structural carpentry, too, had a bearing on the treatment of wood by E.W. Godwin, Charles Rennie Mackintosh and Frank Lloyd Wright. Local and peasant traditions, too, played a part in the deployment of Art Nouveau through Eastern Europe and Russia. These latter interests were not so much anti-historicist, as ahistorical, part of an assumed “natural” folk-culture which had hitherto been overlaid with aristocratic and imported styles. Thus the New Art could be linked in one direction to global and imperial references, and in another to local or vernacular traditions. In each case, the aim was to find cultural models alternative to the former lines of European tradition.

All these theoretical concerns impelled designers and artist / craftworkers toward a style that rejected historical precedents (unless they were ancient or exotic), sought for models in other artistic disciplines and in a new concept of Nature, and which could embody a heightened self-consciousness. The bringing together of these concerns with new technical opportunities required a synthesis that was both imaginative and practical.

Art Nouveau was, more than anything, concerned with synthesis. This meant, at one level, creating a unity of style – a correlation of parts so that each detail contained within itself the germ of the whole ensemble. H.P. Berlage (1856–1934) described this as “a mutual agreement in art principle” such that a chair might be described in terms of a small building, and a small building in terms of a chair. The mental model here is, essentially, biological correlation between large and small features, such that just as an animal might be reconstructed from a few bones and a footprint, so a house might be deduced from a door-handle, two chairs and a balustrade. Here scientific methods defined by comparative anatomy combine with the Wagnerian *gesamtkunstwerk*. At the next level, it meant a synthesis of process, so that art, craft and industrial methods could be employed side by side to the one purpose; this may be seen as an outcome of British debates about the correct uses of hand and machine processes. And at the third level, the synthesis was between the demands of function and beauty (which was also of the binary balances between intellect and emotion, reason and intuition). This was a further stage in the long-running discourse that placed structure in relation to decoration. In 19th-century symbolic terms the balance between intellect / reason / structure and emotion / intuition / decoration was between supposedly masculine and feminine forces. This synthesis could only take place to the full in rooms, where spaces, objects and manners interact. At this deep symbolic level, Art Nouveau was concerned with gender relations.

At the level of immediate practice was the willingness on the part of artists and craftspeople to cross boundaries. An excellent example of this is Henry van de Velde (1863–1957), a

painter who, having built and decorated his own house, designed his wife’s wardrobe (in both senses of the word), and then became a designer for both craft and industrial production, and a leading theorist. Mackintosh was simultaneously a designer of buildings, interiors, furniture, textiles, and every detail of the household; finally a painter of some note. Peter Behrens (1868–1940) was first active as a painter, then as a graphic designer, branching out into applied arts and domestic architecture, finally becoming a major industrial designer and builder of factories. These are only the most prominent examples of a general tendency. Where all these domains intersected was in the design of interiors.

Another important question that needs to be answered is at whom was Art Nouveau addressed? Robert Schmutzler, whose *Art Nouveau* is one of the most complete studies, argues that it is “a style of the upper bourgeoisie, that of the cultured and urbane middle class in the heyday of classical capitalism. It is essentially the first genuinely universal style of a period which was no longer under the domination of the clergy or aristocracy.” Conspicuous private consumption was certainly a feature of Art Nouveau commissions. The compact splendour of Josef Hoffmann’s Palais Stoclet, Brussels (1905–11), takes the breath away; exotic woods, marbles, mosaic, copper, enamel and gold leaf are brought together with consummate taste. The house competes with Antoni Gaudí’s Palacio Güell, Barcelona (1886–89), for the most expensive private commission of the epoch. But one should not assume that this social group was everywhere the same, or that it even had the same interests.

One persuasive analysis shows that in France the new art was perceived to be a modernisation of the Rococo in new conditions, a neo-conservative return to expensive craft values after the debacle of the Franco–Prussian war (Silverman 1989). This is particularly clear in the designs of Louis Majorelle (1859–1926), especially the series of restaurants he worked on between 1899 and 1905. The restaurant is another typical site for Art Nouveau, since it is a point where private and public worlds mingle in both fact and sentiment, and a restaurant is also a place for conspicuous consumption (in every sense of the word) and for the display of fashions. Majorelle’s interior of the Restaurant Lucas-Carton, in the Place de la Madeleine, Paris (1905) demonstrates the Rococo aspect of Parisian Art Nouveau to the full, showing a characteristic delight in naturalistic detail and refined but entirely traditional craftsmanship. It is also, clearly, a strongly gendered space, devoted to a certain notion of the feminine. But these, it might be said, are exactly the aspects of Art Nouveau that were not transferable to the new century, and which prevented French designers from evolving the style toward industrial production.

Silverman aligns French Art Nouveau with an ideological struggle taking place between the traditional and the New Woman. Government circles encouraged the growth of the new art and identified it with a modern domesticity that was antagonistic to the undomesticated and autonomous New Woman (whose ideological profile was perceived to be scientific, Positivist and anti-clerical). The effect of this campaign was “to define and promote women as the natural allies of French luxury craftsmanship, and as the artificers of a unitary interior design”. This is perfectly caught in some of the designs made by Georges de Feure and Eugène Gaillard and particularly in

de Feure's boudoir designed for Bing's L'Art Nouveau pavilion (1900). But this interpretation suggests a defensive conservatism which does not match easily with the ideology of Catalan Modernisme (which had nationalist overtones); nor with Glasgow's imperial rapacity and colossal industrial undertakings. In Austria-Hungary, the Secession was at least partly an attempt to create a modern identity for an ancient regime. In Chicago and New York yet further assertions were being made. And none of these alliances explain the uses of the style in the cause of progressive politics and early socialism. That it should serve for the posters of the Italian Socialist Party and the headquarters of the Belgian Union of Socialist Workers is not surprising, since Art Nouveau was often conceived in Utopian terms, as a union between art and industry in the service of the future. This is clearly demonstrated in the connections established between radical politics and the new art in Belgium where the Belgian Union of Socialist Workers, or *Maison du Peuple* as it was known, was built by Victor Horta between 1895 and 1898.

The *Maison du Peuple* contained offices, meeting rooms and a large conference hall. The same ornamental motifs extend from pavement to roofline, in stone, brick and rivetted iron; structural elements such as the iron pillars, girders and brackets are left exposed and function as ornament, both within and without. Every detail seems to have been completely thought through. The plan fits a complicated building into an irregular site with great skill; the interiors were as plain, but as considered, as this façade, thus showing that Art Nouveau should not be thought of as invariably opulent. The destruction of this building in 1966 now looks like a piece of official vandalism.

In the United States, the new art was understood in rather different terms. In New York, and particularly in the work of Tiffany, it fits well within the range of European culture; but as developed in Chicago, with such designers as Louis Sullivan (1856–1924) and Frank Lloyd Wright (1867–1959), it was promoted as a democratic and American antidote to European aristocratic values. But within this context, America represents the geographical and ideological edge of the “field of meanings”.

Elsewhere, the Art Nouveau style could be seen in popular commercial entertainment, in restaurants and tearooms, and in the major public services such as the Viennese tramway system, and most famously the entrances to the Paris Metro which were designed by Hector Guimard c.1900. As early as 1889 while a young teacher at the *Ecole des Arts Décoratifs*, Guimard had designed an exhibition pavilion called the *Pavillon d'Electricité*. Ten years later, a competition for new stations organised by the Metropolitan Company produced such poor entries that the committee turned to Guimard who had now a reputation as an ingenious and original architect. There followed a long battle with the municipal authorities who preferred academic architects; the new style was promoted by a new commercial / technical undertaking, in the teeth of older social forces. One contemporary journal wrote “His aim has been to avoid any ornamental motif borrowed directly from nature or, more specifically, flora. Here we shall find no decoration assuming the forms which exist in nature, neither flowers nor vegetation. M. Guimard is interested only in line; it is from the ‘line’ or from the arrangement of several

lines that he draws all his effects.” Guimard's entrances and balustrades perfectly illustrate the connection between abstract decorative draughtsmanship and industrial production typical of Art Nouveau; academic architecture has fallen through the gap in between them.

At its cheaper end, Art Nouveau is to be found in very ordinary urban situations. In the better terrace houses of Belfast, for example, one finds everywhere iron grates, mouldings, tiles, fireplaces and leaded windows with a “nouveau” character; the city enjoyed great prosperity in the early 1900s.

When we examine the uses of Art Nouveau, and look at its clientele and promotion, we begin to perceive why it was possible that such a tendency could be so widely disseminated and so characteristic of its period. All those groups looking toward the next century could align themselves around it, as iron filings align themselves round magnetic lines of force. Great wealth from the new industries, new technologies and building methods, liberal moral values, philosophical idealism, different feminisms, early socialist politics and new types of social relations based around all these, could find in Art Nouveau a focus of style and feeling, even while they might have nothing else in common. It is therefore most appropriate to think of Art Nouveau as the expression of a particular moment of modernity, in which a very wide coalition of interests and social groupings could, briefly, share. And it is possible to identify these around some contemporary activities.

The first of these activities is shopping. The growth of Art Nouveau coincides with the growth of department stores and specialised boutiques, and the style is frequently associated with particular names. Perhaps the most notable is Siegfried Bing's gallery L'Art Nouveau (established Paris, 1895) which commissioned or imported designs from Tiffany, van de Velde, Gallé, Lalique, Morris, Crane, Voysey and de Feure (as well as a host of others). But Liberty's (established London, 1875) is hardly less significant and gave the name of style liberty to Italian Art Nouveau. The *Magazin für Kunstgewerbe* (Vienna 1875) was under the direction of Henry van de Velde from 1899. Other important names are La Maison Moderne (established Paris, 1897), and the Wiener Werkstätte showrooms (established Vienna, 1903). On the larger scale, major stores such as the *Galerie Lafayette* (established 1900), and similar emporia had Art Nouveau furnishing departments. Many of these major stores were themselves designed by Art Nouveau architects, including Messel's Wertheim Store (Berlin 1896), Horta's L'Innovation (1901), and Frantz Jourdain's La Samaritaine store (Paris 1905).

But shopping, especially for women, is a social activity of some importance. Where women of the 1890s were concerned, shopping was their principal point of entry into a public domain comprised not only of shops, but also of streets, boulevards, parks, tearooms, cafes, restaurants and transportation. Each one of these sites was a location for the new art, in the forms of street furniture, benches, shelters, kiosks, façades, doorways, shopfittings and interiors. Art Nouveau stands as a marker of a commercial modernity, and of an aspect of modern public life which was “feminine”. A recent writer has remarked on “the invisibility of women in the literature of modernity”; but beyond literature, in the realm of things, a distinctly feminine domain was developed in and through Art Nouveau. Thus the style intersects with different aspects of

Art Nouveau: smoking room by Henry van de Velde for S. Bing's salon L'Art Nouveau, Paris, 1895

female emancipation and the discourse of femininity, and this discourse is deeply inscribed in its formal character, ambitions, promotion and marketing.

It does not now seem possible to reconstruct in detail the degree to which women were the direct buyers and commissioners of new designs. But it is clear that Art Nouveau was often addressed to women as if they were the principle customers. Further research might show non-architectural Art Nouveau to have been the first example of a style conceived in the modern terms of consumption and the buying power of women.

With consumption went publicity. Art Nouveau was deliberately promoted through illustrated art periodicals to an unprecedented degree. *L'Art Moderne* (Brussels 1881), *The Studio* (London 1893), *The Chap-Book* (Chicago 1894), *The*

Yellow Book (London 1894) *Pan* (Berlin 1895), *Die Jugend* (Munich 1896), *Art et Décoration* (Paris 1897), *Deutsche Kunst und Dekoration* (Darmstadt 1897), *Dekorative Kunst* (Munich 1897) *L'Art Décoratif* (Paris 1898), *Ver Sacrum* (Vienna 1898), *Mir Iskusstva* (St. Petersburg 1899), are merely some of the widely distributed publications. Many more can be cited; all were concerned with the "artistic interior". The Art Nouveau style was also seen on posters and advertisements; most famously by Henri de Toulouse-Lautrec (1864–1901), Jules Chéret (1836–1932) and Alphonse Mucha (1860–1939). Art Nouveau should, therefore, be considered under the heading of "spectacle". And here should be noted the increased range of graphic techniques available for every kind of publication, and the use made of them by such Art Nouveau illustrators as Aubrey Beardsley (1872–98) and his many followers.

And third, closely connected to both shopping and publicity, were exhibitions. The phenomenon of large Expositions is now recognised as a gauge of national and regional ideologies; they existed then, as now, to promote social and political positions through the display of goods. The new art was an element in the promotion of the modern polity, as well as being an element of trade. Among the many exhibitions large and small, the following are certainly significant. Les Salons du Champ de Mars (Paris, from 1891), a regular exhibition venue which gave equal prominence to both the fine and applied arts. The 7th International Art Exhibition (Munich 1897) treated the applied arts with the same attention as painting and sculpture. The Decorative Arts Exhibition (Dresden 1897), at which Bing's exhibits, mainly designed by van de Velde, received an enthusiastic response. The 8th Secession Exhibition (Vienna 1900), organised by Josef Hoffmann of the Wiener Werkstätte, which brought the work of English and Scots designers into contact with the Werkstätte; especially that of the Glasgow Four and C.R. Ashbee. L'Exposition Universelle (Paris 1900), notable for Bing's pavilion with complete interiors designed by Eugène Gaillard, and Georges de Feure; and for an extensive display organized by the Central Union of Decorative Arts, which included Hector Guimard, Louis Majorelle, Emile Gallé and others. This was also the year in which the Metro, with entrances designed by Guimard, was brought into full operation. The Glasgow International Exhibition 1901, notable for the exhibits of the firm Wylie and Lochhead, and for connections established with Russia. The Decorative Art Exhibition, Turin 1902, with pavilions designed by Raimondo D'Aronco (1857–1932) brought quantities of the new art to Italy, not least work from Glasgow. The exhibits were subsequently seen in central and eastern Europe, in other shows. Many others might be cited.

In each and every one of these exhibitions, real or imaginary interiors were displayed, often made especially for the occasion. A study of these exhibits is a study of the developing idea of the modern interior; and this idea gains its point of maximum velocity in the years of Art Nouveau.

Artari Family

Italian family of stuccoists

The Artari family included a number of celebrated stuccoists who were active in Germany and England in the second and third quarter of the 18th century. The family originated in Arogno in Italy in the late 16th century; its history is extremely complex and confusing. Primary sources often refer to individual members by their surname only and although research

undertaken by the historian Geoffrey Beard has gone some way towards clarifying certain important biographical details, there is still no catalogue defining the extent of each family member's work.

According to Beard, Giovanni Battista Artari was born in 1664 and married Caterina de Maini in 1688. His son, Carlo Giuseppe was born on 5 September 1692 and died on 27 May 1757. Another son, Adalbert, was born on 7 October 1693 and a record of the death of an Alberto Artari on 22 October 1751 may refer to this same Adalberto. There is also mention of another master called Giuseppe, the son of Domenico and Bartolomea Pianca, who was born on 20 September 1700. There is much to suggest that the stuccoist principally active in England was Carlo Giuseppe (1692–1757), and that it was the other Giuseppe (b.1700), perhaps a cousin of the former, who worked in Germany, especially since several sources record that a master with that name died in Cologne in 1769. Also, given the difficulties and time involved in foreign travel during this period, it seems unlikely that one master could have been active between 1729 and 1732 at Brühl and working contemporaneously in London (1729) and Essex (1730–31). Similarly, it is hard to believe that the same person who worked at the Pöppelsdorf Palace, near Bonn in 1744 was paid for work completed at Wimpole Hall and at the Radcliffe Camera in Oxford during the same period. Or that someone who was in Cologne between 1754 and 1757 was at the same time working in Warwickshire (1756–60). It seems altogether more plausible to suppose that after working with his father at Aquisgrana, Carlo Giuseppe settled in England while the younger Giuseppe continued to work in Germany developing his family's technical inheritance.

The earliest documented work by Giovanni Battista Artari is at Rastatt and is dated 1705. Giovanni's talent in rendering stucco with the same properties as marble is evident in the decorations executed for the Hofkirche in Rastatt, particularly in the Gloria of the Virgin on the high altar. He executed a large part of the sculptural work in the apse and chapels in Fulda Cathedral which was produced with Johann Neudecker the Elder in 1707. The extraordinary force of his work is apparent in the four colossal figures of the Fathers of the Church in the Monk's Choir. Following this he worked at Brühl and on the cupola decorations in Aquisgrana Cathedral (c.1720–30).

Adalberto Artari (b.1693) is probably the same Albert Artari active in 1724 with his brother, Joseph, at Sutton Scarsdale, Derbyshire, and at Ditchley in Oxfordshire. The Ditchley archives include a reference to a payment made for stucco executed by "two Mr. Artare".

Adalberto's elder brother Carlo Giuseppe enjoyed a considerable reputation in England and won the esteem of some of the most important English architects of the time. Between 1720 and 1724 he assisted another celebrated stuccoist, Giovanni (or Jacopo) Bagutti, on the sculptural decoration of the interiors of buildings designed by James Gibbs. These included the Octagon Room, Twickenham, the Church of St. Martin-in-the-Fields and the Church of St. Peter's in London, and the Senate, Cambridge. Their work consisted mainly of low-relief ornament executed in an elegant Rococo style. Carlo Giuseppe's activity in England is also documented in several payments made for work in various houses throughout the

country and in London, including Houghton Hall, Norfolk (1726), and Castle Hill, Devon (1742). In some cases he was also paid for designs that he did not execute himself; he received two pounds and two shillings for a drawing for finishing the Temple of the Four Winds at Castle Howard, Yorkshire, in stucco in 1736 but the work itself was carried out by another craftsman, Vassalli. Several Italian masters were working in England during this period, although Artari and Bagutti were the most important, and together they played a significant role in bringing delicacy and refinement to the austere, classical style of architects such as Gibbs and Colen Campbell. Their work also had a strong influence on the beginnings of the Dublin school of stuccoists.

Between 1748 and 1761, the Giuseppe Artari active in Germany executed stucco-work after Biarelli's designs at Schloss Augustusburg, near Cologne which included decoration in the first floor State Room. The works executed for the Elector of Cologne's Residenz have unfortunately been destroyed, so Giuseppe's most important extant undertakings in Germany remain the stucco decorations for François Cuvilliés' Falkenlust Hunting Lodge, Brühl (1729–32) and those for the Cuvilliés' Pöppelsdorf Palace. The Pöppelsdorf stuccoes were produced with Carlo Pietro Morsegno and the Castelli brothers from 1744. The ceiling of the billiard room is especially noteworthy, as are the figures in the round on the chapel's altar and the frieze of the spire on the guards' hut in front of the palace. Giuseppe's extraordinary capacity for invention and virtuosity when handling refined Rococo themes is exemplified in these sculptural decorations.

Biography

The Artari (Artaria, Artario) family settled at Arogno near Lugano in the Ticino in the late 16th century. All three of the most important members of the family, Giovanni Battista, Adalberto, and Carlo Giuseppe were active in England. Giuseppe Artari (b. 1700) was probably the family member active in Germany.

Artari, Giovanni Battista 1664–after 1730

Born in Arogno. The father of Adalberto and Carlo Giuseppe. Recorded at the Hofkirche, Rastatt, 1705, at Fulda Cathedral in 1707 together with G.B. Genone, and at Aquisgrana Cathedral, c.1720–30. Most of his career was spent in Northern Germany, the Netherlands and England. Married Caterina di Maini in 1688.

Artari, Adalberto (Adalbertus, Alberto) 1693–1751

Born in Arogno, 7 October 1693. Only his English career is known, where he worked with a brother, Joseph. Died 22 October 1751.

|------|--|
| 1724 | Sutton Scarsdale, Derbyshire (stucco decoration) |
| 1725 | Ditchley, Oxfordshire (stucco decoration) |

Artari, Carlo Giuseppe 1692–1757

Born in Arogno, 5 September 1692. Trained with his father, Giovanni Battista. Worked in Rome, Germany and Holland, before travelling to England c.1715. Worked on church decoration in London, at St Peter's, Vere Street, 1723–24, and at St Martin-in-the-Fields, 1722–26. Collaborated frequently with Giovanni Bagutti (1681–after

Carlo Giuseppe Artari: Octagon Room, Orleans House, Twickenham, Middlesex, 1720

1730) on country house interiors, and worked independently on the stucco decoration for several others from the 1720s; provided the unexecuted plans for a Temple of the Four Winds at Castle Howard, Yorkshire, 1736. Married to a Mary Gertrude. Died 27 May 1757.

Selected Works

- c.1715 Duncombe Park, Yorkshire (stucco decoration)
- 1717–33 Clandon Park, Surrey (stucco ceiling in hall): 2nd Lord Onslow
- 1720 Octagon Room, Twickenham (stucco decoration)
- 1722–30 Senate House, Cambridge (stucco ceiling)
- 1725 Ditchley, Oxfordshire (saloon ceiling): George Henry Lee, 2nd Earl of Lichfield
- 1726 Houghton Hall, Norfolk (ceiling and frieze of Stone Hall): Sir Robert Walpole
- 1729–32 Cavendish Square, London (stucco decoration)
- 1730–31 Moulsham Hall, Essex (stucco ceiling of Great Room, stucco busts and figures)
- 1735 Parlington Hall, Yorkshire (stucco decoration in drawing room, hall, and staircase)
- 1737 Upton House, Banbury (stucco ceiling, statue of Apollo)
- 1737–38 Trentham, Staffordshire (stucco decoration in New Library)
- 1742 Castle Hill, Devon (stucco decoration, bas reliefs in Best Hall)
- 1743–44 Wimpole Hall, Cambridgeshire (stucco decoration)
- 1744–45 Radcliffe Camera, Oxford (stucco decoration)
- 1756–60 Ragley Hall, Warwickshire (stucco decoration in Great Hall): Lord Conway

Works attributed to Giuseppe Artari (b.1700)

- 1729–32 Hunting Lodge, Schloss Falkenlust, Brühl (stucco decoration): Clemens August, Elector of Cologne
- 1743–44 Pöppelsdorf Palace, Bonn (stucco decoration): Clemens August, Elector of Cologne
- 1748–61 Schloss Augustusburg, Brühl (stucco decoration in State Rooms and staircase figures): Clemens August, Elector of Cologne
- 1754–57 Erbdrostenhof (stucco decoration): Clemens August, Elector of Cologne

Artists' Houses

Purpose-built artists' houses, designed by architects and incorporating the studio as a central feature within the structure of the house, were a distinctive feature of the art capitals of Europe and America in the later 19th century. Built at a time when it was not exceptional to find artists enjoying large incomes and social acclaim, these houses, sometimes called "studio houses", were often richly decorated in the fashionable tastes of the day.

A "studio" is by definition the place of work for an artist. In all periods an artist-craftsman would require both space and light, as well as further rooms for the storage and for the preparation of materials. The artists' "workshop" – in the classical writings of Vitruvius and Pliny the word *officina* was used – itself might also serve as a saleroom, if only in the sense that a patron or agent might come to observe a commission in progress.

The requirement for good steady light was particularly noted by the 1st century engineer Vitruvius in Book VI, chapter V of *De Architectura*. Vitruvius wrote of the importance of siting "picture galleries, embroiderers' workrooms and painters' studios [to the north] in order that the fixed light may permit the colours used in their work to last with qualities unchanged". Leonardo da Vinci also wrote that "Light should always come from the north, in order that it may not vary".

The artists' workshop or studio was also traditionally a place in which to make preparatory studies and a place of training for apprentices in the skills of a particular art trade. With the revival of interest in classical art during the 15th and 16th centuries, the study and imitation of antique sculpture became a central activity of the artist's studio. Vasari (1511–74) in his *Vite* (1550) referred to Francesco Squarcione, the master and adoptive father of Andrea Mantegna, having a collection of fragments and casts for the education of his gifted pupil.

During the Renaissance period the studio was a workshop and it differed little from other artisan workshops of the commercial quarters of cities. Some artists did own houses of substance; Vasari refers to a number of these which were designed by the artists themselves, such as that of Mantegna in Mantua. Vasari's own house in Arezzo survives with *trompe-l'oeil* architectural detail, decorative allegorical wall paintings and fashionable grotesque work carried out by the artist himself, perhaps both as a demonstration of his skill and imagination, and as proof of his comfortable status.

While the artistic elite of Europe in the succeeding centuries strove to maintain the intellectual image of the artist created by Vasari, the studio itself remained essentially the functional workroom. Indeed throughout the 18th century the painting rooms of distinguished painters were mostly built on as additions to their houses – with galleries for the combined display

Artists' Houses: Lord Leighton's studio London, 1890s

and storage of their paintings. As to the content of such rooms, paintings of that date and inventories of artists' property show that the attributes of the studio remained in the academic tradition of the Italian old masters, containing casts or fragments of antique sculpture as well as copies of the works of the old masters.

From the mid-19th century there was a significant rise in the number of studio houses designed by architects for the combined domestic and professional requirement of artists. The increasingly elegantly appointed studio was no longer an afterthought but the central element in the design and planning of such houses – what William Gaunt called the “luxurious core” around which the houses were built.

In England, Philip Webb (1831–1915), the associate of the Pre-Raphaelite Brotherhood and architect of the Red House for William Morris, designed several houses with studios during the 1860s, including one in Holland Park for the painter Val Prinsep (1838–1904). Solidly built of simple red brick in the new vernacular style, their decoration also tended to reflect the prevailing Arts and Crafts taste of their patrons – De Morgan tiles, Morris and Co. papers and furniture.

One of the best known, and most exotic, studio houses of the mid-19th century was the house built by Frederic Leighton (1830–96), later President of the Royal Academy. Leighton's plain red brick Italianate villa was built adjacent to Prinsep's

house in Holland Park Road. It was designed in collaboration with the architect George Aitchison and the garden elevation was dominated by the studio window. The house was decorated throughout with ebonised woodwork, and turquoise blue De Morgan tiles lined the hall and the staircase walls. As Leighton became more successful and entertained more and more fashionably, he held receptions and musical recitals in his large studio with its terracotta coloured walls. Reflecting his travels in the Middle East and the taste for the exotic so evident in his paintings, in 1877–78 he added the domed Arab Hall. This was modelled on the reception hall of a Moorish Palace, La Zisa at Palermo, which Aitchison had drawn on a visit to Italy. The Arab Hall was decorated with Leighton's collection of 16th- and 17th-century Iznik and Syrian ceramic tiles.

A painter's subject interests were also often evident in the design sources for the studio house and its decoration at this date. The best example of this trend was the eccentric studio house in Hampstead belonging to one of Leighton's fellow Royal Academicians Lawrence Alma-Tadema (1836–1912). Tadema remodelled an older house in collaboration with the architect Alfred Calderon to create an essay in the Pompeian style that was highly appropriate for a painter famous for his classical subjects. His huge domed and vaulted studio had a ceiling lined with light-reflecting aluminium. The astonishing

impact of the interior was said to conjure up visions of "all the luxury, the ivory, the apes and peacocks of the Roman civilisation with which his art was largely pre-occupied".

The architect who designed many of the more distinguished studio houses for the establishment artists of the later 19th century in Hampstead and Kensington was Richard Norman Shaw, R.A. (1831–1912). The house he built for Marcus Stone (1840–1921) on Melbury Road (1875) in Kensington exemplified the skill with which Shaw resolved comfortable and elegant domestic accommodation with the space and light required for the studio. The house was designed in the red brick Queen Anne style with cut and moulded brick dressings and white painted woodwork. The first floor is almost entirely given over to the studio, with three enormous oriel windows overlooking the street. The huge studio was furnished with 18th-century furniture – some of which appeared as props in his popular genre paintings – tapestries, ceramics and oriental carpets, which together gave the room the appearance of a grand "Old English" reception room. The characteristically grand interiors of these Kensington studios were recorded in a series of posed portrait photographs of "Artists at Home" taken by J.P. Mayall and published by F.G. Stephens in London and New York in 1884.

Similarly splendid studio homes were also built and decorated by artists in Europe and America. The vast Paris studio belonging to the painter Benjamin Constant contained many exotic Arabian features including, according to a contemporary report, "a choice collection of Moorish rugs and curtains of all sorts ... [which] ... transformed the place into quite a suggestion of a portion of the Alhambra itself". The American painter Frederick Church's house, Olana, was decorated in an even more self-consciously Aesthetic style. Perched high on a dramatic hillside site with spectacular views of the Hudson River valley, Olana was an astonishing mélange of colour, texture and form. Designed by Calvert Vaux (1824–95), it was built under Church's supervision in the 1870s with a new wing added in 1888–90. The dominant influences were once again Near Eastern and the interiors contained floors festooned with oriental rugs which also served as portières, wide arched openings decorated with stylised mozarabic floral stencilling in the spandrels, and numerous examples of elaborately carved dark wood furniture and gleaming brass bowls and ornaments. Olana exemplified both the theatricality and the artistic eclecticism that characterised artists' houses in the late 19th century.

The sudden evolution of houses of such individuality and increasingly studied interior decoration, often the result of close collaboration between artist and architect, is a remarkable phenomenon. Mark Girouard has suggested a helpful formula for the part explanation of the rash of such houses – in London at least. First, painters were becoming more interested in working in natural light. Second, the belief in "honest construction" that was widespread among more progressive architects in the second half of the 19th century encouraged an expectation that the studio should be "expressed" in the planning and exterior of the building. And third, there was considerably more money in art production – as much through reproduction rights as from originals. Indeed Andrew Saint's study of Richard Norman Shaw (1976) includes the observation that the artists, rather than the bankers, "were the real *Nouveau riche*" of Shaw's clients.

Of course, many artists failed to achieve great commercial success and occupied less distinguished studios. Some of these were modest but respectable speculatively built studio houses or flats, others were country retreats. And there were also studios closer in reality to the romanticised image of the Parisian garret of Puccini's *La Bohème*. Nevertheless, the more ambitious or commercially successful artists of this time set great store by the design and decoration of their studio houses. These artists were essentially engaged in an advertisement: the demonstration (or suggestion) of their success and position, and cultivated individuality. As the critic A.L. Baldry observed in his biography of Hubert Herkomer in 1904: "House Building became a fashion that any rising artist with a balance at the bank could not resist. He felt that he must surround himself with visible evidences of the appreciation in which he was held or there would be a danger that the public, all too ready to judge by externals, would pass him by as a failure, and prefer to him some of his more demonstrative competitors." And Albert Wolff, the influential critic of *Le Figaro* wrote of the smart Paris studios in 1886: "in our epoch the painter is no longer the labouring artisan who locks himself away in his studio behind a closed door – living in a dream, he has thrust his head foremost into the bustle of the world ... he has his day when his studio is transformed into a salon where he receives the elite of polite society".

JEREMY MUSSON

Selected Collections

Several artists' houses and studios have been preserved as memorials to their owners' lives and careers. Notable examples include the Rubens House, Antwerp; Leighton House, London; Olana, Hudson River Valley, New York; and the Musée Gustave Moreau, Paris.

Arts and Crafts Movement

Originating in Britain in the second half of the 19th century, the Arts and Crafts Movement was a broadly-based style that encompassed architecture, furnishings and every aspect of domestic design and whose influence was widely felt throughout the industrialised world. Its central tenets were the championing of architecture and the decorative arts as equal in status to the higher arts of painting and sculpture, the celebration of handwork and the revival of obsolete craft skills, and a belief in the moral and aesthetic supremacy of simplicity, fitness for purpose and honesty to materials. Yet for many of its most committed exponents, the Arts and Crafts Movement was not merely a style; it was also expressive of a whole way of life. Born out of the anti-industrial feeling that gathered momentum from the mid-19th century, it reflected a pervasive longing for a return to the simplicity and harmony of a vanished rural past. In this sense the Movement had a strong political dimension and many of its concerns anticipated the Modern Movement's belief that artists and designers should become more socially responsible and should play a more active role in the improvement of society as a whole.

The Movement took its name from the Arts and Crafts Exhibition Society which was formed in London in 1888 by Walter Crane, W. A. S. Benson, George Clausen, Holman Hunt, and T. J. Cobden-Sanderson. Many of its ideals, however, predated this event and its chief theorists prior to the 1880s were A. W. N. Pugin, John Ruskin, and William Morris.

Pugin was a staunch medievalist who promoted the revival of Gothic architecture and ornament in a new, archaeologically correct manner, and his work would at first sight seem to offer little to the future Arts and Crafts Movement. Yet in his writings Pugin laid the foundations for many later critiques of 19th-century design and society. In books such as *Contrasts; or, A Parallel Between the Architecture of the 15th and 19th Centuries* (1836), he portrayed architecture in industrial Britain as a dishonourable trade in the service of commerce and compared it to the higher calling that it had been in the Middle Ages when buildings were designed for the greater glory of God. Subsequent publications of the 1840s amplified this theme and asserted the debased nature of 19th-century Classical architecture and design when compared to the Pointed architecture of the 15th century.

Pugin's linking of style and society was of crucial importance to future members of the Arts and Crafts Movement. Moreover his dictums that "All ornament should consist of enrichment of the essential construction of the building" and that "There should be no features about a building which are not necessary for convenience, construction, and propriety"

expressed a new attitude to decoration and placed a greater emphasis upon function that had a strong bearing on the development of Arts and Crafts philosophy. Furthermore, Pugin's practical involvement in a variety of media including metal, wood, clay, stained glass, wallpaper and textiles, served as an exemplar of a designer not only able to master many different skills but also willing to execute his designs himself rather than pass them down a production line.

Many of Pugin's ideas reached a wider audience in the writings of the art critic and social philosopher John Ruskin. Like Pugin, Ruskin was an outspoken critic of contemporary commerce and design and he berated the nouveau-riche of Bradford and Manchester for the inhumanity of their factories and for the poor quality of their manufactured goods. Imbued with a sense of art as a spiritually uplifting and socially improving activity, he championed the Gothic style in particular as a symbol of artistic freedom. "All noble ornamentation is the expression of man's delight in God's work" he wrote in the famous chapter on "The Nature of Gothic" in his book *The Stones of Venice* (1851–53), and his impassioned defence of medieval art was based not only on its truth to nature, and honesty of materials, but also on his belief in the rights of the individual worker to some form of self-expression. "The right question to ask", he wrote, "respecting all ornament is simply this: was it done with enjoyment – was the carver happy while he was about it". Such views, with their emphasis on the joy of labour and their preference for objects made by hand over those made by machines, exerted a major influence on the future Arts and Crafts Movement and underpinned much of its later thinking.

Ruskin's work was of enormous importance to William Morris who described "The Nature of Gothic" as "one of the few necessary utterances of our age". A key figure in the formulation of Arts and Crafts ideals, Morris was significant both for his practical involvement in the revival of craft practices and design and for his work as a theorist. Born in 1834, the son of a wealthy stockbroker, he embarked on several careers – the church, architecture, and painting – before he finally developed the skill in pattern design which was to become his forte. A decisive event in his determination to establish the decorating firm, Morris, Marshall, Faulkner & Co., was the experience of building his home, the Red House, near Bexleyheath, Kent. Designed in 1859 by his lifelong friend and collaborator, Philip Webb, the exterior of the house was vaguely Gothic in style, and was based on the vernacular domestic architecture and vicarages built by William Butterfield. The interior represented a collaborative endeavour with decorations by Morris, D. G. Rossetti and Edward Burne-Jones and heavy oak furniture designed by Webb. In many ways the Red House may be considered as the first house of the Arts and Crafts Movement; it also therefore represents its first interior.

In the Red House brick is not only used externally in an honest and unassuming manner of which Ruskin and Pugin might have approved, it is also a strong element in the interior where it is left similarly bare and exposed. The idea that exterior and interior should relate was soon to establish itself as a commonplace of the Arts and Crafts Movement. Just as brick is left uncovered so the construction of the roof is left open, rather than boarded over, and Webb seems to revel in the

Arts and Crafts Movement: sitting room, Great Tangle Manor, Surrey by Philip Webb; photographed in 1895

roughness and unevenness of the wide-boarded floors. Everywhere materials are left to speak for themselves, textures and colours contrasting the one with the other rather than being subsumed into an elaborate decorative scheme. Decoratively the house was decked out with painted friezes and stencilled patterns, and the main rooms were further adorned with embroidered hangings. The novelty of its interiors was noted by the artist William Bell Scott who visited the house shortly after its completion. He described "the dining-room or hall [which] had a fixed settle all round the walls, a curious music gallery entered by a stair outside the room, ... and no furniture but a long table of oak reaching nearly from end to end ... the adornment had a novel, not to say startling, character, but if one had been told it was the South Sea Island style of thing one could have believed such to be the case, so bizarre was the execution."

The exterior, by contrast, must have seemed much less remarkable. It was designed in the Gothic Revival style but its details suggested a building which had been added to, and altered, over several centuries. Gothic arches were seemingly filled in at later dates, and extensions made to create a

rambling, asymmetrical and picturesque skyline and façade. Constructed out of red brick, the artisanal nature of the building also undercut the status implicit in the use of the Gothic style. And designed to be comfortable and convenient, rather than as a statement of its owner's wealth or social standing, it has subsequently been viewed as an important landmark in the beginnings of the Domestic, or Vernacular revival in architecture and interiors – a house designed from the inside out in contrast to the strictures of Classicism which often dictated symmetry, harmony and grandeur of proportions over convenience of arrangement and the comfort of rooms.

The building of the Red House convinced Morris of the need for well-designed and executed decorative work and, looking back on this period of his life in 1883, he recalled: "I got a friend to build me a house very medieval in spirit in which I lived for five years, and set myself to decorating it. We found, I and my friend ... that all the minor arts were in a state of complete degradation ... and accordingly in 1861 with the conceited courage of a young man, I set myself to reforming all that, and started a sort of firm for producing decorative articles." The firm was founded with Webb and the Pre-Raphaelite

painters Edward Burne-Jones, D.G. Rossetti, and Ford Madox Brown as partners and initially named Morris, Marshall, Faulkner, and Company after its main financial backers. Though trading as a Limited company, the medieval guild ideal permeated its design practice and work was frequently produced collaboratively. In its first prospectus, it offered to undertake “any species of decoration, from pictures properly so-called, down to consideration of the smallest work susceptible of art beauty” and it is often considered as one of the first modern interior design firms.

Many of the company’s earliest commissions were for ecclesiastical stained glass, as befitted the Gothicism credentials of its chief designers and the dominance of the Gothic style in the third quarter of the 19th century. Other important commissions from this period included schemes for the interiors of the Green Dining Room at the Victoria and Albert Museum (1866), rooms in St. James’s Palace (1866–67), and work in colleges of Cambridge University. Morris himself also began to develop his skills as a designer of surface patterns early on in the company’s history; his first wallpapers, *Trellis*, *Daisy*, and *Fruit*, were designed in 1862 and issued in 1864. Appalled by the highly illusionistic and overly ornate designs favoured by commercial manufacturers, he sought a more “honest” form of expression that would emphasise the two-dimensional nature of surface decoration and used shallow perspective and simple, naturalistic motifs held in formal repeats. Soon afterwards, he was employing the same principles in the design of textiles, carpets and rugs, using natural pigments and traditional dyeing techniques in place of the new, acrid colours created by advances in the chemical industry. As his skills developed so his interests expanded to include tapestry, embroidery, manuscript illumination, typography, furniture, and finally, printing.

Morris’s devotion to medieval (and early Renaissance) designs, and the model of the Guild system made him an early advocate of conservation and in 1877 he and Philip Webb founded the Society for the Protection of Ancient Buildings (or “Anti-scrape” as it became known). The SPAB not only campaigned to save the historic fabric of old buildings from the ravages of insensitive restoration, it also exerted an important influence on contemporary architecture through its understanding of traditional, rational, methods of construction that had withstood the “test of time”. And it was through the regular meetings of the SPAB, no less than through Morris’s tireless design work for the firm, that the next generation of architects and designers came into contact with the new ideas that centered on the ideal of the pre-, or non-, industrial society. This generation was drawn initially from architects working in the practice of Richard Norman Shaw and in 1884 they formed the Art-Workers’ Guild to act as a forum for the re-introduction and encouragement of those traditional methods of design and production that were in danger of dying out in the wake of widespread industrialisation. But because it was based on the model of a medieval guild with its Brothers and a Master, the Art-Workers’ Guild was both semi-secret and highly selective and the Arts and Crafts Exhibition Society was formed to allow for the broader and more open display of objects created in the Arts and Crafts spirit.

The exhibitions included work by W.A.S. Benson, Walter Crane, William Morris, Heywood Sumner, Selwyn Image, W.R. Lethaby, C.F.A. Voysey, A.H. Mackmurdo, Henry

Wilson, and Charles Rennie Mackintosh and many of the progressive young designers of the day. Though not overly prescriptive about the kinds of objects accepted, most of the work on display adhered to the principles of truth to materials and honesty of construction. And, despite the fact that after the first three annual shows of 1888, 1889, and 1890, profits dwindled and the regularity of the exhibitions was reduced, they were widely reported in the burgeoning new art periodicals of the 1890s and brought the Arts and Crafts Movement an international audience and following. The *Studio* magazine, in particular, became an increasingly active promoter of Arts and Crafts products and interiors. An American edition was brought out in 1897, and from 1898 to 1939 the magazine published a series of speculative numbers on topics such as “Modern British Architecture and Decoration”, and from 1907, a yearbook on “Decorative Art”. It continued to promote Arts and Crafts values in the face of Modernism well into the 1920s.

During the 1880s and 1890s, the political character of the Arts and Crafts Movement became more pronounced and the original mission to uphold the dignity of labour through the celebration of craft work became increasingly linked to a determination to improve the lot of the working man and to reform society generally. At the same time, however, many of those involved were forced to acknowledge the contradiction inherent in the fact that hand work was generally expensive to produce and that much of what was made was beyond the reach of the ordinary consumer. Morris himself, who became a Socialist in 1883, ultimately came to view his work as simply “ministering to the swinish luxury of the rich” but this represents too harsh a judgement of a Movement whose innovations had included the introduction of informal, open-plan and more comfortable interiors at a time when the opulence and excesses characteristic of French revivalist styles prevailed. And just as conservative Victorian taste revelled in the power of the machine to reproduce the historical furnishings of the past, so more progressive elements allied themselves with a real past – that of the yeoman farmer – that, due to the agricultural depressions of the late 19th century, was currently under threat.

A nostalgia for a simpler way of life and a growing dislike of modern cities led several Arts and Crafts designers to move out of London to the country. Morris had moved his family and part of his operations to Lechlade, in Gloucestershire in the 1870s. Similarly C.R. Ashbee who had established the Guild of Handicraft in 1888, moved to Chipping Campden in 1901, while Ernest Gimson and the Barnsley brothers moved to Sapperton in 1893. In forsaking more lucrative and socially rewarding careers as professional architects for the “simple life” of Cotswold craftsmen, designers such as Gimson, Ashbee, Powell and the Barnsley brothers led by example, and they formed a network of workshops producing the hand-crafted furniture and interior fittings for many of the Arts and Crafts houses built by Webb, W.R. Lethaby, Edward Prior, Halsey Ricardo, and others in the late 19th and early 20th century.

One of the best-known examples of these houses was Standen, in Sussex, built by Philip Webb in the early 1890s for the solicitor James Beale. Standen’s exterior was designed in Webb’s vernacular style around an existing Georgian farm-

Arts and Crafts Movement: *Daisy* wallpaper by William Morris, 1864

house. The interiors were left deliberately plain – Webb recommended a mixture of whitewash and plain painted surfaces – and the rooms were decorated with Morris & Co.'s wallpapers and textiles. Much of the furniture was designed by Webb, George Jack and W.A.S. Benson and was arranged in an informal manner. Benson also designed many of the electric light fittings, and it is important to remember that many Arts and Crafts interiors appeared lighter not simply because of the preference for lighter colour schemes, but also as a result of the more penetrative effects of the electric light bulb.

Webb's asymmetrical accretative plans where rooms were grouped for internal convenience rather than exterior display were not the only innovations in plan-form introduced by the Arts and Crafts Movement. Architect and fellow Guildsman Edward Prior developed what became known as the "Butterfly" plan, as at "The Barn", Exmouth of 1896–97, whereby the reception rooms were canted forwards at either end in such a way as to catch morning and then afternoon sun. Sometimes referred to as double sun-trap plans they were a development of the north-corridor plan where reception rooms were all south-facing (linked by a north corridor) to gain maximum sunlight. Given the emphasis on raising the standard of decoration and craftsmanship implicit in the Arts and Crafts Movement, together with the emphasis on the contribution of individual designer / craftsmen, changes in plan-form can often seem less important than the decorative revival of Morris and his followers. However this would be to ignore the very thing

which so often gained the Movement an international reputation – that is to say the rational and intelligent planning of rooms and room use which it was hoped would partly transform social relations and shows the Movement at its most idealistic.

The most extreme, and influential example of this new form of planning was the advocacy of the "through-lounge" in what was known as "The Smaller Domestic House." The banishment of the conventional room at the front of a house, kept "for best," with its accompanying room to the rear used for all the day-to-day activities, was seen as a further attempt to create a more open, informal, and even democratic life-style and was a common feature of many of the houses of the Garden City Movement as found in Letchworth and Hampstead Garden Suburb. At its best, in the hands of a designer such as M.H. Baillie Scott, and when the house was large enough, the "through-lounge" was a further reminder of the Middle Ages and the tradition of the Hall house, sometimes complete with a Minstrels Gallery, and an inglenook fireplace to supply a "cosy-corner". However, when applied in large numbers, as was the case in Britain in the period immediately following World War I, the "through-lounge" proved less popular with users than with Arts and Crafts idealists, or ideologues such as the Socialist writer Edward Carpenter. Even where the client was believed to be in sympathy with the ideals of the Movement, as at a new house in Limpsfield for the Garnett family, the original plans for a great hall taken to the extreme of having a central open fire, were rejected in favour of a more usual L-plan with two storeys.

Nevertheless it was certainly this careful approach to planning as much as the simplicity and functionalism of the interior decoration which attracted the Prussian Government architect, Hermann Muthesius, while on appointment to the German Embassy in London. Muthesius wrote a number of articles in periodicals such as *Dekorative Kunst* praising the English Arts and Crafts Movement, and reviewing its major figures. On his return to Berlin he published a three-volume study of their work entitled *Das Englische Haus* (1904–05) which played a major role in disseminating the radical new approach to architecture and interiors. Moreover, where British architects and designers had been open to the charge of being anti-industrial, and even Luddite, Muthesius and the Germanic states saw the Arts and Crafts Movement as a model for "good design" that was capable of being mass-produced through the standardisation of designs and the rationalisation of the work processes. Elsewhere in the German states the Grand Duke Ernest-Ludwig of Hesse had established an Artists Colony at Darmstadt in 1899 with this very intention.

Involving many of the designers of the Vienna Secession such as Joseph Maria Olbrich, the Continental Arts and Crafts Movement tended to be characterised more by the English Free Style of Charles Harrison Townsend and Henry Wilson, or the ornate decorative schemes of Baillie Scott, which it misunderstood as English Art Nouveau. Indeed the English Arts and Crafts Movement generally was often seen as synonymous with Art Nouveau in Continental Europe, despite the fact that many of its principal exponents such as Walter Crane and W.R. Lethaby were vehemently opposed to this style. Similarly, to other British designers, like Baillie Scott and Charles Rennie Mackintosh, who were not as strongly influenced by the some-

Arts and Crafts Movement: design for drawing room with Liberty furniture by Leonard Wyburd, 1907

what severe and puritanical aesthetic espoused by members of the Arts and Crafts Exhibition Society, the Art-Workers' Guild and the SPAB, the overtly stylised, elongated forms, and semi-precious materials favoured by Art Nouveau clearly seemed part of the same Movement. However, in other parts of Europe, principally the Scandinavian countries, the Arts and Crafts Movement philosophy was more clearly understood.

In Sweden Carl and Karin Larsson decorated their simple wooden country cottage on the outskirts of Falun in light, simple, colours during the 1890s. In 1899 24 of the watercolours that Karl made of these interiors appeared in a book called *Ett Hem* (A Home). They were the first of many illustrations showing the influence of the Arts and Crafts Movement in Scandinavia and brought the Larssons to the attention of the *Studio* magazine in 1904. A large exhibition followed in Vienna in 1907 and in 1909 a collection of the Larssons' watercolours and their views on interior decoration were published in Germany in *Das Haus in der Sonne*. By 1912, 10,000 copies had been printed and future publications showed the development of the Larssons' tastes including the incorporation of 18th-century antique furniture, and an increasing emphasis on the rectilinear decorative schemes of the Secessionists and German designers. Although they were not strictly speaking practising designers, the Larssons' influence in Scandinavia was immense and touched fellow Swedes Herman Gesellius and Armas Lindgren and Eliel Saarinen of Finland. In Finland Axel Gallen-Kallela led the reformation of the interior along Arts and Crafts lines in a similarly vigorous manner.

Arts and Crafts interiors were to be found in both town and country houses and in richer and simpler versions. If Standen represents a pure Arts and Crafts interior in the vernacular style, then the so-called Peacock House designed by Halsey Ricardo represents an urban interior at its most jewel like with

its use of "English Glass" developed by Edward Prior, tiles by William De Morgan, and sculpture by William Aumonier. Little wonder that Ricardo's client was the wealthy owner of one of the new department stores, Debenhams, making money partially out of selling the Arts and Crafts lifestyle.

Yet at the heart of the Movement as it developed in the 20th century was not only a deep divide over the benefits of hand production against machine production but also conflicting views about the extent to which Art was compatible with capitalism. Hence the work of many minor groups who operated commercially throughout Britain seems to have been all but ignored by the mainstream of the Movement. Under the umbrella first of the Cottage Art Association, and, from 1884, the Home Arts and Industries Association, hundreds of small regional groups were established which produced craft objects for the home and for sale. Regional classes were established aimed at the socially and physically disadvantaged, and the seasonally unemployed. Designs were often taken from part-works centrally distributed but in more innovative centres such as Newlyn, Keswick, Compton, and Southwold, small craft industries were created with their own distinct designs and designers. In essence small concerns like these spread the philosophy of early "Do-it-yourself" and craft as a leisure pursuit which became such a strong element of inter-war Britain and had an early champion in William Morris's daughter May. Indeed it is often remarked that women gained a measure of independence and recognition through the Arts and Crafts Movement and, while this may to some extent be true, it is also the case that their activities were seen as "home," "minor," or "lesser arts" compared with other areas such as furniture or architecture. Similarly, the work of the small regional classes was often seen as promoting the work of the amateur, rather than the skilled professional, a reputation which the crafts have struggled under ever since.

If European Arts and Crafts was attempting to re-create a pre-industrial past which in turn spawned a National Romanticism, as in the case of the Gödöllő craft workshops established in Hungary, then the United States was still creating its identity and the Arts and Crafts Movement suited its conditions wonderfully. As Gustav Stickley wrote in 1909 "we have no monarchs and no aristocracy, the life of the plain people is the life of the nation". Not only extreme simplicity but an accent on regionalism was a much greater feature of the Arts and Crafts influence as it came to affect the United States, where many small craft communities flourished briefly at the turn of the century.

The writings of Morris and Ruskin were bestsellers in North America and societies for the promotion of their ideas were set up in the 1890s. And in addition to the reproductions in the new art periodicals of the late 19th century, the American Arts and Crafts Movement was also supported by the visits of figures such as Walter Crane, and C.R. Ashbee, who became a close friend of Frank Lloyd Wright. Imbued with the frontier spirit, and less burdened by the baggage of conventional historical styles, American designers were free to be more Arts and Crafts in spirit than the European originators. To Ashbee, whose Guild of Handicraft furniture had been attacked by the *Studio* as "simplicity carried dangerously near triteness", the pioneer spirit of the United States seemed a perfect demonstration of the validity of Arts and Crafts principles. However, Americans also had a more open-minded attitude to the benefits of machine production which they viewed as the servant rather than the master of the designer. Nowhere was this more true than in the work of Wright who declared that "William Morris pleaded well for the simplicity as the basis of all true art. Let us understand the significance to art of that word – simplicity – for it is vital to the art of the machine."

Certain regions, notably the Northeast centered on Boston, the Midwest centered on Chicago, and the West Coast centered on San Francisco, developed their own distinct identities; the Boston Society of Arts and Crafts was founded in 1897 and operated much as the Arts and Crafts Exhibition Society had done in London. Similarly the magazine *The House Beautiful* (1896), was an equivalent of the *Studio* magazine. Among the principal figures in the United States version of the Arts and Crafts Movement were Elbert Hubbard and Gustav Stickley.

Hubbard had visited William Morris in England in 1893 to see the Kelmscott Press before his return to East Aurora, New York, where he established a craft community, the Roycrofters, which was to be one of the most successful of the American Arts and Crafts communities. This success was due in no small measure to Hubbard's earlier career as a soap manufacturer where he developed the mass-marketing techniques he was later to apply to craftwork. Hubbard's work commenced with the creation of a printing works, bindery and leather shop. Roycroft furniture, which began production in 1901, consisted of massive, simple, and unornamented oak pieces like the early furniture of Morris and Webb. Eventually Roycroft also added glass and metalwork products; the metalwork retained its hammered finish to subscribe to the notion of honesty in design. Janet Ashbee described Hubbard as "mostly Ruskin and Morris with a good strong American flavour". However this American flavour was often seen to be a genius for selling

rather than producing, and in many ways Hubbard's determination to make the Roycrofters financially successful was at odds with the ideals of Ruskin and Morris. Nevertheless, Hubbard's entrepreneurial flair helped to spread the influence of the Arts and Crafts Movement across a much broader spectrum of different classes than in Britain.

A desire to reach a wide market also underlay the work of the furniture maker Gustav Stickley who, after meeting Voysey on a European trip in 1898, developed a simple, primitive style capable of being copied by readers of his numerous books and the magazine he established in 1901, entitled *The Craftsman*. This magazine showed interiors in every issue with, as he put it, "material surroundings conducive to plain living and high thinking". The magazine was supplied free as a way of gaining orders for furniture and other products. The interiors were all open-plan, with low ceilings and leaded windows, and featured wood-panelled walls with stencilled decoration and fireplaces with inglenooks. So ubiquitous did they become that Stickley designs for houses such as the Hawley Residence, Baltimore (1900) were readily called "Craftsman style". Like his European contemporaries Stickley organised his workshops on a guild basis, but the sheer volume of work he received enabled an expansion seemingly incompatible with such craft ideals. At its height Stickley employed more than 400 workers and developed a distinct idiom seen as part and parcel of the more indigenous Mission style. This association was in part because of its links with Spanish 18th century colonial churches, and in part due to Stickley's statement that "a chair, a table, a bookcase or bed must fill its mission of usefulness as well as it possibly can ... the only decoration that seems in keeping with structural forms lies in the emphasizing of certain features of the construction, such as the mortise, tenon, key, and dovetail." However, despite his statement that furniture should reveal "just what it is, how it is made, and what it is made for", in reality Stickley was not above using dowel joints, oak veneers, and plywood in his furniture to reduce costs while maintaining the appearance of the Arts and Crafts style.

In terms of the plan-form the architects of the Arts and Crafts Movement in the United States developed the house plan fully with the creation of open-plan houses. The style is most often associated with Wright's early Prairie houses of the Midwest; other notable architects wedded to Arts and Crafts notions included the practice of Greene and Greene in California. In Wright's case the Prairie house not only related to the landscape through the choice of materials but also through the long, low horizontals of the composition, with low-pitched roof and wide eaves, that mirrored the landscape of the midwestern states. The interior was conceived as a series of interpenetrating spaces as at the Ward Willits House of 1902, and the Robie House of 1909. Like Webb before him, Wright unified his designs by bringing materials used externally through to the interior. A common problem with the Arts and Crafts interior was the dilution of the simple uncluttered effect sought by the incorporation of the owner's own furniture and fittings which could be unsympathetic to the purity of the Arts and Crafts design language. Hence Wright designed many of his interiors with built-in light fittings and cupboards thus extending the designer's control over the character of the interior and effectively creating the modern notion of "lifestyling." Despite Wright's democratic concerns it was in practice left to

the development of the wooden, open-plan, bungalow – often self-built and with furniture made from designs by Stickley – to be the ultimate expression of the Arts and Crafts ideal of the democratisation of the Arts. These simple, hand-crafted dwellings gave visible form to William Morris's desire for "an Art made by the people, for the people, as a happiness to the maker and the user."

Ashbee, C.R. 1863–1942

British architect, designer and design theorist

Founder of the Guild and School of Handicraft, C.R. Ashbee was a major force behind the Arts and Crafts Movement. His efforts to determine a place for the aesthetic and values of traditional craftsmanship in a modern industrial society exercised an important influence on British artistic and cultural life at the turn of the century. And in his own work he showed how the aesthetic of simplicity, which formed one aspect of the Arts and Crafts ideal, could progress from the hand-crafted to the machine-made, without any diminution of the tenets of the movement.

After studying history at Cambridge, where he was influenced by Ruskin, Morris and the Romantic socialist Edward Carpenter (1844–1929), Ashbee entered the office of the architect G.F. Bodley in 1883. In 1886 he moved into Toynbee Hall, the philanthropic University foundation in London's East End, where he offered a class on the writings of Ruskin. In an attempt to explore the dignity of labour, the following year his students executed a plasterwork panel for the dining room at Toynbee Hall which involved free-hand wall paintings punctuated by gilded modelled bosses and medallions. This collective endeavour prompted the establishment, in 1888, of the Guild and School of Handicraft. Partly inspired by A.H. Mackmurdo's Century Guild, Ashbee's idea of a craft school with a workshop at its centre was very much in tune with contemporary ideas on the teaching of art and craft and the technical education movement. By presenting the Guild as "artistic" decorators producing stained glass, furniture, fabrics and wallpaper that catered to advanced architectural tastes rather than the trade, he allied their work to the decorative art movements of the 1880s. The Guild also produced metal, silver and leatherwork, and as none of the pupils had any craft skills of their own, John Pearson, a metalwork instructor specialising in decorative repoussé work was employed. Other founder members included Fred Hubbard, responsible with Ashbee for decorative painting and general administration, and John Williams a metalworker. C.V. Adams, the cabinet-maker, was of particular significance in that he put Ashbee's ideas into practice organising a real co-operative workshop.

Early examples of the Guild's work were shown at the Arts and Crafts exhibition Society in 1888, and they also showed at

the 1889 and later Arts and Crafts Exhibitions. Designs for furniture and metalwork for Riseholme Hall, near Lincoln, for Herbert J. Torr were followed by further commissions during 1889, including the design for a repoussé copper frame for Holman Hunt's *May Morning on Magdalen Tower, Oxford*. A large order in 1892 for panelling, decorative painting, leatherwork, metalwork and furniture – all to Ashbee's designs – for James Rankin's country house, Bryngwyn rescued the Guild from financial difficulties. As a result it was able to expand, and new recruits included Walter Curtis, Bill Hardiman and W.H. White. The latter were taught the techniques of modelling and casting in silver and their silver and metalwork was executed in a complicated Art Nouveau style.

Furniture was probably made from the earliest days of the Guild. Record books show that they made much the same types of furniture as trade cabinet-makers, and prices were comparable with those of firms such as Heal's and Harrod's who served the upper end of the middle-class market. They made occasional tables and chairs, cabinets of various kinds, sideboards, dining tables and chairs, desks and writing tables, and wardrobes and wash stands, but Ashbee did not like the many-shelved pieces like what-nots or overmantels, or elaborate upholstery. His admiration for vernacular and antiquarian styles encouraged the production of a limited number of traditional settles and trestle tables, but, on the whole, the Guild favoured heavy or fixed pieces such as cabinets to go against the wall. These pieces were unmistakably joiner's furniture, made of heavy members in explicit frame and panel construction; the usual woods were oak, basswood and walnut. Cabinets were solid and enclosed rather than open in structure, and the detailing was traditional; frame and panel elements were usually moulded and fielded, legs were often bracketed, and cornices were normal, with occasional resonances from the 16th and 17th centuries. While some pieces were quite plain and others – notably an oak cabinet for the New School at Abbotsholme whose doors were covered with a delicate design of undulating sprays of laurel interspersed with lines from Blake's writings – were painted. Ashbee's favourite form of decoration was coloured and gilded gesso applied sparingly to the wood. Compared with much light-weight, highly decorated trade furniture of the time, the overall character of these early pieces was of solid, traditionally constructed items with broad, restful surfaces.

Ashbee's later furniture was simpler and he was influenced particularly by the puritan sparseness of C.F.A. Voysey and Charles Spooner, both of whom exhibited at the Arts and Crafts Exhibition Society Exhibition of 1893. The enlarged Guild exhibited five pieces at the Society's Exhibition of 1896 and Ashbee's music cabinet in oak attracted considerable attention. In 1897, Ashbee was invited by the architect M. H. Baillie Scott to collaborate on the design of furniture and interior decorations for the dining room and drawing room of the Grand Duke of Hesse's palace at Darmstadt in West Germany. Ashbee was asked to design the light fittings and the Guild to make both fittings and furniture. Perhaps not surprisingly, Ashbee's work began to develop along the same lines as Scott's and the furniture of his mature period was boxy and rectangular in form, with clear, linear ornament. Cabinets were treated as boxes on legs; legs were more often than not square in plan and met the body without brackets; and almost all the carcase

furniture was built up of simple planks. Gesso was abandoned and painting used only occasionally; instead Ashbee made great play with metalwork and inlay. Early, relatively discrete hinges gave way to long, wide, medieval-style straps of wrought iron, pewter or steel that ended in characteristically fleshy, natural forms. For inlays, Ashbee used the simple motif of rectangular or lozenge-shaped panels – two or three inches across – each inlaid with a conventionalised, almost linear plant design made from combinations of pewter, satinwood, ebony, holly and coloured woods. These panels were most effective on plain pieces of furniture, where they helped to relieve and enhance the puritanism of Ashbee's designs. By 1900 he was no longer content to produce austere or solid versions of existing furniture types and designs such as an oak and holly piano case (c.1900) demonstrate a new independence in his work.

For much of his career, Ashbee was also active as an architect and in the mid 1890s he designed several houses in Cheyne Walk, Chelsea. These included his mother's house, the Magpie and Stump (1893–94), whose complex and eclectic interiors served as a kind of showroom for the Guild and represent the most interesting example of their decorative work. The hall was a bare reddish room with little except the chimneypiece, whose panel of what appeared to be green tiles was in fact made up of plaques of plain and repoussé copper and coloured enamels, to catch the eye. The back wall was covered with an expanse of embossed leatherwork, incised, modelled and gilded by Bill Hardiman. The first floor drawing room was furnished with a mixture of antique and modern furniture and the walls were covered with papers in two tones of peacock blue. These papers were the most ambitious of the Guild's wallpapers and contained an undulating pattern of briar-like plant forms crowned by a frieze of Tudor roses and emblems of the wheel of fortune. The chimney breast was painted by Roger Fry, depicting a rather formal landscape garden, with a narrow canal. Ashbee drew upon the special skills of the Guild for the decorative metalwork of his copper and pewter fittings and the *Studio* compared the light fittings and the architectural metalwork to jewellery on a large scale. The dining room was long and austere. The walls were clad in plain wood panelling, painted a light colour and surmounted by a painted frieze, and the furnishings included rush-seated chairs and trestle tables.

After the Magpie and Stump, Ashbee's style of interior design, like his furniture, became more simplified as is evident in his Cheyne Walk houses of c.1898 and many of the small middle-class houses that he built in the country. His preferred form of decoration during this period was panelling, divided vertically, as in the hall at 39 Cheyne Walk, and if he could not panel then he would simply paint. For the frieze he liked a theme. If that were not possible then he would sometimes use plasterwork modelled in low relief, but never flat coloured pattern. Ashbee's fireplaces were typically austere and vertical and somewhat unhomely. They were sometimes made of cast iron, such as that in 39 Cheyne Walk. Rejecting the rich textures characteristic of advanced taste in the 1870s and 1880s, Ashbee also eschewed the cosy and nostalgic medieval ambience sought by contemporaries such as Baillie Scott. Nor was he interested in the subtle yet formal combinations of colour, tone and line favoured by Charles Rennie Mackintosh and the work of the Austrian school. He belonged instead to

the mainstream of the English Arts and Crafts movement, designing reserved, light interiors where the character was given by panelling, a little plasterwork relief, and the careful handling of the chimneypieces; interiors which did not create an intense and separate atmosphere, but were continuous with the architecture; interiors which provide a setting for furniture without determining its character.

Towards the end of 1901, the lease on Essex House, London, where the Guild had been based since 1891, was nearing its end, and on Ashbee's return from America the Guild moved to Chipping Campden in Gloucestershire thereby conforming to the Romantic, rural ideal that was at the heart of much Arts and Crafts teaching. Soon after this move, Ashbee embarked on one of his most successful interior commissions for the library of Madresfield Court, Worcestershire. His clients, the 7th Earl of Beauchamp and his wife, were keen patrons of Arts and Crafts work and the library included light fittings by the Birmingham Guild of Handicraft. Ashbee's work was essentially that of embellishment and in 1902–03 he installed two single and one pair of double doors in oak. These were framed up in Ashbee's usual way and scattered among the panels were scenes appropriate to a library, carved in low relief by Alec Miller. The contrast between the broad framing and the carved panels, the vivid ornament on the pewter door furniture, and the delicacy of Miller's carvings attest to the skill and maturity of Ashbee's designs. A second stage of work – carried out in 1905 – involved decorating the ends of the two free-standing book-cases with carving. One end carried an image of the Tree of Knowledge and the other depicted the Tree of Life, thus encapsulating the contrast between sacred and profane learning through the imagery and decoration. These panels set the tone for the interior, replacing warmth and conviviality with an emphasis upon more philosophical ideas.

From the 1900s Ashbee was also increasingly active as a printer and designer of jewellery. After Morris's death in 1896 he acquired some of the Kelmscott Press equipment to start the Essex House Press; its first book, Cellini's *Treatises on Goldsmithing and Sculpture* (1898), translated by Ashbee, was dedicated to the Guild. Ashbee designed his own typeface, Endeavour, first used on *An Endeavour towards the Teaching of John Ruskin and William Morris* (1901). In the *Studio* winter number of 1901 to 1902 Aymer Vallance recognised Ashbee's pre-eminence as a designer of jewellery, and he was feted in Budapest in 1905. A laudatory account of the Guild appeared in *Kunst und Handwerk* (1907) but in the same year the Guild failed. Ashbee published an inquest entitled *Craftsmanship in Competitive Industry* in 1909. His *Should We Stop Teaching Art?* (1911) advocated government-endowed "small artistic workshops" run along similar lines to that of the Guild. From 1917 he was involved in town planning in Egypt and Jerusalem, but in 1924 returned to England and devoted himself to theorizing and his memoirs.

Like Voysey and Baillie Scott, Ashbee designed principally for middle-class urban and suburban homes. His aim was to bring reasonableness and simplicity to domestic living and his furniture offered a radical alternative to mainstream and cottage-style design. And if the demise of the Guild brought an end to these ambitions, it signalled not so much the failure of

his designs as the impracticability of craft production in an era of mass production.

Biography

Charles Robert Ashbee. Born in London, 17 May 1863, the son of Henry Spencer Ashbee, a city merchant and connoisseur of erotica. Educated at Wellington, and at King's College, Cambridge, 1883–86, where he became friends with Roger Fry and Goldsworthy Lowes Dickinson, and met the philanthropist Edward Carpenter. Married Janet Forbes c.1898: 4 daughters. Trained as an architect under the Gothic Revivalist G. F. Bodley, 1883–86. Resident at Toynbee Hall, a philanthropic foundation in London's East End, 1886; taught evening classes in drawing. Active as an architect and designer of furnishings, silverwork and jewellery from 1888. Founded the Guild and School of Handicraft, Toynbee Hall, 1888; Guild moved to Essex House, Mile End Road, London, 1891, and became a limited company, 1898; workshops moved to Chipping Campden, Gloucestershire, 1901; Ashbee established the School of Arts and Crafts, Chipping Campden, 1904 (active until 1914); Guild went into voluntary liquidation, 1908. Founded the Essex House Press, 1898. Travelled to the US in 1900, and again in 1909–10, when he met Frank Lloyd Wright. Professor of English, Cairo University, 1915–19. Adviser to the British government on the restoration of Jerusalem, 1919–23. Participated in numerous exhibitions including the Arts and Crafts Exhibition Society from 1888, and the Vienna Secession 1900, 1902, 1905 and 1906. Published several books on crafts and design. Member, National Trust; Council Member from 1896. Died in Sevenoaks, Kent, 23 May 1942.

Selected Works

Collections of Ashbee's architectural drawings are in the Drawings Collection of the Royal Institute of British Architects, the Chelsea Public Library, and the Victoria and Albert Museum, all London. The Victoria and Albert Museum also holds catalogues and Minute Books relating to the Guild of Handicraft for the period 1888–1907, an album of letters and printed ephemera, and original designs by Ashbee for furniture, metalwork, jewellery, etc. The Ashbee Journals (more than 50 volumes) are in King's College Library, Cambridge. Examples of Ashbee's furniture are in Cheltenham Art Gallery and Museum; examples of metalwork and jewellery are in the Victoria and Albert Museum.

Interiors

- 1887 Toynbee Hall, London (decoration of the dining room; with the Guild of Handicraft)
- 1892 Bryngwyn, Herefordshire (decorative scheme including a wall-painting and decorative frieze): James Rankin
- 1893 Magpie and Stump, 34 Cheyne Walk, London (building, interiors and furnishings; decorative work by Roger Fry, Christopher Whall and others): Mrs. H.S. Ashbee
- 1897–98 Grand Ducal Palace, Darmstadt, Hesse (design of light fittings; production of furniture and fittings designed by M. H. Baillie Scott): Grand Duke Ernest Ludwig of Hesse
- 1897–98 74 Cheyne Walk, London (building and interiors): F.A. Forbes
- 1898–99 39 Cheyne Walk, London (building, interiors and furnishings; frieze of Cheyne Walk by Fleetwood Varley): C.R. Ashbee
- 1902–03 Madresfield Court, Worcestershire (library fittings and furniture; carving by Alec Miller): 7th Earl of Beauchamp
- & 1905 Norman Chapel, Broad Campden, Gloucestershire (remodelling of the building, additions and interiors)
- 1905–07 De Szász House, Budapest, Hungary (building and interiors): Zsombar de Szász

1907–09 Villa San Giorgio, Taormina, Sicily (building and interiors; decorative carving by Alec Miller and Will Hart): Thomas Bradney Shaw Hellier

Ashbee's designs for furniture, decorative metalwork, silverwork, light fittings, embossed leathers and jewellery were carried out by the Guild of Handicraft, 1888–1907. He also designed pianos for Broadwood, c.1900, and cast-iron fireplaces for Falkirk Iron Co., 1897.

Laura Ashley Ltd.

British manufacturer and retailer of home furnishings and clothing; established 1953

By 1985 the name of Laura Ashley was emblazoned above more than 180 forest green shop fronts from Tunbridge Wells to Tokyo, selling a complete Laura Ashley lifestyle. Fabrics, wallpapers, furniture, floor coverings and a range of accessories for the home as well as clothing were displayed in shop interiors intended to recreate an English Country House look, while glossy annual catalogues and books showed how customers could recreate the look for themselves.

Bernard Ashley provided the technical and entrepreneurial skills for the rapid and massive expansion of the firm, but it was Laura who was the design pioneer, finding sources of patterns in nature and the past, especially the Victorian period, for the fabric and wallpaper prints which were to become the firm's signature, together with its distinctive colour palette and the use of natural fabrics. Through the interiors of the Ashleys'

own much photographed homes and lifestyle, she also associated the company with a style of decorating that sought to recreate a nostalgic, rural way of life whether lived in the English country house, rustic cottage or urban terrace.

Home furnishings were launched in the early 1970s when the company had already established a reputation for its romantically styled women's clothing. Some of the small scale designs used on dress fabrics were simply printed onto wallpaper and a wider width lightweight cotton, christened "Country Furnishing Cotton". Early collections included paisley and heraldic designs, but it was the monochrome, small scale florals, for example *Petite Fleur*, a sprig, and *Wild Clematis*, a design of trailing flowers and foliage, and geometrics such as *Nutmeg* which were successful in the long term. Some designs were available in positive and negative prints of each colour-way: by the early 1980s the positive print was usually used on wallpaper, the negative on the coordinating fabric. This system, initially imposed by technical problems involved in printing in more than one colour, enabled easy coordination of wallcoverings and soft furnishings, and also hid any imperfections in the fabric with what were later dubbed "itsy bitsy prints". Patchwork quilts were a favourite source for prints, and also inspired the made up quilts sold in Laura Ashley prints. The homely, cottage look for which the firm became known in the 1970s is shown in the child's bedroom at Rhyddollog, where a patchwork quilt uses all the prints featured in the room: *Floribunda* covers the walls and ceiling while the cotton *Cottage Sprig* is used for the frilled curtains (available made to order from the early 1980s) and tablecloth. A larger scale print, *Meadow Flowers*, is used on the bed. These products were all sold very cheaply and appealed to young couples setting up home as well as to women who had already bought the "Laura Ashley" look in clothing and wanted to decorate their home in the same romantic, ruffled style.

Colour was another important element in identifying an early Laura Ashley interior. In contrast to the widely available garish florals and bright abstracts the company offered muted combinations of cream with a sludgy blue named "smoke", plum or terracotta, intended to evoke old vegetable dyes, while cherry, rose or moss with white gave a contemporary freshness to the prints. The names given to colours, and prints (from 1983), deliberately linked them to the countryside (e.g., *Dog Rose*, *Wild Strawberry*), or earlier periods of decoration (e.g., *Queen Anne's Needlework*).

Early prints were seen by the customer as particularly suitable for use in small bedrooms, bathrooms and nurseries. In 1983 the company introduced 13 larger scale prints, and some new wallpaper designs to work with them. They were printed on the carefully named "Drawing Room Fabric" to reinforce the message that Laura Ashley was suitable for downstairs rooms and master bedrooms, hanging at large windows and four-posters. The majority were florals, based on faded chintzes, such as *Blue Ribbons* and its accompanying wallpaper *Red Rose*, which were shown in the dining room of the Ashley's French château. A striking gold and burgundy print, *Venetia*, was also launched, together with upholstery fabric, rugs and tiles which coordinated with the main print collection.

These prints used the same colour palette as the existing

Ashley: Emma Ashley's bedroom at Rhydoldog in Wales, an early interior

small scale designs, and formed the backbone of the English Country House style which characterised the firm's output in the 1980s, in contrast to the cottage style of the 1970s. The change was partly to expand the market for the firm's products, but was also influenced by the Ashley's own changing tastes and new pattern sources. Master prints such as *Country Roses* were printed with a coordinating minor print of a rosebud on the same trellis ground, *Boudoir*, and used by Laura in the main bedroom at Rhydoldog. The elaborate hangings on the half tester, the traditional window treatment

and the mass of cushions were all elements of the "Made To Order" lifestyle Laura Ashley could offer customers as far afield as Shrewsbury and San Francisco. This style had particular appeal in the USA where the company enjoyed a more upmarket image than in Britain. The firm was invited to decorate a house in Colonial Williamsburg.

The colour range also expanded: *Alba Roses*, a chintz launched in 1987, was available in butter yellow ("cowslip") and jade, and described as reproducing colours "kissed by the sun". Richer colours such as dark green, crimson, navy,

burgundy and sand were especially popular in Owen Jones-inspired patterns such as *Mr. Jones*. The sources for new designs were also changing; *Cottage Sprig* had been inspired by a poster. Later prints were often reworked from historic textiles and wallpapers found by Laura in country houses (e.g., *Priory* from a fabric at Chatsworth) and museums (*Regatta*, a dress and furnishing fabric, was copied from a dress in collection at Platt Hall, Manchester; Tozer and Levitt 1983).

The expanding range of prints was also intended to “offer the possibility of achieving more sophisticated period ration” (Laura Ashley in the 1983 Home Decoration catalogue). *Salon* was used in this way, with a grisaille border and cut-out prints to create a print room at Rhyddoldog. It was used again in the far more sophisticated surroundings of the Ashleys’ Brussels house for the curtains and as a panelled wallpaper in the Salon, where the yellow scheme and cords and tassels on the goblet-pleated curtains recall Nancy Lancaster. But what identifies this room as a Laura Ashley interior is the large-scale floral chintz in a favourite combination of Ashley’s, lilac and grey, used on the chairs, full-length fabrics and cushions.

This pattern was adapted from an 18th-century French silk and came from the “Laura Ashley Decorator Collection”, launched in 1980. Although Ashley claimed the company aimed to make its prints as timeless as possible, customers’ expectations of a Laura Ashley look did not move fast enough for her changing tastes and print research. The collection was sold initially through a London showroom and then interior design shops. Some were subsequently added to the main collection, e.g., the *Reveillon* prints, inspired by 18th-century French wallpapers, produced as wallpaper, chintz and satin weave fabric. These 18th-century patterns represent a definite move away from purely Victorian sources, and were often inspired by the grand interior schemes devised by Laura Ashley and her staff for the château at Remainnil using patterns taken from *toiles de jous* and floral silks. Not only did the prints become more sophisticated, interiors were also created based on contemporary sources. A carved bed original to the château was first shown in a fresh yellow and blue scheme with *Windspray* (based on an American stencil) at the windows and the striped wallpaper *Riviera*. Later the bed was used in Ashley’s bedroom, the scheme inspired by a Sèvres plaque (Irvine 1987) using *Cirque* striped cotton batten on the walls, and for the bed drapes and curtains, whose pelmets copied an 18th-century drawing.

The range of fabrics was also expanded during the late 1980s, particularly for upholstery such as woven jacquard, ottoman, damask and checks. Furniture and home accessories were also built up from a “classic” loose covered sofa and armchair (*Montgomery*, introduced 1987) to include ranges of occasional and carcass furniture (for the bedroom and kitchen), and accessories included kitchenware, curtains and door fittings. Many of these ranges sold poorly and only served to dilute the company image which Laura Ashley, who died suddenly in 1985, had cultivated so carefully. Recent developments have included increased choice in window treatments and upholstered furniture, refocusing on the prints and colours with which the company is identified.

Few of the company’s designs can be described as authentic reproductions. Even originals were copied, as at Charleston Farmhouse in England, the designs were adapted and

recoloured onto a different fabric for sale in the shops. This collection was a rare venture into 20th-century sources for the firm – chapters on Modernism are always the last in the company’s interior design books and concentrate on how “classic” florals can be used with checks and stripes. In the UK the company has been seen to grow from a family business selling cheap fabrics and wallpaper to a high street retailer with pretensions to be an interior decorator, but lacking the individuality and spontaneity sought by more sophisticated customers. It continues, however, to evoke a strong image of the past and rural life, and now has its own archive on which to draw, recolouring *Trefoil*, a 1980s print, for the 1995 collection.

Asplund, Erik Gunnar 1885–1940

Swedish architect and designer

Erik Gunnar Asplund is Sweden’s greatest 20th-century international architect; he played a key role in Scandinavian architectural developments during the inter-war years, influencing colleagues such as Alvar Aalto. Initially working in the National-Romantic style, he adopted Neo-Classicism, a significant factor in this move being his tour of Italy in 1914.

Asplund's Neo-Classical style became increasingly pure, leading finally to his conversion to Modernism.

One of Asplund's earliest works was his interior for the Home Exhibition at Liljevalch's Art Gallery, Stockholm in 1917. The event was organised by the Swedish Society of Crafts and Design with a "social mission" to improve the design environment of the underprivileged urban proletariat. Although, not surprisingly, the show was not much visited by this group, critics singled out Asplund's atmospheric interior for its painstaking attention to detail – something that would become a trademark of all Asplund's work. The kitchen-living-bedroom space was decorated in light blue and white. Stained pine was used for the sturdy vernacular-inspired furniture, as well as for the ceiling and window frames. Rag-weave runners on the floor, a canary in a cage, and children's clothes drying by the stove, completed the homely feel. There were influences from both Carl Larsson's *Ett Hem* pictures as well as the continental Beidermeier style.

The 1920s saw Asplund's last commissions of representational, ceremonial furniture for civic buildings. His Neo-Classical furniture adorns the Councillors' Corridor in the Stockholm City Hall – a kind of waiting room with chairs, mirrors and a cupboard for coats. The grey and white lacquered birch chair with its straight lines and balanced proportions is particularly elegant. Grey painted cane is used for the seat and circular centre, framed by a square backrest. A cow's skull adorns the front edge of the seat. The leg of the adjoining table terminates in a horse's hoof. Asplund's Study at the 1925 Exposition des Arts Décoratifs in Paris continues this Neo-Classical theme. Its *pièce de résistance* was the luxurious *Senna* armchair with simplified Empire lines which was re-issued by Cassina in the 1980s.

A central theme in Asplund's work is the transition from exterior to interior. This is featured in the Skandia Cinema, and perfected in the Stockholm City Library. The latter building consists of a cylinder on a cube, designed around the form of the innermost room – a typical Asplund strategy. The rotunda is lined with bookshelves centred on the circular lending desk. The stairs to this space begin at street level and gradually narrow as they proceed to the main reading level. On reaching the counter the visitor is struck by a sense of space and light. Asplund designed the furniture, shelving, lamps and door handles. About twenty different chair types were involved, each one having its own character, detailing, finish and specific function. They ranged from the Chief Librarian's *klismos*-inspired mahogany armchair, with leather upholstery and brass detailing, to its plainer stained birch counterpart in the Reading Room. The room's original colours were warm green, terracotta and yellow. Even the children's section has specially designed small-scale furniture. This is sturdy with a Nordic vernacular feel; the surface of the wood has a "brushed" tactile finish. A "Sandman" mural forms the atmospheric backdrop to the story room, with a ceiling painted in dark blue.

Asplund's architectural framework for the influential Stockholm Exhibition of 1930 marks his overnight conversion to Modernism – known as Functionalism in Scandinavia. This is also reflected in the furniture designed for the boardroom of the Swedish Society of Crafts and Design in the following year, although an echo of the curved Empire back of the library chair persists in the tubular steel seating. The armchair uses a

minimum of tubing, but instead of being turned at right angles in the style of Le Corbusier, it follows a gently sweeping curve to the tip of the back leg. The up-market retailer Svenskt Tenn recently revived the design for a low tubular steel and leather hump-backed stool dating from 1933.

Significantly, Asplund's individual form of Modernism soon developed into a more gentle, traditionally based, humanist form of Swedish Functionalism. In his modest country cottage, Stennäs, the white unadorned-adorned living room conveys a homely and relaxed atmosphere. The room is dominated by an organic, grotto-like inglenook, and comfortable, white painted wood furniture – including a curvaceous sofa and a low table with a brown limestone top – frames the large panorama window.

Besides using colour and materials to create atmosphere, Asplund was very aware of how light can influence the perception of an interior, and of how, on entering a room, visitors react differently depending on how it is lit. The relation between windows and doors was therefore of considerable significance to him; there was also an awareness of how the placing of furniture influences behaviour and movement. In the Göteborg Law Courts, for example, the down-lighting of the main entrance hall creates a "distanceless" roof. Asplund also modified the standard measurements of the staircase steps, thereby forcing the agitated visitor to slow down and collect himself.

His chair for the "dock" ran counter to the stool specified in the design brief. Why, he argued, should someone who was innocent until proved guilty sit in a less comfortable seat than anyone else? Similarly, he saw no reason to exaggerate the dimensions of the Chairman's chair. This was made of hickory, with a T-shaped dark brown upholstered back. For more general use, Asplund designed a blond Thonet-inspired chair (made today by Cassina). Adorning the light wood panelled walls are textile hangings such as *Paragrafer* which featured paragraph symbols, exclamation and question marks, alluding to the difficult decisions to be made in the room. Elsewhere, cane furniture, large windows and pot-plants evoked the impression of a winter garden or conservatory.

The Woodland Crematorium shows further Asplund subtleties. The colonnade surrounding the main room echoes the loggia outside. The arched suspended roof and the bright frescoes (by Sven Erixson) intensify the sense of light and spaciousness. There are no formal religious symbols. The interior stresses the gallery surrounding the catafalque rather than the altar. Visitors sit on simple wooden pews, and their attention is captured by the limestone floor which was intended to provide something to focus on in difficult moments. In an adjoining room, wood panelling merges nearly invisibly into a bent laminate bench. These spaces convey a sense of intimacy and privacy. The Woodland Cemetery, with crematorium and three adjacent chapels, was a major and highly influential project. In 1994 it was placed on the UNESCO World Heritage List.

Asplund was, in the words of one Swedish critic, "more an artist-architect than a great innovator, a sensitive interpreter of a changing society in forms that expressed cultural continuity". His interiors and furniture may have sometimes veered towards being too precious. But they nevertheless express a unique psychological awareness and empathy, and it should be

remembered that with few exceptions, Asplund's furniture was designed for specific purposes and settings. Since the 1980s, Asplund's timeless blend of classicism and Modernism has been the subject of renewed international interest and debate among both rationalists and Postmodernists. And he still represents a major source of inspiration for many of today's leading Scandinavian architects and designers.

DENISE HAGSTRÖMER

Biography

Born in Stockholm, 22 September 1885. Studied architecture at the Royal Institute of Technology, Stockholm, 1905–09: awarded travel scholarship, 1910, and travelled to Germany. Studied at the independent Klara School of Architecture under Carl Bergsten, Ivar Tengbom, Carl Westmann, and Ragnar Östberg, 1910–11. In private practice, 1911–40. Assistant lecturer, 1912–13, Special Instructor in Ornamental Art, 1917–18, and Professor of Architecture, 1931–40, Royal Institute of Technology, Stockholm. Also designer of furniture and interiors for public and private commissions. Married 1) Gerda Sellmann, 1918 (divorced 1934); 2) Ingrid Katarina Kling, 1934. Editor, *Arkitektur*, Stockholm, 1917–20. Died in Stockholm, 20 October 1940.

Selected Works

- 1913 Villa Selander, Örnsköldsvik (building and interiors): Selander family Villa Sturgården, Nyköping (building and interiors)
- 1914 Dr. Ruth's Villa, Kuusankoski, Finland (building and interiors): Kymmene Ltd.
- 1917 Home Exhibition of the Swedish Society of Arts and Crafts (interiors): Liljevalch's Art Gallery, Stockholm
- 1917–18 Villa Snellman, Djursholm, near Stockholm (building and interiors): Snellman family
- 1920 Workshops Society Exhibition, Stockholm (interiors)
- 1920–28 City Library, Stockholm (building, interiors, furniture): Stockholm City Council
- 1921 Stockholm City Hall (furniture)
- 1922–23 Skandia Cinema, Stockholm (remodelling of building and interiors)
- 1925 Exposition Internationale des Arts Décoratifs et Industriels Modernes, Paris (pavilion)
- 1931 Swedish Society of Arts and Crafts, Nybrogatan 7, Stockholm (fittings and furniture)
- 1932 Nationalmuseum, Stockholm (project for interiors)
- 1933–35 Bredenberg Department Store, Stockholm (building, fittings and interiors)
- 1933–37 Summer residence, Stavsnäs (building and interiors): B. Beckström
- 1934–37 Göteborg Law Courts (rebuilding and interiors)
- 1937 Stennäs House, Sorunda, Stockholm (building, interiors and furniture): G. Asplund
- 1940 Woodland Crematorium, South Cemetery, Stockholm (building, interiors and furniture)

Associated Artists

American interior decorating firm, 1879–1883

Associated Artists was created in 1879 by the partnership of Louis Comfort Tiffany (1848–1933), Samuel Colman (1832–1920), Lockwood de Forest (1850–1932) and Candace Thurber Wheeler (1827–1923). This partnership lasted four years, during which time the company (also called Louis C. Tiffany and Company) won many of the most prestigious American commissions of the period, including the redecoration of the White House in 1882.

Each of the partners managed a separate department in the firm, although they worked together closely to complete harmonious and luxurious interiors incorporating layered patterns, subtle colors and rich materials for some of America's most affluent clients. Tiffany directed the firm and was in charge of stained glass, Colman was consulted for color and flat patterns, de Forest oversaw carvings, furniture and wood decoration, and Wheeler supervised textiles.

Typical characteristics of the firm's interiors included the use of exotic motifs, such as those from Moorish or Near Eastern art, combined with East Indian and Japanesque features; layering and juxtaposition of patterns on the walls and ceilings; contrasts in light and dark and textures; delineation of rooms through the use of different decorative motifs and colors; and integration of paintings and pottery into decorative schemes. The most innovative creations of the firm were

the inclusion of pale colors, with gradations from dark to light as the colors moved up the walls, the striking and abundant use of silver and gold details, and the augmentation of surfaces with extraordinary materials such as mother-of-pearl and metals on walls and ceilings as well as furniture.

Tiffany, Colman and de Forest began their careers as painters before turning their attention to the integration of artistic principles with interior decoration. Tiffany, who had studied painting under Colman, visited Europe and North Africa with him during the early 1870s. De Forest also travelled to Europe, Egypt, Syria and India, and in 1881, he established wood and metal workshops in Ahmadabad, India, in order to revive traditional Indian carved wood and perforated brass designs and crafts. These foreign tours, especially those in the Near East and North Africa, played a significant role in providing source material and inspiration for many Associated Artists designs.

Wheeler, who had learned spinning, weaving and knitting as a child, was inspired by a display of needlework from the South Kensington School of Art at the Centennial Exposition of 1876 in Philadelphia to organize the Society of Decorative Art in New York. Wheeler's Society, which was modeled on London's Royal Society of Art Needlework, sought to provide meaningful employment for women and to stimulate women's opportunities in artistic pursuits. It was Wheeler who first brought Tiffany, de Forest and Colman together as collaborators in artistic furnishings, when she invited these painters to teach her students design principles.

Associated Artists collaborated on some of the most important public and private commissions between 1879 and 1883, designing interiors for private residences and clubs as well as a curtain for a theater and the public rooms of an armory. Not only did the company work together to execute room decorations, but often the firm worked with other interior decorating businesses, such as Herter Brothers, within the same commissions. Specific rooms within a commission would be allocated to Associated Artists, while others were awarded to firms apparently in competition with them.

The two volume folio work, *Artistic Houses*, published 1883–84, covered some of the firm's most important commissions. This book not only illustrated some of their finest private interiors, but also detailed materials and color schemes. Other commissions completed by Associated Artists were described in monthly magazines and newspapers and heralded as some of the period's most creative and fashionable interiors.

Interiors by Associated Artists illustrated in *Artistic Houses* included Louis Comfort Tiffany's apartment; several rooms in the George Kemp house (1879), 720 Fifth Avenue; Hamilton Fish's drawing room, 251 East 17th Street; the drawing room in the John Taylor Johnston residence at 8 Fifth Avenue; and the dining room and parlor in the Dr. William T. Lusk house at 47 East 34th Street, all in New York. The firm also decorated the hall, library and parlor in the W.S. Kimball house in Rochester, New York, although only the hall and library were illustrated in *Artistic Houses*. Associated Artists had been selected by the new American president, Chester T. Arthur, to redecorate the White House's public rooms during the winter of 1882–83. A photograph of the East Room of the White House was reproduced in the book in addition to a detailed description of the firm's decoration of this room, the Blue

Room, the State Dining Room, the Red Room and the corridor linking these public rooms.

Two further interiors, mentioned in *Artistic Houses* as the work of Samuel Colman, may also have been part of the collaborative work of Associated Artists: Colman's own house in Newport, Rhode Island and the decoration of walls and ceilings for the Henry G. Marquand residence at 68th Street and Fifth Avenue, New York. The interior decoration of this last commission was directed by the artist, decorator and stained glass designer, John La Farge, and included work by La Farge, Colman, Frederic Leighton and Lawrence Alma-Tadema, indicating the close cooperation among artists of this period.

Other private commissions executed by Associated Artists included the main rooms on the first floor of Nook Farm (Hartford, Connecticut, 1881), the residence of Samuel L. Clemens, known more familiarly as the author Mark Twain. These lavish interiors are the only rooms from a private residence executed by Associated Artists to have survived *in situ*. The firm also executed the interiors for the Cornelius Vanderbilt II residence, 1 West 57th Street.

The stage or drop curtain at the Madison Square Theater, New York, completed in 1879, was Associated Artists' first public commission. The design, a realistic landscape executed in appliquéd velvet and silk, was adapted from a painting by Mrs. Oliver Wendell Holmes, Jr. Although the production of the curtain was primarily under the auspices of Wheeler, the other partners in the firm contributed their expertise: Tiffany directed the construction of the 90 yard long curtain, Colman oversaw the color and de Forest was in charge of the materials. Unfortunately, the curtain was destroyed in a fire soon after it was installed.

In 1879, the company was awarded the commission to decorate the Veterans' Room and the adjoining Library for the Seventh Regiment Armory (66th–67th Streets between Park and Lexington Avenues), an army regiment made up of volunteers from New York's highest levels of society. The decoration of the building was completed by New York's finest interior decorating firms, including Associated Artists, Herter Brothers, Pottier & Stymus, Alexander Roux, Kimbel & Cabus, and Marcotte & Co. The interiors executed by Associated Artists, which opened 26 April 1880, were decorated in an Aesthetic style, combining Greek, Moorish, Celtic, Egyptian, Persian and Japanese ornament with militaristic motifs, such as chain mail, shields and allegories of war. The architect Stanford White and the painters George Henry Yewell (1830–1923) and Frank Millet (1846–1912) also collaborated on the decoration with Associated Artists. These opulent and luxurious rooms are two of the very few interiors completed by Associated Artists still extant.

A third public commission was the decoration of the halls and grand staircase for the Union League Club (Fifth Avenue and 39th Street) in 1880. Once again, the firm was one of many decorating companies contracted to execute the interiors for this private men's club. Associated Artists also supplied the draperies for the main public rooms, including three dining rooms, a picture gallery and a meeting hall.

All four members of Associated Artists designed wallpapers and ceiling papers for the firm of Warren, Fuller and Company, New York. Papers designed by Tiffany and Colman served as illustrations for an essay written by the art critic Clarence

Cook for a promotional booklet published by Warren, Fuller and Company, titled *What Shall We Do with Our Walls?* In 1881 the wallpaper firm sponsored a competition for designs for wall and ceiling papers for which Christian Herter, Edward C. Moore and Francis Lathrop served as judges. Candace Wheeler won first prize and her daughter, Dora, fourth, while second and third prizes were won by two other women who worked for Associated Artists, Ida Clark and Caroline Townsend. Wallpaper designs by Associated Artists were noteworthy for their integration of motifs taken from nature.

The partnership of Associated Artists dissolved in 1883, as Tiffany and the others decided to pursue their own interests. Candace Wheeler retained the name Associated Artists for her own decorating firm, which was primarily concerned with the design and manufacture of textiles and wall and ceiling papers. Under Wheeler's direction, the firm produced textile patterns for cottons, silks, embroideries, and even printed denims and helped women find employment in the arts. Clients included Mrs. Potter Palmer, Andrew Carnegie and Lily Langtry. Wheeler also arranged a business relationship with Cheney Brothers of Hartford, Connecticut, a manufacturer of silks, to produce designs by Associated Artists. In 1907, when Candace Wheeler was 80 years old, she closed Associated Artists, the source of some of the most innovative and luxurious textile decorations in the United States.

Partnership of Louis Comfort Tiffany (1848–1933), Samuel Colman (1832–1920), Lockwood de Forest (1850–1932) and Candace Thurber Wheeler (1827–1923), established 1879; dissolved 1883. Name Associated Artists retained by Candace Wheeler for her own decorating firm; dissolved 1907.

Selected Works

Examples of the firm's work survive intact at the Mark Twain House, Hartford, Connecticut, and at the Seventh Regiment Armory, New York. Items designed by individual members of the firm are in the Metropolitan Museum of Art, New York. Many of their interiors are illustrated in *Artistic Houses*, 1883–84.

Interiors

- 1879 George Kemp House, New York (decoration and furnishings)
- 1879 Madison Square Theater, New York (embroidered stage curtain; mainly executed by Candace Wheeler)
- 1879–80 Veterans' Room and Library, 7th Regiment Armory, New York (decorations and furnishings, with Stanford White)
- 1880–81 Union League Club, New York (grand staircase and halls, and draperies for the main public rooms)
- 1881 William S. Kimball House, Rochester, New York (decorations and furniture)
- 1881 Mark Twain House, Hartford, Connecticut (decorations and furniture)
- 1881–82 Cornelius Vanderbilt II Mansion, New York (decorations and furniture)
- 1881–82 J. Taylor Johnson House, New York (decoration of the dining room)
- 1882–83 William T. Lusk House, New York (decoration of the dining room and parlour)
- 1882–83 The White House, Washington, DC (decoration of the public rooms, including the East Room, Blue Room, State

Dining Room and the Red Room): President Chester Arthur

Audran, Claude III 1658–1734

French decorative painter, *ornemaniste* and tapestry designer

Claude III Audran played a critical role in the evolution of French decorative style in the late 17th and early 18th centuries. He displayed an amazing talent for artistic interpretation, applying forms such as arabesques, grotesques, Chinoiserie and *singerie* to a wide range of interior features. His best-known works were wall paintings, executed in oil and fresco for the French royal residences, and tapestry designs for the Gobelins. Unfortunately, few of his executed works survive and the large collection of drawings, purchased from his studio by Count Cronstedt and now in the Nationalmuseum, Stockholm, was relatively unknown before the 1940s. As a result, his reputation was for many years overshadowed by those of his more famous contemporaries. Yet closer study of his designs, in particular the arabesques, has revealed a freedom from academic restraint lacking in the work of other *ornemanistes* and designers such as Jean I Berain. The gaiety, playfulness and fantasy inherent in Audran's designs became hallmarks of the Rococo style.

Born in Lyon, the son of an engraver, Audran was trained by his father and his uncles, Claude II and Gérard Audran. Claude II had worked as a decorative painter under Charles Le Brun at Versailles and Audran followed in this role arriving in Paris to complete his training by 1684. The second half of the 17th century had witnessed a resurgence of academic classicism and the French court was dominated by the work of Charles Le Brun, Pierre Lassurance and François Mansart, the

Audran: Gobelins tapestry, *June*, c.1700

chief purveyors of the French classical Baroque style. At the same time, however, a growing interest in less formal styles of architecture and design was signalled by Louis XIV's demand for a new, more "youthful" set of interiors for the *Ménagerie* at Versailles.

Audran's work was well suited to this new style. His arabesques were not dissimilar from those of contemporaries like Berain but the individual elements seemed to have broken free of spatial constraint and to float with immaterial lightness and often in apparent isolation. Yet the compositions were also balanced and ordered, using cardinal and diagonal axes and well-defined bordered fields. In addition to arabesques, his favourite motifs were dancers, musicians, actors and balladeers (he greatly admired the work of the Italian *Commedia dell'Arte*); imaginary creatures and deities such as fauns, sphinxes, and winged goats; natural animals and birds; mythological gods and goddesses; and baldacchini, trellises, and canopies which provided a loose structure for his compositions. By 1699 he had also begun to introduce monkeys mimicking human activities and Chinese figures (*singeries* and *Chinoiseries*), a move that prefigured their full-scale adoption by ornamentalists during the first decades of the next century.

Like Jean I Berain, Audran never visited Italy and his inspiration derived from French sources such as historic embroideries, grotesques, and garden design (*broderies*). His early training as an engraver encouraged the use of two-dimensional compositions frequently involving bandwork, interlacing and scrolls. This highly ornamental style was ideally suited to both architectural decoration and tapestry design and Audran was awarded the first commission from the Gobelins workshops after their re-opening in 1699. His most important interior commissions were for decorative paintings at the royal châteaux of Marly, Meudon, La Muette and la *Ménagerie* at Versailles. His *singeries* at Marly were particularly influential and owed much to the example of Berain. His tapestry designs included the *Portières des Dieux* (1699–1711), a suite containing grotesque ornament and figures by Louis de Boullogne which was so successful that it was still being woven by the Gobelins factory in 1780, the *Douze Mois Grotesques* (1707–08), and borders for Charles Antoine Coypel's *Don Quixote* series (1716–17). He also produced designs for furniture, ceramics, musical instruments, embroideries, carpets, stained glass, gondolas, sundials, church vestments and even fireworks. His talents were enormously versatile and when he received his professional title of *maître* in 1692, he was described as a painter, sculptor, engraver and *enjoliveur* or embellisher.

A great portion of Audran's decorative work was executed by his team of assistants and pupils, the most celebrated of whom was the painter Antoine Watteau (1684–1721) who worked with him from 1707 after Audran's appointment as curator of the Palais du Luxembourg. Audran also collaborated with several other painters and designers including Jean-Baptiste Oudry (1686–1755) and Christophe Huet (1700–59). With much of his decorative work now lost, the best record of his style survives in his drawings.

Audran's most important contribution to interior design relates to his fusion of architectural membering and surface decoration, and to his freeing of design from academic dictates. Contemporary architects such as Pierre Le Pautre were becoming

less and less interested in plasticity; columns began to disappear and pilasters were reduced to shallow strips. Walls became higher, ceilings flatter and doors and windows were integrated into the wall members so that decoration and function became indistinguishable. Wall compositions became a series of moving lines, fluttering on the surface as well as demonstrating the tension between the shallow three-dimensional ornament and the expanses of empty space on the wall. These compositions formed the perfect field for Audran and Berain's arabesques and naturalistic grotesque forms; exalted by their release from thickly-framed panels, these forms ran across and blended into borders and mouldings with a new freedom. This bold and innovative approach to decoration was an inspiration to the next generation of French artists and revealed possibilities that lay outside those dictated by their academic training. Audran's designs had "the relaxed, undidactic atmosphere of art that is free simply to be art: more bizarre than anything previously seen, deliberately not truthful, stirring neither patriotic nor moral strings, but beating drums for the sheer love of gaiety and noise" (Kalnein, 1995). Such work heralded the approach of the full-blown freedom of the Rococo.

MARGARET W. LICHTER

Biography

Born in Lyon, 25 August 1658, the son of the engraver Germain Audran (1631–1710). Taught by his father, and his uncles Claude II (1639–84) and Gérard (1640–1703). Working in Paris by 1684. Named Master Painter, Sculptor and Engraver, 1692. Active as a decorative painter in the Royal Palaces and worked at Anet (1698 and 1733), Versailles (from 1699), Fontainebleau (from 1703) and Marly (from 1704). Employed as a designer by the Gobelins tapestry factory from 1699 and was responsible for many notable tapestry series. Also designed stained glass, Savonnerie carpets (1711) and embroidery and church vestments. Appointed "intendant" at the Palais du Luxembourg, 1704; later set up his own tapestry factory there. Assisted by Antoine Watteau, 1707–09. Died in Paris, 27 May 1734.

Selected Works

Over 2000 drawings were acquired by the Swedish architect Carl Johan Cronstedt from Audran's estate; these are now in the Cronstedt collection in the Nationalmuseum, Stockholm. Additional designs and drawings are in the Cooper-Hewitt Museum, New York, and the Bibliothèque Nationale, the Louvre, and the Musée des Arts Décoratifs, Paris, which also contains Audran's ceiling from the Hôtel de Flesselles and panels from the Hôtel Peyrenc de Moras. Examples of Audran's tapestries are in the Mobilier National, Paris.

Interiors

- 1698 & 1733 Château d'Anet (painted decoration in the salon, grand cabinet, cabinet des muses, and cabinet des singes): Duc de Vendôme
- 1699 Versailles (petit chambre de Madame le Princesse de Conti)
- c.1699 & 1708–09 Château Neuf, Meudon (decorations including various ceilings, and the Dauphin's apartment): Grand Dauphin
- 1699–1701 Château de la *Ménagerie*, Versailles (decoration of the apartment of the Duchesse de Bourgogne)
- 1703–32 Château de Fontainebleau (decorations)
- 1704–32 Château de Marly (*singeries*)
- 1704 Château de Sceaux (decoration of the apartment of the Duchesse du Maine)
- 1716–32 Palais du Luxembourg, Paris (decorations)
- 1720–32 Château de la Muette (decorations)

- 1723 Hôtel Angran de Fonspertius, Paris (decorations)
 c.1724 Hôtel Peyrenc de Moras, Paris (decoration and panels of the Cabinet; with Nicolas Lancret)

Audran's tapestries included the *Portières de Dieux* (c.1699–1711), *Douze Mois Grotesques par Bandes* (1707–08), and borders for C. A. Coppel's *Don Quixote* series (1716–17).

Australia

Whatever Britain's inchoate plans for the penal settlement of New South Wales in 1788, interiors in a European mould were envisaged, since Governor Arthur Phillip arrived in Sydney with a five-roomed oilcloth house, campaign furniture, crown glass and a portrait of Her Royal Highness the Duchess of Cumberland. Necessity and economy determined, however, that by 1796 "most of the comforts and not a few of the luxuries of life" had resulted from "communication with India and other parts of the world" (quoted in Serle, 1993). Robert Campbell, who represented an East India Company "house of agency", enjoyed "the parade and luxury of the eastern style of living" in his harbourside house in 1798 (quoted in Serle 1993). Until trading sanctions were introduced, India was a major source of household furnishings. Between 1810 and 1820 the market was glutted with goods including palampores,

chintz and calico. Anglo-Indian furniture often appeared in the homes of settlers who had served in India: the quintessential example of Indian influence is Horsley, a cross-ventilated, verandahed bungalow built in the 1830s equipped with teak joinery, Regency dining chairs of Indian timber, a punkah and Indian servants. Besides importing Indian goods, enterprising colonists circumvented an embargo on trade with China to bring in ceramics, lacquerware and paperhangings adapted for the Western market, although their popularity was waning in Europe.

These chance Eastern imports and the appearance of American furnishings, sold by traders and whalers, do not obscure the fact that the first and subsequent migrants to both New South Wales and later settlements felt an urge to recreate the interiors they had known at home. Rare surviving pieces of colonial furniture and descriptions of interiors suggest that, whether imported or locally made, furniture of late Georgian design predominated in well-to-do colonial houses. Textiles were imported, as the finest still are today. 1800 saw the arrival of the first Governor's Lady, portraits of George IV and Queen Charlotte, fitted carpets and blue sprigged Spode teacups in Government House.

With the release of land – the traditional basis of status in society – to officers and civil servants, houses and their interiors grew more sophisticated. By 1812 the *Sydney Gazette* thought it relevant to satirize Neo-Classical decoration: "In the frame of a fashionable mirror, a crocodile watches; a companionable tiger crouches on a hearthrug; a sphynx supports us on a couch, and serpents twine round bedposts." Epitomizing such progress was Henrietta Villa, begun in 1816 by Captain John Piper, who was, according to the *Sydney Gazette* of 1823, "the most furnished and fashionable Corinthian in the colony". Piper's Neo-Classical interiors owed much to Sir John Soane, and sparse records point to chintzes, moreen, brass-inlaid furniture, mandarins with nodding heads and silver bought of George Purse, The Strand.

Disseminated in architectural pattern books, published designs for furniture and furnishings or via C.F. Bielefield's prefabricated *papier-mâché* mouldings, Greek Revival styles had a long run in Australia as they did in provincial Britain. John Taylor's *The Upholsterer's and Cabinet Maker's Pocket Assistant* (c.1825), George Smith's *The Cabinet-Maker, & Upholsterer's Guide* (1826) and J.C. Loudon's *Encyclopaedia of Cottage, Farm and Villa Architecture* (1833) are documented in the colony; Grecian sofas and tables were advertised for sale in the mid-1820s and descriptions of fashionable households focus on Greek Revival furniture, suggesting it was still in the vanguard of colonial fashion in the 1830s. There were English mahogany Grecian couches in the modest Government House and in the Grecian villas built by the civil establishment on fashionable Woolloomooloo Hill in that decade. As late as 1846 a Hobart cabinet-maker was offering to decorate after the "most approved Grecian" style as well as the much more fashionable "Parisian taste".

There was little consistency in architecture, decoration and furnishings, and Greek Revival furniture co-habited happily with "Louis" and Gothic Revival pieces, as well as with appealing locally-made mongrels. Regency and William IV designs gradually overtook Georgian ones, and inevitably former styles merged with early Victorian ones as furniture

Australia: Dome Room, Henrietta Villa, Sydney, c.1844; watercolour by Frederick Garling, Jr. (Mitchell Library, State Library of New South Wales)

thickened up and moved out from the walls as it did in British interiors.

Most settlers were groping towards an elegance they but dimly understood, and, while anxious to keep abreast of metropolitan, and largely English fashion, judged interiors in terms of what was reasonable in "this country at this stage of its existence" (G. Barrington, quoted in J. Copley, *Sydney Cove 1791–1792*, Sydney, 1965). Nonetheless any interior could be annihilated with the words "It's quite colonial". Australia had no aristocratic class and was a small, socially and economically mobile society. The aspirant middle classes had mostly migrated to better themselves. They were not prodigiously rich. Almost everything was new and lacked patina as it did in the houses of Britain's new middle classes. Adelaide, settled in 1836, was later described as "a book one had never opened before, startling and new" (Douglas Pike, *Paradise of Dissent: South Australia, 1829–1857*, 2nd edition Melbourne: Cambridge University Press, 1967).

Isolation from the sources of supply made building and homemaking an unwieldy operation. Even relatively long-established families were sometimes slow to bother with curtains and carpets – their incomes, the climate and moths all

played a part. When the depression of the 1840s struck, many interiors created in the prosperous 1830s were devastated. The collapse of a market dependent on a single staple, wool, and the cessation of transportation to the eastern colonies were both blamed, as household goods became "old acquaintances bought and sold twenty times over" (G.C. Mundy, *Our Antipodes*, London, 1852). Apart from a few outbreaks of short-lived grandeur, most of the interiors of respectable colonists at this time had much in common with the middle-class rooms recorded in England by Mary Ellen Best. New arrivals commented on their Englishness and overstuffedness and the non-observance of normal practice in hot countries. Amid the panic and promissory notes, Rococo Revival joined the Gothic Revival style, the latter receiving a fillip when adopted for a vice-regal residence.

As a result of official parsimony and competing calls on funds, it took roughly half a century for permanent Government Houses to appear in New South Wales, Tasmania and Western Australia. In the interim governors often lagged behind successful settlers in their domestic appointments and ability to influence public taste. This changed when three very different buildings appeared under the "Tudor Gothic"

Australia: Legislative Council Chamber, Parliament House, Melbourne, c.1856 (La Trobe Picture Collection, State Library of Victoria)

banner in Sydney (1837–45), Hobart (1854–58) and Perth (1859–62). Picturesque Gothic had been popular in vice-regal circles in the second decade of the century and the Gothic Revival's association with power and prestige provided the authority needed in a remote dependency – as the *Colonial Architect* remarked, “No style can have grander effect”. Besides grandeur, these buildings had a backbone of official furniture, although changes of governors, who varied greatly in wealth, taste and personal chattels, constantly affected their interiors.

In Government House, Sydney, Edward Blore, architect to William IV and of Sir Walter Scott's Abbotsford, provided strong neo-Gothic detailing in the hall but less evidence of the style elsewhere. New South Wales being well established and in a depression, most furniture was acquired locally. An “Elizabethan” hall table and chairs were copied from Loudon

and Neo-Classical rosewood drawing room furniture was purchased from the impoverished Colonial Secretary.

In Hobart the Government Architect, William Porden Kay, son of architect and decorator, Joseph Kay, and grandson of architect, William Porden, designed Government House and successfully argued for imported decorative schemes in all the public rooms. As a result Hobart's interiors were pure transplantations of British Establishment taste. While abroad in 1853 Kay was authorized to spend upwards of £2000 “on articles required in the completion and decoration of the building”. These probably included the mouldings which reinforced the neo-Gothic character of the state interiors, including the dining room where the ceiling was coffered and stencilled with quarterings from the royal standard. The schemes for the main rooms (the panelled 18th century-style library failed to materialize), which were executed by a convict craftsman at a cost of

£823 almost certainly came from Messrs Trollope and Sons of Parliament Street, London. Trollope also provided £6126.15.6 worth of furniture including pairs of Boulle cabinets, Rococo overmantel mirrors and seat furniture for the drawing room. Puginesque pieces, including gasoliers for the dining room and ballroom were also acquired, and Rococo Revival chimney-pieces supplanted those originally recommended.

Captain E. Y. W. Henderson, who designed Government House, Perth, had good contacts in England and was said to be a friend of Sir Charles Barry, architect of the Houses of Parliament, Westminster. He went to J. G. Crace, the fashionable London decorator who had worked with A. W. N. Pugin on the Houses of Parliament and now marketed Pugin's designs. Crace provided the actual ceilings for the hall (with coats of arms of the kings and queens of England), drawing room and dining room, Pugin wallpapers and one or more Pugin carpets. Chimneypieces, tiles, grates, fenders and hall lamp standards helped sustain the Gothic Revival character of the building internally, despite a Rococo Revival overmantel mirror, an 18th century French style chandelier and the inevitable cabriole-legged seat furniture in the drawing room.

Reverting to chronology, the late 1840s reveals that the various colonial economies were recovering, the future colony of Victoria was being settled and a new generation was taking the reins. 1851 was a watershed year. The discovery of gold in Victoria transformed Australia: the population increased dramatically, transportation of convicts ceased (except to Western Australia), new opportunities appeared as did a wealth of craftsmen who worked first on the public buildings being erected in the colony and later in the houses of those wishing to parade their success. Outstanding among public interiors was the Legislative Council Chamber in Parliament House, Melbourne (c.1856), designed by Peter Kerr, who had worked with Barry. Sculpture and architecture are fused in this monumental Corinthian interior, rich with symbols of Government derived from Roman antiquity.

Those who had come "before the gold" tended to look askance at the brash exuberance of new arrivals, but Louisa Anne Meredith who published an account of her visit to Victoria in 1861, was near the mark in saying that "the elegancies and refinements of civilized life are as well understood by the better classes in Victoria, as in Royal Victoria's loyal city itself; with perhaps a tint or two more of show, where the wealth of today is not the ancestral characteristic of the family, and the recent gilding is not toned down."

1851 proved a milestone in another way. A number of influential Australians marvelled at the Great Exhibition; they saw the triumphs of the Industrial Revolution it displayed and then returned to interpret the current fashion for Rococo Revival in their own way. Seduced by the Medieval Court at the Exhibition, Thomas Mort spent most of the 1850s transforming Greenoakes, Darling Point, into a "Gothic" building under Sydney's new architectural luminary, Edmund Blacket. Mort patronized at least four firms showing at the Great Exhibition: windows containing portraits of the Tudor kings and queens came from Hardmans of Birmingham; generous *carton pierre* mouldings for drawing room, dining room, library and corridor from George Jackson & Sons of London; M. Potts of Birmingham supplied neo-Gothic oak furniture, and Elkingtons furnished bronze casts. Greenoakes' hall, leading to

the picture gallery, contained "ancient implements of war, representing with tolerable completeness the armour used by the English in olden time". Some of these relics, which included a valuable Italian 16th-century silver-inlaid suit of armour, were purchased by Mort in 1857 at the sale of the collection of the Earls of Shrewsbury at Alton Towers. A Pugin paper and a carving attributed to Grinling Gibbons contributed to interiors described as "quite old fashioned" and Elizabethan-looking seven years later.

Agents with London offices, particularly those involved in the pastoral industry, had long been buying furnishings for colonists, and in the wake of gold the practice grew: in 1859 Frederick Dalgety fitted out John Moffatt's Chatsworth House, the first of the Victorian "Bush Palaces" completely equipped from London. Everything from the *Encyclopaedia Britannica* to Alexis Soyer's cooking apparatus and patty pans was imported, with William Smee & Sons, rather than one of the "crack West End firms" or the "Cormorants of the Fashionable circle", supplying the furniture. Thus a shepherd who had started on £23 a year entertained Australia's first royal visitor, the Duke of Edinburgh, in 1867. Adequate bathrooms and plumbing determined who got the nod.

Most colonists stuck rigidly to the mid-century rules which dictated which woods appeared in which rooms and how furniture was arranged. Drawing rooms were focussed either on a central ottoman or a table on which objects were arranged radially around a vase of flowers, with an inner ring of chairs from a matched suite drawn up to take advantage of the source of light. At Mona Vale, Tasmania, the drawing room walls were hung with a rich *moiré* antique paper, in white and gold, the furniture was uniform throughout, the wood rosewood, the upholstery scarlet rep. Whether scarlet or the more popular grass green, glaring upholstery, produced with the virulent new aniline dyes, was frequently combined with floral, foliate, striped, diapered, flocked or watered wallpapers and exuberant Brussels and Axminster carpets to create boldly patterned interiors.

The 1870s and 1880s saw the proliferation of grand houses in both town and country especially in gold-rich Victoria. The absence of major buildings seems to have kindled a passion for building in some colonists who had associated with the landed gentry in Britain and were keen to ornament their estates with houses redolent of ancient lineage and future dynasties. Anthony Trollope felt there was rarely "all the finished comfort, the easy grace coming from long habit" which distinguished country seats at Home. Though the likeness was there it existed with a difference.

At Werribee Park, Victoria, Thomas Chirnside demonstrated his apparent wealth and social standing in a two-storey Italianate mansion filled with 58 cases of furniture supplied by John Taylor & Son of Edinburgh in 1875 and augmented with a collection of Old Master paintings purchased from Christie's in 1881. His statuary included marble busts of the Prince and Princess of Wales by the English sculptor Marshall Wood, who had executed an over-lifesized statue of Queen Victoria for Parliament House, Melbourne. The identity of Werribee's decorator is unknown but the predominantly pale blue and gold decoration is reminiscent of the restrained schemes supplied shortly before by Jackson & Graham for Government House, Melbourne.

Australia: drawing room, Torrens Park, Adelaide, late 19th century (Mortlock Library of South Australiana, State Library of South Australia)

As in Tasmania, William Wardell, the architect of Government House, Melbourne, favoured placing the decoration and furnishing of the vast Italianate building in the hands of a well-established London firm, who could send out its own craftsmen: in fact "adopt the course most private persons take when they require the best class of furniture" (Lane and Serle, 1990). In the consequent uproar over the work going abroad, Jackson & Graham's schemes were shelved and only carpets and limited items of furniture were imported. High quality pieces in colonial woods were supplied by George Thwaites and James McEwan & Co., much to the chagrin of W.H. Rocke & Co., who started the furore. The furnishings having cost £30,000, the walls remained white for thirteen years. Living there later and freezing to death, Lady Tennyson described the building as "an enormous smart hotel", a "small Buckingham Palace" and "even bigger than India".

Whether it came from Wigmore Street or High Wycombe, imported furniture had lasting cachet, which resulted in Australian interiors becoming increasingly Europeanized, a fact borne out by figures for furniture exported to Australia. Henry Cooper, Filmer & Sons, Gillow & Co., Maple & Co.,

Saul Moss & Sons of Manchester, Sadgrove & Co., James Shoolbred & Co., William Smee & Sons, William Walker & Sons, together with Copelands, Jeffrey & Co., Hoock Frères of Paris, Minton & Co., and Daniel Walters were among those called upon as ambitious Australians trawled in fairly uncharted waters. Some combined decorating their interiors with a trip abroad and a visit to the Continent and went armed with advice from those who had preceded them. William Clarke, son of the largest landowner in Victoria, saved himself the trouble by patronizing Rocke and employed Schemmel & Shilton to decorate the interior of Rupertswood, his country seat near Sunbury in 1875.

Exhibitions, following the 1851 model, played an important role in interiors in the second half of the century and helped relay to colonists the dictates of new movements, in particular the Aesthetic Movement. While largely isolated from the intellectual ferment which ushered in Aestheticism and Art furnishing overseas, Australians were not in total purdah: Daniel Cottier established a branch of his firm in both New York and Sydney in 1873, with John Lamb Lyon as local manager. In 1875 visitors to the Melbourne Inter-colonial Exhibition (a dry

Australia: hall, Werribee Park; watercolour by A.C. Cooke, 1878

run for the Philadelphia Exhibition) were stunned by the “blaze of colour, the sheen of gold, the brilliancy of lacquer, the delicacy of enamel” in the Japanese exhibit, which occupied an entire gallery, and in 1878 a large shipment of Japanese works of art brought extravagant prices in Sydney. The Melbourne Exhibition of 1880 was said to have introduced Aestheticism and Artistic furnishing to the public at large. It certainly brought Oriental wares and household goods designed and / or decorated in a loosely Oriental manner to the attention of a large cross-section of society: lacquerware, a pair of cloisonné enamel jars, Oriental-inspired wallpapers and carpets, and porcelain and art pottery by Minton, Wedgwood, Royal Worcester, Doultons, Bretby and Brownfields were all on view.

Aestheticism had in fact already received the seal of approval in Melbourne at Joseph’s Clarke’s Mandeville Hall: begun in 1878, the year in which Thomas Jeckyll and Whistler’s Peacock Room was completed, the decoration of Mandeville’s interiors occupied Mr East from Gillow & Co. of London for a year. The decoration of the segmented drawing room ceiling was carried out in sage, salmon, buff and gold, and the walls were hung with an olive green silk designed by

Bruce Talbert, above and below which was a frieze of silk and velvet embroidery and a dado of rose silken plush. The furniture was of satinwood and the floor was laid with a camel hair Persian rug. In the dining room the ceiling was panelled in oak and gold, and beneath a frieze depicting sporting scenes the walls were covered with richly-stamped leather. A massive oak chimneypiece was set with tiles and the silk curtains had dados and friezes of Utrecht velvet. The morning room, presented with some stylistic licence as an Indian room, embraced the fashion for exotic interiors.

The 1880s were an extravagant decade, with furniture warehousemen, decorators and leading stores such as David Jones of Sydney all strutting their stuff and offering pacesetters and others a wealth of Art Furnishings and Revival styles. Typical was William Cullis Hill of Melbourne, who, after training with Rocke, went out on his own and was soon informing “the patrician orders”, via the *Melbourne Bulletin* of 1885, that they were Gillow’s Australian agent and that “henceforth new designs would be released simultaneously in London and Melbourne”. Cullis Hill, who mixed Oriental and Occidental furnishings promiscuously in his own interiors and,

like many decorators, involved fine artists in his work, advocated a range of styles in a promotional juggling act. While invoking the names of Morris, Ruskin and Pater and writing piously of Old English, Queen Anne and fitness for purpose, he unblushingly recommended Louis-Quatorze, that "earthly paradise of ormolu". He advertised Art furniture, including pieces made to E.W. Godwin's designs, and employed about 80 workmen, including craftsmen brought out for the 1880 Exhibition, to produce Jacobean, Chippendale, Queen Anne or anything the public had a fancy for. A portière, a Persian rug, a furlong of Liberty silk or a suite in which every chair was of a different shape, size and colour were all within his grasp. W.H. Rocke & Co., who had long been scouring the fashion capitals of the world and offered a lavish promotional brochure, assumed an Aesthetic stance in 1880 with an advertisement lifted either from Mrs Orrinsmith's *The Drawing-Room* (London, 1877) or from the American Clarence Cook's *The House Beautiful* (1878).

In the 1880s Melbourne and Sydney swarmed with decorators: Paterson Brothers, who demonstrated their talents in the interior of the Exhibition Building in 1875 and in the library of Parliament House, Melbourne, and executed 14 by 40 foot murals of Sydney Harbour and Edinburgh during a romanticizing exercise at Villa Alba, Kew, about 1883, could boast that Hugh Paterson had trained with one Cornelius, described as a famous Scottish art decorator. While abroad in 1886 he had caught up with the most advanced taste and become acquainted with William Morris, Frederic Leighton, Walter Crane and many leading painters, decorators and scenic artists. Following this bout of self-promotion Paterson Brothers, together with S.W. Mouncey, were commissioned to introduce "the soft tints and faint colourings of artistic decoration" to Government House, Melbourne, in anticipation of the arrival of Lord and Lady Hopetoun in 1889. Lyon, Cottier & Co. was responsible for the new Aesthetic mural and ceiling decorations in Government House, Sydney and for major work at Cranbrook, Glanworth, Ginnagullah and Woollahra House, although Cottier had "banished all the Japanese stuff he used to be so fond of" by 1886. In the late 1880s Scottish-trained Andrew Wells was the firm's representative when the headquarters and residential suite of the English, Scottish and Australian bank in Melbourne were transformed into Australia's finest Gothic Revival interiors. America was represented among Art decorators by J. Clay Beeler, who trained at the Cooper Union art school. He was almost certainly responsible for the outstanding Aesthetic textiles and Eastlake sideboard at Mount Rothwell, Victoria, and was a member of the Society of Decorators and Painters established in 1904.

Maurice B. Adams, the designer of Bedford Park, was one English Queen Anne revival architect with an Australian clientele: when Charles Fairfax commissioned him to enhance a Sydney architect's design for Caerleon in the "Old English" style in the mid-1880s he ruffled local feathers, although a deferential press dubbed the style "New South Jacobean" and thought the result "as Australian as Riverina mutton".

While some colonists who had only recently created mid-Victorian interiors lay on their oars, the majority added at least a superficial Artistic overlay to conventional rooms and ignored Morris's call to make a bonfire of nine-tenths of what they owned. From the 1880s however, avant-garde architects

were fretting about bows, rosettes, bandages, register grates and over-upholstered, unnavigable interiors. Added to this, well-to-do Australians were beginning to face the fact that they were not, and never would be, in the same league as the Devonshires, Astors, Fricks, Pierpont Morgans and Vanderbilts. Reeling from the depression of the 1890s and the recent imposition of land taxes and death duties, and feeling the results of the common lack of entail, they aligned their aspirations more closely with economic reality. This fortunately coincided with a growing concern for simplicity and fitness for purpose, which had its roots in the Arts and Crafts and "Health" movements and overlapped with growing nationalism and the limp, local version of Art Nouveau.

All styles were not equally pervasive: the vogue for Morris interiors in the 1880s and 1890s was most marked in South Australia where town and country houses of Robert and Joanna Barr Smith assimilated vast quantities of Morris goods. These houses are unique in the history of interior decoration in Australia for their wealth of Morris wallpapers and textiles, de Morgan tiles and Chinese export porcelain and for the fact that Morris himself, as well as W. Neville Ashbee, advised on their ever-changing interiors.

Morris's more central interest, the Arts & Crafts Movement, found expression in houses with face brick walls, high panelled dados, deep friezes and white plasterwork combined with ceilings supported on heavy bracketed beams. Native timbers were used for flooring and joinery, bays and inglenooks abounded, leather seats fixed by wrought iron nails were obligatory as was craftwork of variable quality. White, cream, blue, grey, purple and mauve dominated a limited palette. Some patronized Kosmic Co.'s "Liberty Rooms" in Sydney where Liberty wares shared space with local furnishings inspired by imported prototypes. Later Morris & Co.'s and Gustav Stickley's commercial ranges were available. Booloominbah, New South Wales, designed by the American-trained Horbury Hunt, was one of the more robust essays in Arts and Crafts, with interiors decorated by Lyon, Cottier and Co. displaying a wealth of indigenous motifs.

With nationhood about to become a reality, there were calls for Australian styles of decoration and a national school of decorative arts. Although his designs remained unpublished, Lucien Henri, the brilliant Frenchman who taught in Sydney during the 1880s, fostered the use of Australian motifs in decoration and produced a folio of plates in which flora and fauna were adapted to architecture and the applied arts. Ernest Wunderlich's embossed metal sheeting, patented in 1888 and decorated with Art Nouveau versions of national emblems actually introduced nationalism and hygienic surfaces into a wide cross-section of interiors. About 1903, at Purrumbete, Victoria, W.T. Manifold celebrated his pioneering forebears in a series of Art Nouveau murals which dominate the panelled open-plan living hall. There, Guyon Purchas expressed the most advanced architectural thought of the day and used local timber in carved newel posts and a screen beneath the minstrels' gallery; the furniture was by Liberty's.

The difficulty of creating distinctively Australian interiors in a country with such a short tradition was acknowledged, with many architects looking to America for models, as they have done ever since. American Romanesque interiors, featuring bespindled screens and round headed arches, and open-

Australia: drawing room, Government House, Hobart; mixed media drawing by H. Willson, 1856 (Tasmanian Museum and Art Gallery)

planned American bungalows were both gaining ground around the turn of the century, with some describing them as “almost” Australian. The expatriate Briton, John Sulman, argued, however, that neither England nor other nations were relevant to Australia – “we are just ourselves”.

A growing sense of the country’s history and an aversion to “groping among the ruins of Elizabethan and Queen Anne styles”, as one authority put the case in 1890, for models for antipodean houses in the 20th century led some Australians back to their beginnings, and to Georgian interiors. Chief among them was the architect, William Hardy Wilson, who thought good taste had come to an end in 1820. He achieved the effect he wanted with Georgian-style joinery, panelling, parquet floors of Australian timbers and with 17th- and 18th-century furniture ranged against plain walls. In his view such interiors were a step towards a harmonious, modern style of living and his expensive version of “good taste” has had a loyal following in conservative quarters ever since.

Wilson’s ideas did not appeal to everyone: early this century Sir Rupert Clarke endorsed the overseas move towards flats when he moved into a new apartment in central Melbourne decorated in the Moorish style. Dame Nellie Melba, who returned shortly before World War I to transplant the informal elegance of the Edwardian English country house to Coombe Cottage, near Lilydale, Victoria, was more relaxed than Wilson: contributing to her electrically-lit, panelled music room was a Gothic fireplace, paintwork in two shades of green, a parquet floor, antique and reproduction furniture, an American grand piano and two sets of glazed chintz curtains and slip covers made in London.

Interior design and decoration was inhibited by the war, and

the move towards simpler, healthier, more rational interiors was slow in the first two decades of the century: it was almost as if Australians had lost their nerve along with their money. By the 1920s Georgian Revival interiors, with their concomitant of antiques, seemed a safe investment and dominated Establishment houses until after World War II, in spite of architects like Robert Haddon and Harold Desbrowe Annear who were recommending open planning, built-in furniture, simplicity and restraint.

Sometimes it was an advantage to be an outsider. Walter Burley Griffin and his wife, the former Marion Mahony, who had previously worked with Frank Lloyd Wright, arrived from America in 1914 after winning the competition for the design of Canberra. A product of the Prairie School, Griffin attacked the lingering “mildew of mediaevalism” (Johnson 1977), put forward radical ideas and looked to nature and the landscape for inspiration. Their mature work included world-class interiors. The Café Australia, Melbourne (1915–16) – the country’s first proto-modern interior – was an inspired amalgam, demonstrating their superb handling of space and concealed lighting as well as an ability to design all elements, including furniture and tablewares. The Capitol Theatre (1921–24) showed an imagination fired by the prismatic reflection of light on crystalline formations: cubes, triangles and stalactites of plaster concealed the mechanics of an ever-changing play of light in the main pillarless auditorium, which contrasted with the vaulted, cavernous lobby. The Capitol stood apart from Australia’s later run of Hollywood-style theatres. The Griffins were also responsible for Newman College, Melbourne, including its furniture.

Late in the 1920s, after the 1925 Paris Exposition intro-

duced a wide audience to Art Deco, Sydney Ure Smith's chic journal the *Home* (first published 1920) published the unflattering comments of some leading Sydneysiders on the continuing popularity of clutter, "Mission", fumed oak, "Jacobean", aspidistras, palms, spring roller blinds, panelled wallpapers, plate rails and other survivals. The *Home* continued to keep architects, fine artists, designers and the artistically-aware abreast of international fashion by publishing illustrations culled from the *Studio* and *Decorative Art* of interiors in London, Paris and New York. The occasional sub-Elsie de Wolfe or Syrie Maugham white-to-grey interior appearing locally was probably the result of such influences. Officialdom was unadventurous when fitting out Yarralumla, Canberra, in this decade to serve as the nation's premier vice-regal residence: directed to buy "first quality British", the "lady decorator", Ruth Lane-Poole, used local timbers although her purchases were mainly Georgian "Repro". More exciting were streamlined moderne interiors, which those who travelled could absorb on luxury liners.

Late in 1929, the year in which the Metropolitan Museum mounted an exhibition of modern decorative arts, based on the Paris model and planned by Eliel Saarinen, the *Home* announced that Modernism had reached Australia and heralded an interior containing furniture by DIM of Paris in "Pallisandre Verni" as Melbourne's first example of the style. Two months later a group of artists, led by Roy de Maistre, mounted a modest exhibition at Burdekin House, Sydney. Room settings with furniture based on Continental designs or adaptations of them were shown by de Maistre, Thea Proctor, Hera Roberts, Adrian Feint and Leon Gellert. Designs were based on the prism, cylinder, sphere, cone, cube and pyramid, preferred colours included ivory, grey, blue, black and yellow combined with judiciously chosen strong colours. The stress was on simplicity, functionalism and natural timbers, although painted furniture, with its long Arts and Crafts lineage, was also prominent.

In 1932 Paul Staal, Consul-General for the Netherlands, and his wife, Amelia, introduced what was probably the country's first full-blown collection of Modern European furniture to Sydney's diplomatic circuit and to readers of the *Home*. Their conventional house on Bellevue Hill was filled with steel and black wood furniture designed by Marcel Breuer and made by Thonet, Swedish glass light fittings by Giso of Rotterdam, a silver and ebony tea service by Begeer of Holland designed for the Wiener Werkstätte, and modern rugs and Dutch paintings. Marcel Breuer's Cesca cantilever chairs were covered with blue canvas.

Minimal migration, cosy complacency and the depression of the 1930s inhibited a general move towards Modernism although the ardent Melbourne Modernist, Robin Boyd, was later to say that the back-to-basics economy of the 1930s encouraged simplicity and functionalism. According to Boyd, students and young architects had converted to Modernism and Functionalism by 1934. Roy Grounds had begun designing functional interiors with built-in fitments which excluded many previously essential pieces of free-standing furniture and was also specifying copies of overseas furniture designs. Local designers were active, with Melbourne decorator Cynthia Reed offering modern craftwork, fabrics by Frances Burke and unstained, waxed furniture designed by the artist Sam Atyeo or

by Frederick Ward, who later worked for Myers, a major department store. In 1933 Reed, Ward and Michael O'Connell showed furniture and handprinted hangings at an exhibition of British contemporary art sponsored by Keith Murdoch of the Melbourne *Herald*.

By 1935 the well-connected Marion Hall Best, "who studied with Proctor and had a hatred of cream, beige and porridge", caught the attention of the *Home* with an interior which included modern Sundour cretonne curtains, a Marion Dorn rug and a Franz Marc print. Then at the beginning of a long decorating / designing career, which covered importing, commissioning, marketing and promoting, Best studied first-year architecture, took a year-long course in interior decoration from New York and, on the eve of war, launched her own business in Sydney. She contributed a "Young Modern" and "Classic Modern" interior to David Jones's exhibition entitled "An Englishman's Home 1700-1941". Hampered by wartime shortages, she manufactured textiles and used designs by her sister, Doris Sweetapple, and others, together with furniture designed by Clement Meadmore.

The traditionalist Deric Deane had seen to the needs of Sydney's conservative enclave during the 1930s, and in the 1940s he was joined by Molly Gray, Merle de Boulay and Stuart Lowe. In Melbourne Reg Riddell served a similar clientele for many years as did the "lady decorator", Dolly Guy Smith. In 1949, the *Australian Home Beautiful* ran a major article on modern American home designs which anticipated how American styling would become synonymous with modernity. Peace gave impetus to interior decoration despite shortages and regulations. In the late 1940s the Hungarian architect, Steven Kalmar, began business selling custom-designed modern furniture and Dr. George Molnar opened Artes studios in Sydney.

The arrival in Sydney in 1948 of Viennese-born Harry Seidler, who had studied in America under Walter Gropius and Josef Albers and worked with Marcel Breuer in New York, consolidated the influence of Modernism. In the small Rose Seidler house (c.1950) open-planning, flexible subdivision of space, a lavish use of glass window walls, neutral colours contrasted with strong colour accents, a mural by the architect, and a sophisticated kitchen contributed to Seidler's "total sculpture". The furniture was from Herman Miller and Knoll International of New York or designed by Seidler and built by fellow Viennese craftsman, Paul Kafka. The chairs were by Charles Eames, Eero Saarinen and Hardoy. Family treasures, which were to enrich many houses of European post-war migrants, were banned by Seidler with the exception of ornate silver cutlery and tea services.

Post-war optimism brought faster change: following a trip abroad and exposure to modern theatre design, Best mounted an exhibition called "A Walk Through Europe" in her Woollahra studio. In Melbourne in 1949, the English-trained designer R. Haughton James, who had begun his crusade on behalf of good modern design a decade earlier in Sydney, organized a modern home exhibition. He enlisted Robin Boyd, whose "House of Tomorrow" gave the public their first close encounter with contemporary interiors, displaying furniture by Grant Featherston and showing great concern for functional lighting. James, Featherston and Joseph Burke, the Englishman recently appointed to the Melbourne Chair of Fine Arts, were

Australia: showroom of Marion Hall Best, c.1960 (Historic Houses Trust of New South Wales)

also active in the establishment of design bodies including the Society of Designers in Industry, which later joined with the Sydney Interior Design Association to form the Industrial Design Council of Australia. The Society of Interior Designers of Australia was formed in 1951 and by the 1960s schools of interior design and decoration were functioning. A foundation member of the Designers was Margaret Lord, who had worked in London before the war and wrote *Interior Decoration*, (Sydney 1944) which ran to four editions. Modern designers working for a mass market in the 1950s, some of whom have already been mentioned, included Gordon Andrews, Lester Bunbury and Douglas Snelling. Austrian cabinet-maker

Schulim Krimper was producing superb hand-crafted pieces; hand-woven textiles were being made by the Sturt Workshops at Mittagong, New South Wales and by Eclarté, a Victorian firm which went to the landscape for colours and textures; and Florence Broadhurst was designing handprinted wallpapers.

Modernism had more than one face: Best, who made trips to Milan (1954), Japan (1957) and India and patronized Knoll International, assembled eclectic interiors using the world's finest products. But, for her, Modernism was essentially colour, large scale motifs from firms like the Scandinavian company Marimekko, shimmering oriental silks, lacquered rattan blinds, and brilliantly glazed walls, in contrast to interiors

designed by many modern architects such as Boyd, whose mature work favoured non-featurism and pale, often limed timbers. Despite the different accent, Best was one of the few interior designers whom architects were able to work with – she spoke their language.

Although heavily reliant on American and European models, local furniture designers were forced to be innovative in the 1950s and early 1960s since the small local industry lacked the latest overseas technology. Furniture by leading overseas designers such as Breuer, Le Corbusier, Mies van der Rohe and Hans Wegner was available as licensed copies or near-plagiarized pieces. Scandinavian imports first appeared in minor outlets such as Guests of Melbourne and were later taken up by the big department stores. Danish Deluxe and Mobler were competing increasingly with local designers and Japan was attracting great interest, with Andersons of Melbourne a major outlet in the 1960s. When it came to public interiors Joern Utzon's inspired Opera House fell a victim to local mediocrity.

As Modernism faltered there was a lack of clear new directions. French-trained Leslie Walford was adding Gallic verve to Sydney's traditional interiors, and in Melbourne Riddell still held sway. The disillusioned turned again to revivals and romanticism and Australia was a prime market for overseas firms reproducing 19th-century wallpapers. This new historicism has resulted in academically correct conservation / restoration; an imaginative high-style Aesthetic decoration; and a rampant outbreak of nostalgia emanating from Laura Ashley's numerous outlets since 1977. Postmodernism has had a considerable presence, and some architects continue to create minimalist interior spaces which leave little place for anything beyond the built-in elements in their own designs. The late 1970s and rumbustious 1980s have, to some extent, been a replay of the 1870s and 1880s, with overseas firms such as David Hicks and Colefax and Fowler establishing outlets and with some of the world's major textile firms represented by local agents. Occasionally a client brought in a West Coast American interior designer or architect. The recession of the early 1990s demolished some interiors created by the latest wave of overachievers. Today most Australian decorators and interior designers do their bi-annual swing around the world, taking in the latest American, English and Continental developments, soaking up the international glossies and, with few exceptions, producing modest versions of whatever homogenized, globalized style is currently fashionable.

Since 1788 almost every important overseas style of interior decoration has appeared in Australia, yet none has developed significantly in local hands. Indeed, some appear to have mutated on the voyage out. There have been quirky and resourceful individuals at work, but few heroics or soaring visions in major houses, which by and large have been restricted to the eastern and southern fringes of the continent. Although too isolated ever to penetrate the meaning of new styles, Australia was never sufficiently insulated to develop distinctive interiors as America did. A small population precluded the development of industrial traditions or skills and creative tumult and a lack of real money put a certain standard of interior out of reach. The colonies were linked initially to Britain and by the time Australia's outlook broadened to take account of America, copying had become a national way of

life. The country has a high level of house ownership and a high ratio of rooms per person, and the average interior, even if undesigned, is extremely liveable. Yet at the highest level interiors have been and remain derivative – the creations of a “ship fed” people making tasty dishes from stale bread and largely unfussed by climate, landscape or commonsense. Money can still be spent with more satisfaction in London and New York than anywhere else in the world. An obsession with the rest of the world rather than a desire to discover what suits this corner of it has inhibited the growth of a national Australian style of interior decoration.

Authentic Decor

"Authentic Decor" is the label often used to describe a more accurate approach to the study and restoration of period interiors and designs. This trend began in the late 1960s when new methods of research, the development of more scientific conservation techniques and the introduction of higher professional standards within museums and heritage organizations began to transform the field of historic preservation. It continued in the 1970s and 1980s when earlier restorations in many public buildings and museums were re-evaluated and often redone. Within this context, Authentic Decor in its purist sense has been the province of scholars and dedicated preservationists. But it has also had an important impact upon the commercial sector and certain sections of public taste, influencing not only the general fashion for period styles but also an interest in more historically accurate features and designs. And as the craze for period living has grown, large numbers of architects, craftspersons, consultants, manufacturers and salvage dealers now specialize in authentic reproductions suitable for either the grand historic interior or the more modest period home.

Public interest in historic preservation was fueled by many factors. In Europe, the devastation of World War II encouraged and expanded government protection of surviving historic properties. Patriotism and nostalgia for the perceived comforts of the pre-industrial past, which inspired turn-of-the-century antiquarians, maintained their hold on the popular imagination. Rebellion against the austerity of the modernist canon and contemporary minimalism – not to mention the cheap sterility of many second-rate modern structures – also played a major role. In particular, renewed respect for Georgian and Victorian buildings encouraged interiors which expressed the original architecture, rather than anachronistic open rooms created by gutting walls and cutting new windows. Scholarly attention to vernacular buildings and the work of seminal modern architects like Frank Lloyd Wright and Walter Gropius extended the scope of this concern. Perhaps most importantly, rising housing costs in the suburbs made decayed older buildings appealing to buyers willing to expend a little sweat equity. These "urban pioneers" brought energy, spending money and a certain cachet to old neighborhoods, making them attractive to second and third waves of increasingly affluent buyers. The townhouse squatters of the 1960s cleared the way for the campy Victorian revival of the early 1970s; but as even middle-class Victorian buildings gained prestige they soon shed the aura of camp, and the pursuit of authentic decor absorbed a new class of homeowners who never could have afforded to live in country houses or castles, the traditional haunts of preservationists.

Of course, purists winced at the efforts of well-intentioned amateurs, the often theatrical use of period style by prominent decorators like Mario Buatta and Mark Hampton, and the ersatz "Country House look" of the 1980s. Identifying the "right" interior mouldings, wallpapers, paint colors and floor-coverings with X-rays and microscopic analysis sometimes

took on the character of a moral crusade, although in truth all restorations rely on the judicious use of an educated imagination. While entirely appropriate for historic sites and period rooms, this approach has proved too expensive, time-consuming and inflexible for most individuals. The formal furniture arrangements of the 18th century, for example, have little relevance to modern life. All but the most uncompromising owners have included modern appliances, heating and plumbing, even when well-disguised, and otherwise conscientious restorers are not always content to live in the darker, closer environments of the past. Many Victorian and Arts and Crafts homes restored in the 1970s and '80s, for example, while otherwise reverently researched and furnished, have been painted in pale hues more palatable to modern taste than their original murky tones. In contrast to the blithe remodelling projects of earlier decades, however, a sense of historical responsibility now impels many owners carefully to photograph, sample and measure original elements before any alterations are made.

In contrast to the enthusiastic support of architectural historians, many architects have expressed frustration with the rigidity of governmentally-imposed preservation guidelines, and architects and interior designers specializing in strictly authentic restorations remain relatively rare. Quite naturally, most are concerned first to create beautiful, liveable environments which please their clients, and to weigh authenticity against both the owners' needs and their own aesthetic interests. In general, designers working on older homes have preferred to reproduce the "feel" of the original design, preferably with some subtle, witty stamp of their own. By preservationist standards, most decorators' period interiors of the 1980s, while opulent and delightful, were also wildly overfurnished.

The preservation debate dates at least from 1789, when James Wyatt's over-zealous "restoration" of Salisbury Cathedral inspired a movement to preserve architectural monuments untouched; John Ruskin later became an influential proponent of this approach. Interiors were of less concern until the 1870s, when the Museum of Scandinavian Ethnography opened its first period rooms. These were of dubious accuracy, but their designers were probably the first to consult paintings and prints as sources for authentic interiors. The growing popularity of open-air and house museums and the burgeoning interest in antiques – especially in Britain and North America – encouraged the use of period styles, and by 1900 most books on interior design were essentially primers on historic furnishings. But early preservationists had little reliable information to guide their efforts, and their interiors were generally crammed with picturesque collections of antiques and reproduction furnishings arranged to suit contemporary taste. While a growing emphasis on scholarship, expressed in works like Henry Havard's *Dictionnaire de l'Ameublement* (1887–90), ensured that the details were often right, the effect remained essentially modern.

The wholesale purchase of period rooms – panelling, chimneypieces, mouldings, flooring and all – reached its apogee in the 1920s, by which time most major museums in Europe and America had installed at least a few. Opposition to this practice encouraged new guidelines for documenting and reconstructing interiors: the integrity of the original was to be preserved at all costs, and all new materials were to be clearly

identifiable to future researchers. Promoted by influential leaders like William Sumner Appleton of the Society for the Preservation of New England Antiquities, these principles have remained the basis for nearly all later restorations. During the 1930s, researchers' efforts to identify original materials and mine estate inventories and other period documents for details of interior decoration began to bear fruit: John Fowler's early work on English country houses managed by the National Trust, for example, relied on careful study of historic fabrics, color schemes and furnishing plans, and has greatly informed the independent work of his decorating firm, Colefax & Fowler. Meticulous, focused research and scientific analysis are now considered essential for all professional treatment of historic interiors, although the staff of many freshly restored historic houses have faced consternation from traditional supporters with an attachment to the "wrong" wallpapers and furnishings. In a few cases, the original restoration itself is worthy of preservation as a document of early 20th century ideas and taste. Restorers must also grapple with the representation of a room's use over time: in many cases heirlooms and outmoded forms should ideally be combined with new pieces, and in older buildings, deciding which period to recreate can present a real quandary.

The last ten to fifteen years have also seen an explosion of literature on the history of interiors and the decorative arts. Mario Praz's *Illustrated History of the Interior* (1964) was a pioneering study in this field and was one of the first books to use paintings as important sources in the documenting of period decorations and furnishings. Numerous other scholarly texts have followed, amongst the most influential of which have been the books published by the English historian Peter Thornton (*Seventeenth-Century Interior Decoration in England, France, and Holland*, 1978; *Authentic Decor*, 1984; and *The Italian Renaissance Interior*, 1991) which have emphasised not only period illustrations but also the role of estate inventories and literary sources in helping to develop a clearer understanding of the arrangement and use of historic rooms. More recently, these have been supplemented by sourcebooks and manuals published by American and British heritage organizations such as the Society for the Preservation of New England Antiquities, and the National Trust, which are aimed at both a professional audience and amateurs. A more general readership has also been served by a large number of colour magazines including *Antiques*, the *World of Interiors*, and *Period Interior Decoration*, which feature articles on period homes.

The growth in books and magazines has been paralleled by a huge increase in the availability of reproduction patterns, furnishings and architectural features. Up-market decorating firms such as Colefax & Fowler and Cowtan and Tout have been producing copies of historical wallpapers and textiles for many years, but it is only since the 1970s that the taste for

period styles has been reflected in the work of more commercial manufacturers. The British firm Laura Ashley led the way in the late 1960s with their small, sprigged and geometric fabrics based on early 19th century originals. Since then the market for period patterns has expanded enormously until virtually every new collection in the mid- and late 1980s included at least one historic design; even Habitat produced a range of Arts and Crafts textiles in 1992. In many cases these are not exact reproductions, and commercial patterns often involve alterations of scale and colour to suit contemporary tastes. But increasingly, with many of the more expensive products, authenticity has become an important means of ensuring sales.

Baldwin, Billy 1903–1983

American interior decorator

Back in the mid-1930s, the New York society decorator Ruby Ross Wood declared amusedly of her slight, dapper young assistant, “Billy is small, but his sting is deep”. The comment was directed justly at Billy Baldwin’s thorny personality, but at its heart lay an unspoken promise. By the end of the next decade, Baldwin was well on his way to earning the nickname of his mature years, “the dean of American decorating”. His hallmarks – strong silhouettes, tailored upholstery, printed cotton fabrics, fresh clear colors and whimsical *objets d’art* sternly organized – would define sophisticated taste in the United States in the 1960s.

Born at Roland Park, a prosperous suburb of Baltimore, Maryland, on 30 May 1903, William Willar Baldwin, Jr., was the eldest child and only son of W. W. Baldwin, an insurance broker, and his wife, Julia Bartlett, a foundry heiress. Destined for a comfortable if not luxurious life on the periphery of the horsey aristocracy of Baltimore, Baldwin dutifully went to Princeton University in 1922, only to leave two years later, under an academic cloud that he would later ascribe to a lack of interest in mathematics. Immediately he moved to New York City and worked, briefly and unhappily, as an insurance salesman, then, surprisingly, as a crime reporter at the *Baltimore Sun*.

Eventually, he ended up in the stockroom of the fashionable Baltimore decorators C.J. Benson and Company, where “the only thing I had to do was fold every single [fabric] sample and put it back on its rack after the client had taken it out and straighten the room every afternoon before I went home” (Baldwin, 1985). The color combinations into which he arranged those fabrics, however, impressed his employer, and after a few months’ apprenticeship working on the houses of the local gentry, Baldwin, then 25, was hired as a staff decorator.

Soon he caught the attention of Ruby Ross Wood (1880–1950), an avant-garde if today little-known Manhattan

decorator who ghost-wrote Elsie de Wolfe’s 1913 decorating manual *The House in Good Taste* and espoused bed-ticking upholstery, Moroccan rugs, white painted floors and varnished card lampshades in an era of hidebound traditionalism. “If we ever recover from this goddamned Depression, I really think I would like to have you work for me,” Wood reportedly said after seeing the colorful drawing room Baldwin decorated for a mutual friend: poison-green walls, yellow satin upholstered furniture, 18th century black-and-gold lacquer tables and Irish equestrian paintings with riders dressed in bright pink coats. Five years later, she did hire him, and excepting an assignment to the US Army Medical Corps during World War II, Baldwin remained in Wood’s employ until her death in 1950. That year, he formed Baldwin, Inc., which was in operation under a variety of names – Baldwin and Martin, and Baldwin, Martin and Smith – until his retirement in 1973.

Instead of the brown-wood English conservatism or neo-Versailles frivolity that dominated the monied domestic interiors of mid-20th century America, Baldwin popularized leanly furnished, vibrantly accented rooms whose subtle luxury and textural interest were achieved by treating common materials with uncommon care. These optimistic, seemingly carefree interiors were especially appealing to the leaders of post-war American society, whose lifestyles emphasized moral freedom, youthful sophistication and household efficiency. According to Mark Hampton, Baldwin espoused a “light, immaculate, rather new look” with a “sleek, well-organized appearance” and “sparkling clarity”, qualities that symbolized his belief in an independent American style.

“I am against the all-English house or the all-French house or the all-Spanish house”, said Baldwin, who was the most prominent member of his field successfully to challenge the prevailing Europhilia in favor of developing a native American style that filtered its myriad cultural references through the prism of fresh-scrubbed modernity. “We can recognize and give credit where credit is due to the debt of taste we owe to Europe, but we have taste, too – in fact, we’re a whole empire of taste. That is my flag and I love to wave it.” His aesthetic jingoism was codified in two insightful manuals-cum-memoirs, *Billy Baldwin Decorates* (1973) and *Billy Baldwin Remembers* (1974).

Among his many clients were Jacqueline Onassis, Pamela Harriman, Greta Garbo, Barbara Hutton, the playboy Whitney Warren, the philanthropists Rachel and Paul Mellon,

and the fashion mogul Hattie Carnegie. Much publicity was given to his interiors for two multi-house couples: Mary Wells Lawrence, an advertising agency founder, and her husband, Harding Lawrence, the president of Braniff Airlines (for whom Baldwin decorated four vast residences in as many years, in New York, Texas, Arizona, and France); and Kathryn Bache Miller, a banking heiress, and her husband, Gilbert Miller, a theatrical producer (for whom Baldwin decorated all or part of residences in England, Spain, and New York).

The most memorable project of Baldwin's many years as a decorator, however, was a small sitting room (c.1970), for Diana Vreeland, the flamboyant editor-in-chief of *Vogue* (US), and her husband, T. Reed Vreeland, a banker. Barely 15 feet square, the room was a cornice-to-baseboard panoply of vibrant scarlet-and-black flowered cotton chintz. The walls, furniture and curtains all were upholstered in the fabric, producing a lushly claustrophobic, vaguely alarming ambience that Mrs. Vreeland favorably compared to "a garden in hell".

Baldwin's innovation as a decorator was his development of elemental basics – some time-honoured, others his own designs – that could be used dependably in most situations, from tiny one-room flats to corporate offices to the houses of millionaires, and it seemed, with most any style of decoration, art or fabrics.

Less a strict formula than a Palladianesque philosophy of eternal harmony and comfort, these so-called "Baldwinisms" formed the core of many of his interiors. The major components were Louis XVI armchairs; deep, low, boxy sofas that recalled the streamlined creations of his idols Jean-Michel Frank and Syrie Maugham; handwoven fitted carpets with tiny geometric patterns (these greatly influenced the British decorator David Hicks); bulbous white plaster lamps à la Diego Giacometti; Chinese Coromandel screens, and Parson-style table, headboards and desks, made of wood tidily wrapped in clear-varnished rattan.

A particularly important piece of Baldwin furniture was the open bookcase that he designed in 1955 for the library of the songwriter Cole Porter. This was "one of the most famous rooms designed in America", according to the eminent architecture critic Brendan Gill, who greatly admired its walls, which were sheathed in tortoiseshell-finished leather. A towering skeleton of solid polished tubular brass set with ebony shelves, the bookcase was derived from a *Directoire* étagère that was purchased in the 1920s by Porter's wife, Linda. Like many of Baldwin's creations, it spawned a plethora of imitations.

In fabrics, Baldwin's preference was for bold colors, crisp motifs and relatively humble materials. "Cotton is my life", he told a reporter from *The New York Times* in 1965, at the height of his fame. So were linen and wool, which he deemed more suited to the pace of modern life than brocades and damasks.

The patterns of many of the fabrics that Baldwin designed were based on the works of 20th-century artists; all were manufactured by Woodson Wallpapers, an influential American fabric and wallcovering company owned by Woodson Taulbee, Baldwin's erstwhile companion. The leafy motif of a black-and-white printed cotton and matching wallpaper, for example, utilized a magnified detail from a pen-and-ink drawing by Henri Matisse that was owned by Baldwin. A

Matisse still life of lemons and red and purple anemones inspired another popular wallpaper. Yet another owed a debt to the swirling patterns of a painting by Gustav Klimt.

Deep glossy walls were Baldwin leitmotifs. From 1946 to 1951, an aggressively shiny green was the dominant color of Baldwin's apartment at Amster Yard, an influential complex of renovated tenement buildings at 213 East 49th Street in New York. In his memoirs, he wrote that the color, an homage to Elsie de Wolfe, was copied by the painter from a gardenia leaf that "I had licked to a glisten".

Throughout the 1960s and early 1970s, he was especially fond of a color he called "Coromandel black-brown", a dark chocolate-colored enamel painted with a high-gloss, lacquer-like sheen. This, he said, soothed the "beams and bumps" of modern apartment buildings. It was used most prominently in Baldwin's own much photographed one-room apartment on East 61st Street, New York. He lived here from 1963 until 1979, when he moved permanently to a two-room cottage on the Massachusetts island of Nantucket.

Baldwin cited several influences on his work: Ruby Ross Wood, the French decorator Madeleine Castaing, and Dr. Claribel Cone of Baltimore, a pioneering collector of Impressionist art. Another was the 1930s California decorator Frances (Adler) Elkins, whose innovative synthesis of French Modernism, North African textiles and rough country furniture was largely ignored by the anti-Semitic, pro-Manhattan decorating press in the US. But the profoundest influence on Baldwin's style was an American fashion designer Pauline Fairfax Potter (known from 1954 as Baroness Philippe de Rothschild).

A Paris-born aesthete who met Baldwin when she moved to Baltimore as a teenager in 1925, Potter was known for calculatedly simple gestures that combined sophisticated rusticity with a theatrical sense of the surreal. "Her great gift was the unconventional use of conventional things," Baldwin told the writer Cleveland Amory in *Vogue* (US). Among her stylish affectations were bare windows "curtained" with giant potted camellia trees; 18th-century French lacquer commodes topped with crudely woven straw baskets for storing loose papers or magazines; cast-bronze faucet handles in the shape of lemons; and dining tables set with clumps of wild reeds and moss instead of cultivated flowers.

According to the American choreographer John Butler, a friend of Baldwin and Potter, it was the Dietrichian proportions of Potter's lower limbs that inspired the decorator's famous *Slipper* chair (also known as the *Lawson Slipper* chair). A diminutive descendant of a chair that Baldwin had adapted in the 1930s from the popular *Lawson* sofa, his low-slung *Slipper* chair featured a broad square seat and gently angled back that "small women and football linebackers find ... equally comfortable", the decorator said.

Traditionally upholstered in woven Madagascar grass cloth and cushioned with white duck, the chair was a Billy Baldwin hallmark. It appeared throughout his career in a variety of fabrics: white-piped beige canvas (Ellena du Wolcott Blair, Palm Beach, Florida, 1936); white sailcloth stencilled with sulphur-yellow orchids (John King Reckford, Montego Bay, Jamaica, 1938); white cotton trimmed with cobalt-blue tapes (Mary Runnells, Hobe Sound, Florida, c.1959); black leather (S.I. Newhouse, Jr., New York, 1965); flowered scarlet chintz

(Diana and T. Reed Vreeland, New York, c.1970); pink-and-blue tattersall (Kathryn and Gilbert Miller, Mallorca, Spain, c.1967), and apricot cotton (Maité and Don Plácido Arango y Arias, Madrid, 1972). One of the chairs is in the permanent collection of the museum of the Maryland Historical Society at Baltimore.

Baldwin's commercial projects were as emblematic of brisk, bandbox-perfect American chic as his residential work. These included the Woodward Gallery of Sporting Art at the Baltimore Museum of Art (1956); the Round Hill Club, Greenwich, Connecticut (1959); a Brighton Palace Mod beauty salon for Kenneth Battelle, the New York society hairdresser (1963); and a renowned redecoration of Tiffany and Company, the jewellers, which Baldwin furnished with rattan-wrapped furniture, white linen fitted carpeting and white wallpaper printed with a lively, neo-Persian pattern of black flowers and vines (1963).

He also designed stage sets, notably a lilac-and-white Adam-style drawing room for Gilbert Miller's production of the American premiere of William Douglas-Home's *The Reluctant Debutante* (1956). A little-known and now lost Baldwin design was a wood stand, in the shape of a slender fluted Greek column, for the America's Cup sailing trophy (1952).

Baldwin died of pneumonia at Nantucket Cottage Hospital, on 25 November 1983, aged 80.

MITCHELL OWENS

Biography

William Willar Baldwin, Jr. Born in Roland Park, Baltimore, 30 May 1903. Attended Princeton University, New Jersey, 1922–24. Worked as a staff decorator for C.J. Benson and Company, Baltimore, c.1928. Employed as a decorator by Ruby Ross Wood (1880–1950), 1935–50. Served in the US Army Medical Corps, 1942–43. Established his own decorating business, Baldwin Inc., 1950; later in partnership as Baldwin and Martin, and Baldwin, Martin and Smith; retired, 1973. Also designed stage sets, mid-1950s. Died on Nantucket Island, Massachusetts, 25 November 1983.

Selected Works

Baldwin's professional papers have disappeared. His work can be studied only through photographs, rare surviving interiors and home furnishings designs. His tables and upholstered furniture for Luten Clary Stern (1975) are now produced by Ventry Limited, of Locust, New Jersey. His brass bookcase for Cole Porter (1955) continues to be made by its original manufacturer, P.E. Guerin Inc., of New York.

Interiors

- 1955 Apartment 33A Waldorf Towers, 100 East 50th Street, New York (interior decoration and some furniture): Cole Porter
- 1959 Round Hill Club, Greenwich, Connecticut (interior decoration and some furniture)
- 1963 St. Regis Hotel, 2 East 55th Street, New York (interior decoration and some furniture): Barbara and William S. Paley
- 1963 Apartment., East 61st Street, New York (interior decoration): Billy Baldwin
- 1963 Kenneth Salon, 19 East 54 Street, New York (interior decoration and some furniture): Kenneth Batelle
- c.1967 Miller Residence, Mallorca, Spain (interior decoration): Kathryn and Gilbert Miller
- 1968 Onassis Villa, Skorpis, Greece (interior decoration): Jacqueline and Aristole Onassis

- c.1970 550 Park Avenue, New York City (interior decoration and some furniture): Diana and T. Reed Vreeland
- 1971 La Fiorentina, St.-Jean Cap Ferrat, France (interior decoration and some furniture): Mary Wells and Harding Lawrence
- 1972 2510 Foxhall Road, Washington, DC (interior decoration): Deeda and William McCormick Blair, Jr.
- 1979 22 Hussey Lane, Nantucket Island, Massachusetts (interior decoration and some furniture): Billy Baldwin

Baldwin designed the America's Cup trophy in 1952. He also designed a range of tables and upholstered furniture for Luten Clary Stern in 1975 and a range of wallcoverings and fabrics for Woodson Wallpapers, New York in 1976.

Publications

There is no critical monograph on Baldwin; most informative sources relating to his life and career are his own writings, particularly *Billy Baldwin Decorates* and *Billy Baldwin Remembers*.

Bamboo Furniture

In the Far East, the indigenous bamboo (*bambusa arudinacea*) has been an important material in house building, roofing, and in the making of simple furniture for many centuries. Its use in furniture-making can be traced to India in the 2nd century AD, although it is more commonly recognised as a product of China or Japan.

In the West there has been a fascination with the Orient for at least four centuries and this has been manifest in a number of ways. The particular taste for bamboo furniture started in 1757, when Sir William Chambers first published designs of it. Chambers's connection with Sweden is demonstrated by the existence of authentic Chinese bamboo furniture in some of the royal residences there.

Chairs were the main items to be given the bamboo treatment, although in many cases the bamboo furniture of the period was an imitation effect. Famous examples included bedroom chairs for David Garrick carved to imitate bamboo and painted a creamy white with the “knots” in green, while the Royal household at St. James’s was supplied with “Bamboo elbow chairs ... very neatly japanned yellow ground and spotted rings”.

The imitative process was popular into the early 19th century. Sheraton describes how beech was turned into chair parts which were then painted and flecked to imitate bamboo, while turned legs, fashioned to imitate bamboo, were used in a wide variety of furniture types. The exotic tastes of the Prince Regent gave a spur to the introduction of bamboo into the “Chinese” furnishings of the Royal Pavilion at Brighton, with many of the projects being produced in imitation of real bamboo. Some furniture examples supplied by Edward, Marsh and Tatham were made from a mix of real and imitation bamboo, combined with authentic lacquered panels.

The taste continued into the 19th century and was especially employed in making bedroom or fancy chairs. This furniture could well have been put into rooms which were decorated with wallpapers imitating bamboo and basket work. The example of the bamboo furniture supplied to the Chinese room at Claydon House c.1800 demonstrates this taste.

Although it gradually went out of high fashion during the first half of the century, by the mid-19th century bamboo was being imitated in materials other than wood. Cast-iron chairs painted to imitate bamboo caused particular consternation to the *Journal of Design*: “We really had imagined that society was getting tired of the conventional upholsterer’s bamboo with its three black strokes and splashes to indicate foliations: but here it is breaking out in the most inveterate form, upon a material least of all calculated to support the attack”.

It was the West’s attraction to things Japanese following the opening up of the country from 1854 that eventually spawned a fresh demand for bamboo among other Oriental-style artifacts.

During the 18th century bamboo had been imported into America, and some manufacturers soon introduced imitation bamboo into their ranges. Samuel Gragg advertised bamboo fancy chairs in 1809, for example. Later in the 19th century firms such as the Vantine Emporium in New York were importing ready-made furniture from the East. On the other hand much allegedly oriental furniture, produced by businesses in several cities, was made from imported raw materials. These makers produced ranges of occasional furniture such as side tables, what-nots, flower stands, and the like. The Boston firm of James E. Wall seems to have specialised as a bamboo furniture-maker between 1881 and c.1895.

France also developed a business in bamboo furniture. In 1859 Joseph Cavoret applied for patents to protect his particular methods of imitating bamboo, while the business of Perret & Fils & Vibert made a speciality of bamboo furniture for export. They were particularly associated with a range of bamboo produced in three different colours – red, white, and black – which appears to have been successfully sold in America.

Imports of bamboo materials were soon made in England, and the first bamboo furniture-makers, Hubert Bill, seem to

have been in business from 1869. By 1910 there were over 130 manufacturers working in the business of bamboo furniture. The bulk of the trade was situated in the East End of London, but the biggest establishment was founded in Birmingham. This city became a centre for the trade and large quantities of the fashionable products were made by the firm of W.F. Needham.

Needham’s business started in 1886 and used his patent process to make a range called Ferrum Jungo. This method used a system of metal sockets and shoes which avoided the problems of splintering ends of poles and of the usual nailed joints coming loose. The business was so successful that by the mid-1890s Needham employed over 300 workers who produced over 4000 pieces of furniture per week.

In the last quarter of the 19th century there was a vogue for bamboo furniture based on the Japonisme style. Used in conjunction with lacquer panels and woven grass matting, it ideally reflected the Aesthetic tastes of the period. It was not only the fashion that made it popular however. Bamboo was lightweight, relatively inexpensive and decorative in its own right, while the tubular reed made it particularly appropriate for designers who were already attracted to using materials to produce vertical and horizontal forms.

Despite, or perhaps because of the considerable success of real bamboo furniture, it was still found that some manufacturers of more conventional furniture would use the imagery of bamboo in their products. George Hunzinger in New York produced chairs with turned legs in imitation of bamboo, and the European business of Thonet included bamboo styles in their range of bentwood furniture.

Throughout the 20th century, bamboo has continued to play a minor part in the repertoire of furnishings. Being lightweight and flexible, it was well-suited to the Contemporary furnishing style of the 1950s. In the 1980s it was seen as ideal for the conservatory-living style.

Bamboo has also had other roles to play in furnishings, since it was also suitable for interior decoration as well as for furniture. Split and varnished sections could be used for beading around panels, ceiling decoration, dados, cornices, and mantles, and even stair rods. It has been pressed into service for cornice poles, fire-screens, and shelving, as well as for the more common jardinières, chairs, and chair companions. The use of bamboo in cane-edge upholstery and bedding is also worthy of mention. It was used to provide a flexible but shape-retaining front or side edge to divans and sets of upholstered chairs prior to the ready-made spring unit which was complete with flexible metal edge built in.

Barbet, Jean 1591–c.1654

French designer and architect

Jean Barbet was a French architect attached to royal circles who is best known for his book, *Livre d'Architecture d'Autels et de Cheminées* (1632), which was widely used as a source-book for fireplace designs both in his own country and in England and Sweden.

Little information relating to Barbet's life survives, but he is recorded as being in Rouen in 1616. From thence he travelled to Paris to work as an architect for Cardinal de Richelieu to whom he dedicated his *Livre*. The book contains twenty engraved designs depicting altars, fireplaces, mirrors and picture frames. The first edition was published in 1632 and met with such success that a second edition was issued in Paris and Amsterdam in 1641. The plates were engraved by Abraham Bosse who also worked as a painter and produced

many charming views of fashionable Parisian interiors. The book's aim, stated in its foreword, was to show "ce qu'il y a de beau dans Paris" (that which is handsome in Paris). Although it included designs for other features, it became famed for its designs for chimneypieces in particular. Another edition containing simplified versions of Barbet's engravings also appeared in Amsterdam at about the same time, and his work was in part reproduced in Robert Pricke's *The Architect's Store House* (London, 1674).

Throughout the 16th century the chimneypiece was widely regarded as the most important feature of the room as it was locus of both warmth and light. Not surprisingly, therefore, it was the feature on which contemporary architects lavished most care and attention and it was the first part of the interior to warrant the production of ornamental pattern books devoted specifically to its design. The sheer size and style of fireplaces during this period, which typically had bold projecting surrounds that dominated the wall, also encouraged a demand for fresh ideas on how to incorporate them into interior schemes. The architect Philibert de l'Orme included some drawings of chimneypieces in his treatise of 1567 and other French designers such as Pierre Collot and Jean Le Pautre, and subsequently Jean I Berain and Jean Marot also published engravings of this kind. But to a large extent Barbet can be

Barbet: two designs for chimneypieces from *Livre d'Architecture*, 1641

viewed as a pioneer in this field and his *Livre* was the most celebrated sourcebook for much of the 17th century.

During the early 17th century, fireplaces were beginning to shed the massive and functional appearance that characterised earlier forms, but it is still possible to discern a certain lack of cohesion in Barbet's designs based as they were on existing Parisian forms. By the 1660s (after Barbet's death), French chimneypieces had evolved into a more refined, elegant structure with a lower, smaller opening and more simplified decor. This development can be seen in the designs of Jean Le Pautre, whose work was described as *à la Moderne*, and such fireplaces are distinct from Italian or Roman examples where the composition is more architectural and where the central frame is flanked by figures.

Barbet's designs were in the main executed in the bold Mannerist style associated with the School of Fontainebleau and often included strongly protruding figures, heavy garlands, sculptural putti and swelling volutes. He also, however, produced designs in a more sober style where the only embellishment was the architectural features. But it was his chimneypieces that extended from the floor to the ceiling – described as *à la Française* – where he combined the arts of painting, sculpture and architecture, that were most frequently imitated.

Barbet's work exercised a strong influence on the English architect Inigo Jones. By training and by inclination Jones was primarily drawn to Italian Renaissance architecture and he made several extended study trips to Italy to augment his knowledge of the Classical idiom. But he also sought inspiration from French sources for the interiors of his Palladian-style buildings. The eclectic nature of this approach arose partly from his recognition that Paris was then at the forefront of fashionable design but also from necessity. While the Italian treatises of Scamozzi and Palladio provided some information about mural decoration and the structure of ceilings, other elements of the interior were not discussed and for details such as ornament and architectural fittings Jones was forced to look to Northern European engravings. Much of Jones's work for the British court also coincided with the arrival in England of the French queen, Henrietta Maria, who brought with her a taste for French styles and French sources which were particularly important in his designs for the Queen's House, Greenwich, which was built in the 1630s. Some of the chimneypieces in the Queen's House represent exact borrowings from Barbet. Others illustrate how Jones rationalised Barbet's designs by modifying the use of the decorative elements. Where Barbet creates a heavy, somewhat cluttered-looking form by placing all the elements one on top of the other, Jones separates out the different sections of the fireplace to produce an altogether more classical design. The painting above the fireplace opening thus gains in importance and becomes an imposingly framed yet integrated part of the whole chimney surround.

The Double Cube room at Wilton House, designed by Jones and his pupil John Webb, also boasts a chimneypiece composed from different plates in Barbet's book, with the details combined in such a way as to make the borrowings less obvious. The fireplace includes heavy volutes and garlands in the lower section, while the square painting above is flanked by standing figures with Corinthian capitals and putti resting on a broken entablature. An even more remote example of Barbet's influence can be seen in the interiors of Skokloster,

north of Stockholm, the castle built by Count Wrangel following his victories in the Thirty Years' War. Several of the chimneypieces are modelled on the plates in Barbet's book while certain of the ceilings are clearly indebted to the work of Jean Le Pautre. Moreover, Barbet's influence did not entirely fade away with the passing of the 17th century. His designs indirectly affected the drawings made by Lord Burlington in the late 1720s whose designs for fireplaces for the West Closet at Chiswick House were based on those used by Inigo Jones at Greenwich.

Baroque

The Baroque style developed first in painting, before spreading to other media, at the end of the 16th century. Initially a style centred in Rome, the Baroque featured contrasts of dark and light and rich effects of colour and texture. A dramatic, theatrical style of art, the Baroque was often highly classical in iconography and subject matter, reaching its climax in the Apollo imagery adopted by Louis XIV of France. However, as the style spread northwards during the 17th century, it became more naturalistic in emphasis, culminating in the realism and

Baroque: gallery, Palazzo Colonna, Rome, 1572

floral decorative vocabulary of Baroque art in the Protestant Netherlands and in England. Baroque architecture, too, displayed this sense of drama with its boldly massed classical forms and powerful silhouettes. Interiors were dominated by a carefully planned sequence of rooms, each with a particular significance. Controlled contrasts of size, shape, colour and texture were at the heart of the effect of the formal Baroque state chamber.

The rapid development of trade with non-western cultures during the 17th century resulted in a flood of new and exotic materials to European cities which were quickly adopted by craftsmen to achieve the effects of novelty and surprise that were much prized during this period. For example, the English writer Aphra Behn, who possibly travelled to the Dutch Pacific colony of Surinam in the 1660s, described in her best-known work, *Oroonoko* (1688), the wonder felt by Europeans at their discovery of the richly coloured woods of the tropics: "The very wood of all these trees have an intrinsic value above common timber; for they are, when cut, of different colours, glorious to behold, and bear a price considerable to inlay withal."

The undoubted centre of the Baroque was Rome, where the Catholic Church used this powerful new style as a means of reasserting its authority in the wake of the challenge of the Protestant Reformation. However, while the emergence of a Baroque style in painting began in Italy late in the 16th century, the development of Baroque interiors can be traced to Rome during the 1620s, a decade that also saw the beginnings of the Baroque interior in France and the Netherlands. Therefore, although the influence of the Roman Baroque remained strong throughout the 17th century, even in the Protestant countries, each region developed its own version of the style. Indeed, in most cases Roman Baroque forms were used for their classical references, Rome having long been the centre of the antique world, rather than for their Catholic associations.

Among the early promoters of the Baroque in Rome were the Barberini family, whose most prominent member was Urban VIII, elected Pope in 1623. He was the principal patron of the sculptor Gianlorenzo Bernini, whose genius for creating dramatic architectural spaces and whose powerful modelling of the human form were to influence designers all over Europe.

Baroque: cabinet made for Madame de Maintenon, with *pietre dure* inlay, 17th century (Musées de la Ville de Strasbourg)

This influence was particularly strong in France, where the Barberini visited on several occasions, including a period of exile of family members in Paris from 1645 to 1653 when feeling ran strongly against them in Rome. Bernini visited France and supplied designs for the Louvre in the 1660s which profoundly influenced French Baroque architects. Baroque interior design responded to Bernini's famous baldacchino, or canopy, of St. Peter's in Rome, commissioned by Urban VIII in 1624. Its highly plastic, spirally turned columns revived from the late antique period were to be frequently used on cabinet furniture.

Bernini knew that Raphael had used the spiral column, signifying the architecture of the Biblical Temple of Solomon, on one of his cartoons for the *Acts of the Apostles* of 1514, which were designs for tapestries for the Sistine Chapel. These cartoons went first to Brussels for weaving into tapestries and then passed into the collection of Charles I of England early in the 17th century, ensuring their influence in northern Europe. This influence can be seen in the spiral columns of the marble chimneypiece for the Great Dining Room of Ham House, Surrey, executed in the 1630s by an English craftsman under the supervision of the Director of the Mortlake Tapestry works, Franz Cleyn, who had direct access to the Raphael cartoons.

The Baroque style represents a continuation of the classical

tradition re-established in Western art during the Renaissance, and Italian Renaissance ideas of bringing order and regularity into architecture and interiors were developed much further during the Baroque period. The central unit of organization of living quarters was the apartment, the most important of which was the state apartment, a lavishly decorated suite of rooms prepared principally for show, for ceremonial functions, and for the reception of a monarch or guest of elevated rank. Thus Baroque apartments for private living were developed as separate entities from public apartments, a distinction that was unknown in the Renaissance.

Central to the Baroque apartment, whether private or state, was the placement of an impressive bed with expensive draperies, a representation of the wealth of the owner. In 1617 Lady Anne Clifford, Countess of Dorset and resident at Knole House, Kent, wrote in her diary of her "Green Cloth of Gold Bed" in the Great Chamber, which was used only for important family occasions such as the birth of a child or serious illness. Knole has several splendid state beds from the Baroque period, including a bed probably made for the marriage of the future James II in the 1670s by Louis XIV's upholsterer. The bed is hung with rich textiles made of gold and silver thread, with elaborately carved, upholstered stools en suite.

The arrangement of a bedchamber preceded by an antechamber (or "Drawing" chamber) and followed by a small closet (or private room) was in place by the early 17th century. This arrangement was first developed into a formalized plan in Rome, where a strict etiquette for the receiving and paying of visits according to the relative status of the host and the visitor was observed during the 1620s and 1630s. This etiquette governed social behaviour, which was dominated by the Church and the requirements of diplomacy. From Rome, this etiquette spread to the French court during the first half of the 17th century under Louis XIII, his formidable wife Anne of Austria, and their powerful Italian-born minister Cardinal Mazarin (born Mazarini). For example, when Cardinal Francesco Barberini visited Louis XIII in the Louvre, he was received by him in a state bed richly hung with red damask and marked off from the rest of the room by a balustrade.

Such a ceremonial use of the state bedchamber was to reach its apogee during the court rituals of Louis XIV, where the *levée* and the *couchée* of the king – that is, his ceremonial getting up and going to bed – were likened to the rising and setting of the sun. It was important that, when at court, aristocrats and ambitious courtiers attended such rituals, where behaviour was strictly regulated. In Molière's play *The Misanthrope* of 1666, one of his characters remarked: "I have come straight from the Louvre. Cléonte has been making a perfect fool of himself there at the *levée*. Has he no friends who could in charity enlighten him as to how to behave?"

Therefore Baroque interiors were used as the settings for the rituals of formal etiquette, and even relatively modest apartments aped the arrangements at court. Living apartments assumed the form of a sequence of about five rooms, the grandest being on the *piano nobile*, or first floor, of a residence off a principal staircase. The first room was usually the largest in the apartment, a formal reception room (known as a *sala* in Italian, becoming the French *salle*) which could be used for formal dining. Often these rooms were furnished with a sideboard bearing an elaborate arrangement of plate and vessels.

Entertainments and dances could be held in this room when the tables and chairs for dining were cleared away. In Daniel Defoe's novel *Roxana* (1724), which was set in the time of Charles II, the lady Roxana explained how she rearranged her apartment for a grand party: "I had a large Dining-Room in my Apartments, with five other Rooms on the same Floor, all which I made Drawing-Rooms for the Occasion, having all the Beds taken down for the Day; in three of these I had Tables plac'd, cover'd with wine and Sweet-Meats; the fourth had a green Table for Play, and the fifth was my own Room, where I sat."

In a state apartment, the room beyond this first reception room was an audience chamber, furnished with a throne-like chair under a canopy, where formal visits took place. Seat furniture was arranged according to the status of the visitors, only the grandest of whom would be seated. This room assumed the function of the drawing room in a private apartment. Defoe's heroine Roxana described the essential furnishings of the smart middle-class drawing room as, "Pictures and Ornaments, Cabinets, and Peir-Glasses". Pier glasses were mirrors hung on the piers of masonry between the windows of the room, often above a side table, flanked by a pair of torchères, or candlestands, whose light was reflected in the mirror.

The Marquise de Rambouillet, the daughter of the French ambassador to Rome, became famous for the innovative decoration of her Paris town house during the 1620s. She introduced the practice of furnishing rooms with a unified suite of textiles, all of one predominant colour, and her apartment was arranged *en enfildade* – that is, all the doorcases of the various rooms were in alignment along the window wall of the apartment, creating an impressive vista. This arrangement, which became almost universally adopted in the Baroque apartment, threw into prominent view the furniture used against the pier. Therefore, as mirrors were luxury items in the 16th century, the pier glass with its accompanying suite of a table and two stands, often in sumptuous marquetry or japanned in imitation of Japanese lacquer, became important furnishings for the Baroque drawing room. The design of such furniture was developed in France, and richly sculptural designs for suites were published in the 1660s by the court designer Jean Le Pautre.

The third room in the Baroque sequence was normally a bedchamber. In state apartments the bed was a lavish and expensive creation of the upholsterer's art made primarily for show, whereas private apartments had beds which were actually slept in, often copying the grand design and draperies of state beds in less sumptuous materials. In some cases, such as the King's Apartments at Hampton Court, a state and private bedchamber were placed next door to one another. This practice was also used in Roman apartments in the 17th century. While the state bedchamber was the setting for ceremonial occasions, the private bedchamber was off-limits to all except close friends, family and servants, as was the closet (in French, *cabinet*), the small private sitting room beyond the bedchamber.

Because of its small size, being the smallest room of the Baroque apartment, the closet could be well heated in cold weather, unlike the larger rooms of the apartment, and richly decorated. The closet seems to have derived from the Italian

Renaissance *studiolo* and was decorated to reflect the personal taste of the occupier, often containing favourite paintings and works of art. The English architect Christopher Wren visited the apartments of Anne of Austria in the Louvre in 1665, and he reported that her closet was richly hung with small landscape paintings. The Duchess of Orléans, the daughter of Charles I of England, had a white closet in the 1660s furnished with a marquetry cabinet veneered in ivory by the Dutch-born *ébéniste* Pierre Gole, the favourite cabinet-maker of Louis XIV. This example may have inspired the white closet of Ham House for the Duchess of Lauderdale, one of the two closets in her apartment. Next to the white closet was a second one arranged as a small private study where she wrote letters and drank tea with friends. Ham is remarkable for having four closets surviving from the 1670s with ceilings painted by Antonio Verrio, and one from the 1630s with a ceiling painted by Franz Cleyn. A fifth closet from the 1670s was situated off the library and functioned as a "study".

One principal function of the Baroque closet was to provide a private room for writing, whether it be diaries, love letters or diplomatic correspondence. Such activities required quiet surroundings and appropriate furniture to take place, and writing furniture became a new and fashionable form of furniture for the Baroque closet. Surviving records tell us that beautifully made bureaux and cabinets in marquetry of sumptuous woods or materials such as metal and tortoiseshell were also shown off in the drawing room (or audience chamber) of the Baroque apartment, along with rare and exotic objects of lacquer and porcelain. The most highly prized bureaux and cabinets were made in Paris and the Netherlands (Antwerp and Amsterdam), with craftsmen in other European cities following the models set by these leading centres.

One very important interior outside of the Baroque apartment itself was the gallery, a long, formal room that was usually the largest in a residence and used to display the art collection of the owner. Such galleries could be visited by members of the public without disturbing the household, as they were physically distinct from, although often adjacent to, the living apartments. In the Roman Palazzo Borghese, a sculpture gallery was in place by 1610 on the ground floor of the house. Shortly afterwards, and inspired by Italian example, Lord Arundel created a sculpture gallery on the ground floor of his London town house that was considered the finest in northern Europe by visitors such as the Flemish painter Peter Paul Rubens.

Increasingly during the 17th century, paintings became the focus of galleries. This was especially true of central Europe, where Italian and Northern works were hung from the ceiling to the floor, as illustrated in David Tenier's painting of Archduke Leopold of Austria's Gallery of 1651, now at Petworth House in Sussex. Prague Castle had a similar gallery recorded in a painting of 1702 by Johann Bretschneider (now in Nuremberg) showing the paintings framed in ebony, with a suite of seat furniture upholstered in blue around the walls of the room. In some Baroque galleries, especially in smaller houses where the collecting of great works of art was beyond the reach of the owner, portraits of ancestors were displayed on the walls.

In an extraordinary development of this theme, Cardinal Girolamo Colonna constructed a gallery in his Roman palazzo

Baroque: state bedroom, Chatsworth House, Derbyshire, 1690s

to glorify the exploits of a famous ancestor who had fought against the Turks in the Battle of Lepanto at the end of the 16th century. Begun in 1654, the gallery was not completed until 1702 and was designed in the manner of an ancient Roman triumph. A triumphal column (also a play on the family's name) raised on a dais at the far end of the gallery formed a focal point for the decoration, with ceiling paintings glorifying Marcantonio Colonna above a classically inspired interior with enormous gilt console tables with large carved figures of conquered Turks by Filippo Passarini, made in the 1690s. The highly theatrical quality of the Palazzo Colonna gallery marks the apogee of the Roman Baroque interior.

Displaying a shift of function is the Grand Galerie of Versailles, now known as the Hall of Mirrors because of its wall decoration in mirrored glass, which was relatively rare and very expensive in the 17th century. The gallery at Versailles was large enough to contain the assembled court for ceremonies and entertainments, and the reflection of chandeliers in the myriad glass panes made it particularly dazzling at night. Light was further reflected by the famous silver furniture in the gallery, consisting of pier suites as well as planters for the numerous orange trees and perfumers which kept the air sweet. The artist Charles Le Brun, who was head of the Gobelins manufactory set up in the 1660s to supply furnishings for the royal palaces, masterminded the Baroque interiors at Versailles for Louis XIV until his death in 1690.

In 1685 Louis had revoked state protection for Protestants, many of whom were well-to-do craftsmen and merchants, and in 1689 he had been forced to melt down the silver furniture of Versailles to pay for a disastrous series of military campaigns. These two events marked the beginning of a steady decline in the fortunes of France, which was gradually overtaken in wealth and prosperity by England and Holland by the end of the century. The period of 1660 to 1720 saw many country houses built and furnished in these two northern Protestant nations, which shared a common ruler in Prince William of Orange and which benefited from the exodus of Protestant craftsmen from France. In addition, both nations were becoming wealthy from colonial and Far Eastern trade, resulting in a flood of exotic materials into Dutch and English Baroque interiors. In an account of the city of Amsterdam, written in 1662, Melchior Fokken remarked upon the shop of Dirk Rijswijk, where one could purchase tables and cabinets made with exotic inlays of mother-of-pearl.

The most popular of these exotic materials, however, were lacquer and porcelain, and the leading collector of the day was Queen Mary, the English wife of William III. Daniel Defoe, who acted as a spy for William in the 1690s, wrote of Mary's collecting in *A Tour through the Whole Island of Great Britain* (1724–26): "The queen brought in the custom or humour, as I may call it, of furnishing houses with china-ware, which increased to a strange degree afterwards, piling their china upon the tops of cabinets, scrutores [writing cabinets], and every chimney-piece, to the tops of the ceilings, and even setting up shelves for their china-ware ..."

Queen Mary also collected objects of oriental lacquer, whereas William was a gardening enthusiast and a collector of Italian and northern paintings. Their apartments at Hampton Court and Kensington Palace were dominated by large galleries in which they displayed their collections.

In addition to their taste for collecting, William and Mary influenced northern Baroque interiors through their choice of court designer. This was Daniel Marot, the son of a French court architect and nephew of the leading *ébéniste* Pierre Gole, who was foremost among the Huguenot artists and craftsmen leaving France in 1685. Marot worked principally in the Netherlands for the rest of his long life, but he spent several years in England in the service of William III during the 1690s. Marot's Baroque style was disseminated in designs he began to publish in 1698 and featured highly elongated proportions of furnishings, most notably elaborate state beds, and the lavish use of textiles. Some of the motifs he used, as in the espagnolette mask, can be traced back to French court designers such as Jean Berain, but the distinctive tall, narrow proportions of his forms, surmounted by an arched, double-scrolled top, which appeared on everything from wall panelling to chair backs, attest to the widespread use of his designs in northern Europe.

As Marot's influence was felt most strongly in England and the Netherlands, it is sometimes difficult to distinguish between Dutch and English designs of this period. Marot's influence can also be seen in interiors from Sweden, northern Germany, Ireland, and even in Dutch and English colonies in the Americas and Asia, well into the 18th century. In most European countries, the powerful tradition of Baroque design extended into the first half of the 18th century, but a new, lighter style of interior design was already being formulated in France. In 1713, the year before the death of the old and ailing Sun King, Mme. de Maintenon, his second wife, remarked, "We have no more Court here ... other members of the royal family are never at Versailles." Indeed, the younger members of the court had removed themselves to Paris, where the building of private town houses with comfortable and luxurious apartments for the reception of friends became an aristocratic pursuit.

J.-F. Blondel's important guide to house-building, *De la Distribution des Maisons Plaisance* (1737–38) consolidated this already-established shift towards private living apartments in the 18th century, with a new style, the Rococo, rising to ascendancy. By the 1740s the new style of France had largely superseded the Baroque in every fashionable centre in Europe, whereas in provincial areas or colonial outposts, the Baroque lasted a little longer. The development of private living areas, of interiors created to express individual taste, and of rooms differentiated by function are all key aspects of the development of European interiors that owe their origins to Baroque designers.

Basile, Ernesto 1857–1932

Italian architect and designer

Ernesto Basile is widely regarded as the most influential exponent of Italian Art Nouveau, known as *Stile Liberty*. Son of a distinguished architect, he was assistant professor of architecture in Palermo from 1877, and in 1888–90 taught architecture in Rome. He was the leading figure of Sicilian architecture and design at the end of the 19th century and was successful in several national competitions, designing many buildings in Sicily and Rome, including those for the Palermo exhibition of 1891–92; he also designed furniture. His modern style was developed after turning from sophisticated classical eclecticism to a personalised hedonistic Liberty style in the mid-1890s. He was aiming towards a renewal of architecture and to free it from the "vulgarity of the imitation of the past", though he

paid particular attention to 12th-century Sicilian art and architecture, and to Viollet-le-Duc and William Morris's experiments in medieval revival. His Ribaudo's kiosk (1894) represents the beginning of this creative trend and was the first example of Art Nouveau architecture in Italy.

Basile's Modernist approach was to highlight the importance of the relationship between exterior architecture and interiors. He attempted to create a mutual dialogue between each detail of his projects: from the window-frames to the doors, from the metalwork to the murals, and from the ceiling to the carpets, as well as in the furniture. He also returned to the use of neglected craft traditions, such as wrought-iron work and stone carving.

The Sicilian Florio family had one of the largest fortunes in Europe and in their search for a cultivated identity they provided Basile with much patronage. He designed the Villino Florio (1899) in the Olivuzza park in Palermo for them; unfortunately most of the villa was destroyed by fire in 1962. Another commission was for the Villa Igia (1899–1900), whose dining-room still survives, and illustrates Basile's understanding and use of modern elements. Here structure and ornament are successfully combined with a striking use of space and colour. The space is divided by a colonnade, and between the bow window and the main area of the room is a loggia overlooking Monte Pellegrino. Basile's attention to the harmonious combination of structural and ornamental elements is well illustrated here, as well as in the details such as the complicated light fittings, and in the design of single mirrors and doors whose decorative elements are repeated on the walls and the frieze supporting the ribs of the coved wooden ceiling. Other works in this style include the Utveggio House (1901) in Palermo. Among Basile's finest modern works are the Villino Fassini (1903), the Villino Basile (1903), the Municipal Palace of Liceta (1904), and Belmonte Palace (1906), and a vast number of interior designs which established his reputation internationally.

Basile is the only *Stile Liberty* architect to have had a long collaboration with a furniture firm. He worked with the Ducrot Company from 1899 to 1909. This firm was well established in the furnishing and cabinet-making fields, and its popular products were sold all over Italy. Although the firm continued to produce reproductions, Basile became artistic director of its modern work. This was important for Italian industrial design for it showed a new approach based on a recognition of the beneficial effect of the relationship between art and industry. Basile was in charge of two different kinds of furniture. The first consisted of richly carved and decorated unique pieces, designed for specific commissions and for exclusive interiors. The second kind was made up of cheaper furniture designed along geometric and functional lines. These pieces often formed part of a complete interior scheme, one of the most important of which was the oak workroom, shown at the Turin International Exhibition in 1902 under the joint name of Basile-Ducrot. In this scheme Basile combined oak and leather in an open structure characterized by a linear, modern design. The work was awarded a prize and was reproduced by Ducrot, with only minor changes, in hundreds of versions under the name of *tipo Torin'*.

At the Venice International Exhibition of 1903 Basile was in charge of the Naples and Sicily pavilion, where he demon-

strated a familiarity with the work of Charles Rennie Mackintosh, especially in a mahogany armchair, decorated with gilded and impressed leather. This formed part of the same suite of furniture as the maple display-cabinet in which Basile stressed verticality, and eschewed all intrusive decoration, leaving only the top part of the structure as ornament.

The Milan Exhibition of 1906 was a milestone in the Basile-Ducrot collaboration. They exhibited a series of garden furniture called the *del carretto sicilian*' (after the Sicilian cart) which was inspired by Sicilian folklore and which recalls the colour and shape of this typically Sicilian vehicle. In his use of colour contrasts and carvings Basile is closely linked to a widespread European movement which looked back to earlier traditions. But, concurrently, Basile was also searching for a new more geometric and abstract language. This search culminated in his work in the dining room of the Villa Delielia, where surfaces and space are defined and articulated by line alone in a manner that echoes the style of Austrian designers like Josef Hoffmann.

As a designer in the *stile floreale*' (florid style), Basile's use of naturalistic imagery was controlled and selective and involved only the occasional use of stylized flowers and husks. His most original design in this style was a curious sideboard, exhibited at Milan in 1906, whose simple, square structure is animated by crabs and an octopus.

At the end of his career Basile returned to the eclecticism which he had previously depised. This move was mainly an attempt to satisfy the demands of patrons whose tastes ran more to revivalist than to modern designs. Nevertheless, his work retained the drama and individuality characteristic of his earlier years, and today he is justifiably remembered as one of the most innovative Italian designers of the early 20th century.

MARIELLA PALAZZOLO

Biography

Born in Palermo, 31 January 1857, the son of the architect Giovanni Battista Filippo Basile (1825–91). Studied at the University of Palermo, graduated 1878. Apprenticed to his father. Settled in Rome, 1881; assisted his father on various architectural projects; independent practice from c.1899. Assistant instructor in architecture, Scuola di Applicazione, Rome; director, then professor of architecture, Istituto Royale di Belle Arti, 1893; professor of architecture, University of Palermo, 1892. Designed furniture from c.1898. Exhibited at several national and international exhibitions including Turin, 1902, and Venice Biennale, 1903. Died in Palermo in 1932.

Selected Works

Interiors

- 1894 Ribaud's Kiosk, Piazza Teatro Massimo, Palermo (building and interiors)
- 1899 Villino Florio all'Olivuzza, Palermo (building and interiors)
- 1899–1900 Grand Hotel Villa Igia, Palermo (building and interiors)
- 1901 Utveglio House, Palermo (building and interiors)
- 1902 First International Arts Exposition, Turin (furnishings for the Ducrot stand)
- 1902–27 Palazzo Montecitorio (now Parliament Building), Rome (additions and interiors)
- 1903 Villino Basile, Palermo (building and interiors)
- 1904 City Hall, Licata (building and interiors)
- 1906 Palazzo Bruno di Belmonte, Spaccaforro (building and interiors)

- 1914 Municipal Palace, Reggio Calabria (building and interiors)

Basile designed the furniture and fittings for many of his buildings. He designed furniture and fabrics for Ducrot, 1899–1909.

Bathrooms

It is well known that the Greeks and the Romans took matters of personal hygiene seriously and adopted practices designed to promote health. The Minoan Palace of Knossos was equipped with bathtubs and running water (1600 BC), public toilets have been excavated in the ancient Greek city of Corinth, and every Roman city from North Africa to England had its public baths. But little is known about the origins of the domestic bathroom, in Europe at least, before the end of the 16th century.

During the 17th century matters of personal hygiene were dealt with in a variety of ways, but by the end of the century it was rare to find a bathroom, even in an important house. This does not mean to say the washing of the body was not important. In Britain and other European countries, at the upper end of the social scale, servants brought basins and ewers to a

Bathroom at Ashley Place, London, 1893

room where washing could take place and the items were taken away afterwards. The same situation applied to the wooden or copper bath tub used for bathing which was again removed after use. There is evidence to suggest at least some of the grand Elizabethan prodigy houses had bathrooms of a sort and attention has been drawn to Sir Francis Willoughby's plunge bath constructed in the sandstone underneath Wollaton Hall, Nottingham, in the 1580s (Beard, 1990).

In the second half of the 17th century bathrooms were beginning to be installed in grand properties, but they were still rare. During the 1670s a luxury *appartement de bains* was fitted at Versailles for Madame de Montespan, the king's mistress. In Britain, at a slightly later date, the Duchess of Lauderdale was busy developing the amenities at Ham House in Surrey and a small bathroom was installed which could be approached from her bedchamber via a spiral staircase. This was, however, a modest affair compared with the one constructed at Chatsworth House in Derbyshire which was probably there to impress visitors as much as anything else. Celia Fiennes noted in her journal that the room was luxuriously furnished with marble and had a white marble bath big enough for two people. Yet such rooms were definitely the exception rather than the rule and the bathroom as we know it did not make its appearance until well into the 19th century. The technology to raise water above ground level was available, but architects building country houses, in Britain at least, did not install running water above the ground floor; "cheap labour was available to transport water to all parts of the house and cold baths were regarded as efficacious to health" (Beard, 1990).

By the end of the medieval period most houses of any significance in Britain and on the Continent had primitive drainage systems of some sort to deal with the disposal of night soil. Small privies on upper floors were often connected by chute to the basement area and thence to an underground cesspool. Chamber pots were, however, extensively used by the more important members of a household, brought and taken away by servants and often kept in the pantry when not in use. The close stool was a more substantial alternative and consisted of a type of box with a lid which opened to reveal a ring-like seat over a fitted pan. In general they were relatively simple in terms of their form and construction but occasionally they could be more luxurious: an inlaid version is recorded at Hardwick Hall and a red velvet-covered example at Hampton Court. They are frequently mentioned in inventories from the period and seem to have been associated with, although not located in, bedchambers. At Bolsover Castle, Derbyshire, close stool rooms were located in corner turrets; at Ham House the same type of room could be found in small cubby holes behind wall hangings in two of the antechambers; at Petworth House the close stool rooms were located off a staircase. In France the small rooms which housed close stools were known as *garde robes*, which translated into English means wardrobe, literally rooms in which household effects were stored. On both sides of the channel these little rooms were the forerunners of the lavatory as we know it today and in France the term *garde robe* is still used to identify the room containing the toilet. Plumbed toilets with a flushing system were not introduced into houses until the second half of the 18th century. Toilets incorporating an S-bend filled with water were in use by 1775,

following the patenting of such a device by Alexander Cumming, and a flushing water closet operated by a lever at the side was patented by Joseph Bramah in 1778. He installed flushing toilets at Audley End House in Essex in the 1780s using water from tanks installed on the roof. Again, however, progress regarding the installation of flushing toilet systems was slow and they did not become widespread until the second half of the 19th century.

Before 1870 bathing largely took place in a bedroom or dressing room using a receptacle brought in by servants and filled with water in the same way. Sponge bathing, which involved washing oneself with a sponge while standing in a shallow, water-filled tray, was a widespread practice, though hip baths, which allowed partial immersion of the body, provided a popular alternative. During the 19th century portable showers, which consisted of a tent-like structure erected temporarily in the bedroom with a water filled tank above, allowed the person taking the shower to pull a string which released the water which was eventually collected in the tray. It must have been a difficult process to control and an awkward one for the servants to arrange and manage. The development of plumbing technology, which allowed for the installation of a fixed-pipe hot water system, was introduced about 1870, and from this time bathrooms became, increasingly, a permanent feature of many homes in Britain. By 1900 only the smallest of houses in London were without a bathroom and the widespread adoption of this facility was fostered not only by the desire for status and "keeping up with the Jones's", but also by a positive attitude to hygiene and the prevention of ill-health.

Hot water heated in the kitchen area of the house by a solid fuel range could be piped to a reservoir tank in an airing cupboard and fed into wash basins, showers and bath tubs by a piped system with taps. Baths of the shape and type we are familiar with today were plumbed in and made of enamelled cast iron after 1880 and they could be either free-standing on elaborate feet or encased in mahogany. Houses belonging to people from the upper end of the social scale often had, in addition to the bath, plumbed-in shower units which provided horizontal and overhead jets of water.

Initially, bathrooms were created by converting bedroom space and they were relatively spacious rooms. They were looked upon as rooms to be furnished like any other rooms in the house and fireplaces, free-standing furniture including washstands, towel rails and small cupboards, ornamental woodwork, wallpaper, curtains and carpets were all introduced into furnishing schemes. Trade catalogues produced by firms such as Shanks of Barrhead in Glasgow and Doulton of Staffordshire showed spacious bathroom arrangements in their coloured illustrations. Even when bathrooms had become the norm in middle and upper class homes, however, many ladies continued to use their own bedrooms for washing. The Hill House at Helensburgh, in Scotland, designed by Charles Rennie Mackintosh for Mr. and Mrs. Blackie in 1904 and regarded as avant-garde by contemporary standards, had a significant house bathroom with bath and elaborate shower. The bedroom, however, just across the corridor, included a Mackintosh-designed washstand with beaten metal ewer and basin for Mrs. Blackie's use.

Even after the advent of the house bathroom in the 1870s,

it was unusual for the lavatory to be situated in the same room as the washing facilities, and indeed such an arrangement was frowned upon as being unhygienic and inappropriate. The toilet, it was recommended, should continue to be housed in a separate room. Water closets of a kind had been known and used since the end of the 16th century, but it was during the 19th century that the flushing toilet became a common feature of many homes in Britain, coinciding with the introduction of effective systems for the disposal of sewage which were implemented under the Public Health Acts of 1848 and 1870. The washdown toilet pan was developed, refined and patented towards the end of the 19th century and it still functions well at the end of the 20th century; the need for overhead cisterns, however, has long since disappeared as more efficient systems have been developed. While middle-class homes in the developing urban suburbs had bathrooms and toilets installed as a matter of course, many working-class homes went without such amenities until well into the 20th century, and it is only in recent decades that indoor toilets and bathrooms for all sectors of the population have come to be taken for granted.

Towards the end of the 19th century bathrooms shrank in size, and after 1900 they took on the more clearly defined look we recognise today. The elaborate bathroom furnishings of the 1880s were replaced with a simpler, more hygienic look, characterised by white fittings attached to the wall, walls with marble facings or washable tiles, washable wallpaper of tile design and marble tiled, cork or tile designed linoleum. These simpler schemes reflected the functional nature of the bathroom as well as promoting the notion of the hygienic home. In 1904, Hermann Muthesius praised the English for leading the way in the development of bathrooms, pointing out that bathrooms were being taken for granted in the United Kingdom when they were the exception rather than the rule in Germany.

By the middle decades of the 20th century Europe had been overtaken by America in matters of domestic hygiene, and 93.5 per cent of American urban dwellings had running water, 83 per cent had indoor toilets, and 77.5 per cent had bathing facilities by the 1940s. Yet, the provision of such facilities was a comparatively recent phenomenon. Baths had been a rarity in early and mid-19th century private homes and although American architects had begun to include bathrooms and water closets in their house plans during the 1850s and 1860s, their use was restricted to the wealthier sections of society. Andrew Jackson Downing's influential *Architecture of Country Houses* (1850), for example, included bathrooms and water closets in eight of thirteen villa designs whose building costs were estimated at between \$4,600 and \$14,000, but in only one of the thirteen cottages illustrated. His and other pattern books of the period suggest that prosperous families living in rural or suburban areas fared better than their urban counterparts; in 1855 New York had only 1,361 baths to serve a population of 629,904 (Winkler 1989). Many of these baths were made of sheet metal and their surfaces were painted. By the 1870s cast-iron tubs with enamelled interior surfaces were available; the first were produced by the J.L. Mott Iron Works of Mott Haven, New York, in 1873. Mechanical flushing devices for toilets were also introduced during this period and by the late 1880s American manufacturers had perfected the porcelain, free-standing form whose basic design provided the model for many variations still in use today. The increasing

popularity of one-piece, built-in baths and sinks towards the end of the century prepared the way for later modern, *streamlined* American bathrooms.

During the 20th century the bathroom has evolved at a relatively gentle pace and many of the features of bathrooms developed in the early decades of the century are recognisable in those in use today, even in bathrooms that have been recently installed. The concern for bathrooms to be functional and hygienic is as important now as it was in the early 1900s; washable surfaces are still seen as a priority. The variety of ceramic tiling and washable wallpapers available today is staggering, offering the consumer a wide choice of styles to suit personal tastes. It is interesting to note that as the Victorian period has been looked upon more favourably in recent years, so modern bathrooms have taken on a more late 19th century look. The desire for period detailing has given rise to a whole industry concerned with the reproduction of baths and bathroom fittings in the styles of the late 19th century with whirlpool technology available as an optional extra.

J. IAN COX

Bauhaus

The German school of the Staatliches Bauhaus was founded in 1919 in Weimar, a town in East Germany. The school's first director was Walter Gropius (1883–1969) and the opening sentence of the Bauhaus manifesto, issued by Gropius in the founding year, set the educational goal: "The ultimate aim of all visual arts is the complete building!"

Throughout its existence (1919–33) the school's program was about bringing together all creative effort into one whole, to reunite all the disciplines of practical art – sculpture, painting, and crafts – as inseparable components of a new architecture. Architects, painters, and sculptors have always been craftsmen in the true sense of the word, hence a thorough training in the crafts was required of all students as the indispensable foundation for artistic production.

Bauhaus students began the course work with the *Vorkurs*, a basic design course of color and form, designed to assess and unleash their creative potential. The *Vorkurs* was unique in the quality of its theoretical teaching and the intellectual rigor with which it examined the essentials of visual experience and artistic creativity. Studio instruction covered architecture, painting, and sculpture, including all branches of the crafts. Students also took craft training, drawing, and painting (this department included the design of furniture and practical articles), and training in science and theory. What made the real difference, however, were the influential instructors Gropius brought to the school, among them Johannes Itten, Lyonel Feininger, Gerhard Marcks, Oskar Schlemmer, Georg Muche, Paul Klee, Wassily Kandinsky, László Moholy-Nagy, and Josef Albers.

Two international events took place at the Bauhaus in Weimar. One was the 1922 Constructivist and Dadaist Congress organized by Theo van Doesburg, a founder-member of the Dutch De Stijl group, with participants including El Lissitzky, Tristan Tzara, and Hans Arp. This confirmed the Bauhaus connections with the European avant-garde. The other event was the 1923 Bauhaus Exhibition which coincided with the annual Werkbund Conference, attended by no fewer than 15,000 people. Attending celebrities included Igor Stravinsky, and lectures were given by Gropius, Kandinsky, and J.J.P. Oud, and Schlemmer's *Triadic Ballet* and *Mechanical Ballet* were performed. The experimental house "am Horn" demonstrated most eloquently the capabilities of the school. Designed by Georg Muche, it was an exercise in the collaboration of the arts and crafts and a prototype of an inexpensive, mass-produced structure using the latest materials: a simple cubic mass framed in steel with a concrete infill. The innovative interiors were carried out entirely by Bauhaus workshops. The lighting fixtures, made in the metal workshops, were designed by Moholy-Nagy and the furniture designed by Marcel Breuer, at the time still a student. His kitchen design (1923) was truly revolutionary – a continuous work-surface with cabinets above and below, following the wall around a corner, and with the main work space in front of a window.

In 1925 the Bauhaus left the building in Weimar, designed in 1904–11 by Henry van de Velde, and moved to Dessau, where the city financed the construction of the school and housing for the instructors. The new building, designed by

Walter Gropius in 1925–26, consisted of three wings: a school of design, workshops, and a student dormitory, the first two linked by a bridge over the street. In the bridge were the administrative offices, club rooms, and the office-studio of Professor Gropius. The atmosphere in Dessau was quite different from that at Weimar, and the Gropius building was streamlined, functional, and assertively modern inside and out. In Weimar the crafts lived on in a rejuvenated fashion; in Dessau a new kind of industrial designer was being trained. Now, however, the young masters taught in new ways and introduced new activities; former students were elevated to teaching positions: Herbert Bayer, Marcel Breuer, Hinnerk Scheper, Joost Schmidt, and Gunta Stölzl.

Oddly enough, until 1927 the Bauhaus lacked an architecture department. Gropius initially approached a reluctant Mart Stam, but the chair in architecture was eventually accepted by Hannes Meyer (1889–1954). Meyer's approach was different to that of Gropius. Of a leftist political philosophy, Meyer believed that the architect's job was to better society by designing functional buildings which would improve the condition of the common man. Under Meyer the architecture department assisted Gropius with commissions, including an experimental social housing project in the Törten-Dessau. The rationally planned housing estate was designed with standardized components, manufactured on-site for speed and economy of production and reduced transport costs.

Gropius resigned from the Bauhaus in January 1928 to return to full-time architectural practice. When Mies van der Rohe, his first choice for successor, declined, he named as director Hannes Meyer. Now the Bauhaus workshops conceived designs and products for sale to industry, making inexpensive and mass produced essential items like furniture. Town planning was taught by Ludwig Hilbersheimer (1885–1967). Meyer and Hilbersheimer encouraged the architecture students to concentrate not on a single family home but on the problems of mass housing. Despite the fact that the school, under the leftist Meyer, benefited from the success of the capitalist system and was in a good financial situation, Meyer's Marxism played into the hands of Bauhaus opponents. The Bauhaus in Dessau was accused of becoming a nest of Bolsheviks, and Meyer was forced out of the school, to the satisfaction of his adversaries. Meyer and a collective of loyal students left Germany for the Soviet Union and Meyer remained in Russia until 1936.

Mies van der Rohe (1886–1969) who replaced Meyer in August 1930, believed that architectural training was central to the school's curriculum. He created the department of interior design which combined the furniture, metal, and mural painting workshops, chaired by his collaborator Lilly Reich (1885–1947). In his teaching Mies stressed formal qualities and demanded elegance and aesthetic correctness.

The Nazis accused the school of being cosmopolitan and anti-German, equating Modernism with Communism. The school in Dessau was closed in September 1932 but Mies reopened the Bauhaus in Berlin, hoping to survive on income from patents, patrons, and student fees. When Hitler became Chancellor, Modernism was declared degenerate and all Modernists were banned from public activity. In April 1933, Staatliches Bauhaus finally closed.

Walter Gropius, Marcel Breuer, and Mies van der Rohe had

Bauhaus: Director's Office by Walter Gropius, 1925

considered furniture as integral to a unified architectural concept. Designs such as the *Barcelona* chair and the *Barcelona* ottoman of 1929, the cantilevered *Weissenhof* chair of 1927, the *Brno* chair of 1930, *Tugendhat* chair of 1930, *Wassily* chair of 1925, and the *Cesca* chair of 1927 were initially created within the context of specific interiors. They were included in the Bauhaus buildings of Dessau (1926), in the housing units at the Weissenhofsiedlung (1927), the German Pavilion at the Barcelona International Exhibition of 1929, and in Mies van der Rohe's Villa Tugendhat in Brno, Czechoslovakia (1930). The spatial experience was conceived as continuous, with interior and exterior to be integrated both visually and physically.

In 1925, inspired by the handlebars of his Adler bicycle, Breuer was the first to incorporate resilient tubular steel in the design of chairs with the *Wassily* chair, named after fellow teacher Wassily Kandinsky. The discovery of the chromed steel frame as a primary furniture structure led to further innovation. The pure geometry and clarity of form were achieved with the separation of the supporting and supported elements. Consequently, in line with the Modernist philosophy of honesty of expression and design solution, the furniture was reduced to essentials.

The invention of the cantilever chair, the chair without rear legs, was a symbolic event as well as a technological feat. The continuous loop of the tubular steel frame was a logical result of material properties and production techniques. The lack of legs eliminated all associations with the archetypal chair, the symbolic seat of paternal authority. The abolition of the solid, rooted supports, on which the primeval ruler elevated himself above his subjects, amounted to a democratizing gesture which rejected past hierarchical orders.

At the Weissenhof Siedlung exhibition, Mart Stam first displayed his gas pipe cantilevered side chair S33 of 1926. The chair was initially manufactured by L. & C. Arnold company, then reissued by Gebrüder Thonet. Mies van der Rohe also exhibited a cantilevered chair, Model No. MR 10, later named the *Weissenhof* chair, with steel tubes bent at the front into a coil that exploited the spring principle for resilience. A year later, in 1928, Marcel Breuer produced two more cantilever chairs, the Model No. B 32, named the *Cesca* after his daughter Francesca, and the Model No. B33, a derivative of the Mart Stam Side Chair. The chairs were manufactured by Gebrüder Thonet.

A number of the Bauhaus masters escaped the persecution of the Nazis and emigrated to the United States. Their arrival was prefaced by the 1932 exhibition on the new International Style, organized by Philip Johnson and Henry-Russell Hitchcock, held at the Museum of Modern Art in New York. This served as a catalyst for American architects to adopt the avant-garde style. Gropius, Breuer, Mies van der Rohe, Hilbersheimer, Moholy-Nagy, Bayer, and Albers settled in America where they profoundly influenced the building arts and their teaching.

While Thonet resumed production of the Bauhaus-era furniture in Europe after World War II, the products were introduced to the United States by Knoll Associates, known since 1957 as Knoll International, through the personal contact of Florence Knoll with Mies van der Rohe who was her professor at the Illinois Institute of Technology in Chicago.

During the 14 years of its existence, the Bauhaus succeeding in unifying the arts, and revolutionizing the world of industrial design and mass production. Never before, and perhaps never since, has there been such emphasis on the coexistence of artist and craftsman, designer and technician.

Beckford, William 1760-1844

British antiquarian and connoisseur

Acutely sensitive to beauty as well as highly intelligent, William Beckford developed a lifelong interest in and knowledge of the arts, which helped to make him one of the most celebrated connoisseurs of his time. He also played an important role in the development of Antiquarianism in the late 18th and early 19th centuries, and the unique interiors that he created at Fonthill show him to have been a pioneer in the revival of Gothic styles of decoration and furnishing.

The circumstances of Beckford's birth and early upbringing made a significant contribution towards the formation of his wide-ranging collections and the settings he devised to show them off. As the sole heir to great wealth he was able to satisfy whatever desire he might have: either to acquire beautiful objects, or to erect buildings in which to display them, or to

Beckford: south end of St. Michael's Gallery, Fonthill, from *Graphical and Literary Illustrations of Fonthill Abbey* by John Britton, 1823

landscape the surrounding countryside. The atmosphere of costly magnificence that characterised Fonthill Splendens, his father's Palladian mansion in Wiltshire where he grew up, had a powerful effect on the formation of his own taste. In many ways it presented an ideal to strive to emulate, and at the same time, owing to a streak of perversity in Beckford's nature, something to react against. At first, on his coming of age, he was content to call in the architect John Soane to make small changes to the interiors at Splendens. By the mid-1790s, however, after he had returned from his enforced stay abroad, he decided to create a building in an entirely fresh style which should quite outdo Splendens in grandeur of conception. Over the next two decades, on one of the ridges of the Fonthill estate, he and his architect James Wyatt between them constructed an enormous neo-Gothic country house, Fonthill Abbey.

As its name implies, the Abbey was designed to suggest a monastic pile of the Middle Ages, though adapted to the needs of modern secular living. Like his near contemporary, Horace Walpole, Beckford wanted to incorporate in the interior design of his house faithful imitations of key elements from the late Gothic period: hence the fan vaulting in the Octagon under the

central tower, and in three of its great arches the stained glass windows (commissioned from the firm of Francis Eginton and Son) which probably were influenced by Beckford's memory of those he had seen at Batalha Abbey in Portugal. In the two main galleries leading north and south from the Octagon further examples of stained glass and architectural features of Gothic inspiration again helped to reinforce the medieval atmosphere. The fan-vaulted ceiling of St Michael's Gallery, for instance, modelled in stucco, and painted and jointed to resemble stonework, was based directly on that of the Henry VII Chapel in Westminster Abbey.

In his overall scheme for the two galleries, however, Beckford subtly transformed the allusions to the Middle Ages from the religious and monastic to the knightly and chivalrous, with a linked heraldic and genealogical theme which allowed expression of all his most lofty pretensions to rank and his passion for heraldry. St Michael's Gallery was named for the knights of that order, from whom he claimed descent; and the other gallery (named for King Edward III) had at its centre a portrait of the king in his role as founder of the Order of the Garter. Here the arms of Beckford's gartered ancestors (he maintained he could trace his lineage back to John of Gaunt)

were represented in the frieze of the entablature, while his own favourite devices of the Latimer cross and the Hamilton cinquefoil adorned the ceiling and formed the pattern of the carpet as well as being repeated even in the carving of the furniture

The whole decorative design – which might otherwise have appeared too severe and formalised – was brought alive by Beckford's individual touch, his flair for theatrical presentation. Since his early days at Splendens he had had a penchant for the exotic effect of brilliant colours. Now he could indulge it, allowing the crimson carpet to vie with the scarlet draperies that framed each of the bookshelf compartments, and setting off the scene with curtains of crimson and royal blue or purple trimmed with gold. At night the drama was heightened when candles were lit along the combined length of the two galleries, and their light reflected back again by the glass in the windows. The chief function of the galleries was to act as libraries, housing Beckford's magnificent collection of books: even here, though, the appearance of the fine calf bindings, stamped with the family crests and the ubiquitous cinquefoil, served a decorative purpose. Indeed the galleries provided a setting not only for his books but for all the other kinds of precious objects in his wide-ranging collection: Old Master paintings, ceramics both European and Oriental, silver and silver gilt, lacquer, ivories, enamels, hardstones mounted in superb metalwork. The cumulative effect was marvellously rich and eclectic, informed by Beckford's talent for securing pieces of quality, whether a priceless medieval *chasse* from the treasury of St Denis (put up for sale during the French Revolution) or a Florentine *pietre dure* table top which had been brought to Paris by Napoleon as part of the spoils from his Italian campaign.

In providing furniture for the galleries Beckford not only chose genuine antiques, but also commissioned pieces of antiquarian design which would accord with the prevalent late medieval atmosphere, suggesting a return to a vaguely defined point in the past when the Gothic was just giving way to Tudor Renaissance. By way of contrast, however, there was one particular room at the Abbey – the Grand Drawing Room, one of the last to be completed – where the decor and furniture owed inspiration to a single source – France – with superb examples ranging in period from the Rococo to the Neo-Classical, right up to the contemporary style of the First Empire. We owe our detailed knowledge of the layout and appearance of the interiors at the Abbey to the descriptions and illustrations in important books by John Britton and John Rutter which were published in 1823, just after Beckford had taken the decisive step of selling Fonthill to John Farquhar and had retired to Bath.

Although his achievements in Bath during the last twenty years of his life were inevitably on a smaller scale than before, yet the same traits which had been apparent in the decor and design of the monumental apartments at Fonthill Abbey were distinguished by observant visitors such as Henry Lansdown and Dr Waagen who came to admire Beckford's houses in Lansdown Crescent as well as the Neo-Classical Tower he had built at the highest point of his property on the hill behind. Dr Waagen commented on the exquisite taste which characterised the selection and display of the variety of pieces in his collection, while Henry Lansdown noted the effectiveness of

Beckford's bold colour schemes and his dramatic use of drapery. In 1844, only a few months after Beckford's death, Edmund English brought out his *Views of Lansdown Tower*, illustrated by lithographs after originals by Willes Maddox. These reveal how the two main reception rooms – the Scarlet Drawing Room and the Crimson Drawing Room – and its two libraries managed to echo in miniature many of the preoccupations with colour and arrangement already seen at Fonthill. Even certain pieces of furniture, such as the chairs of "Fonthill design" depicted in the illustrations, hark back to the earlier period. Beckford, however (as James Lees-Milne has pointed out), would never allow his collections or his ideas about presenting them to remain static. Even in extreme old age he would be found trying out something quite novel, often perverse. As late as 1841 he had sold a number of his choice examples of 18th-century French furniture, to be replaced at the Tower by the cabinets, showcases and sideboards represented in the illustrations. In his correspondence of the time there are references to the creation of these new pieces in collaboration with his architect Goodridge, and directions as to how they should be made up in English's workshop.

Throughout his life Beckford had been in the forefront of taste, particularly with his imaginative reworking of themes from the Middle Ages both in architecture and interior design. He was also an original, imparting to his decorative schemes an individual touch of the theatrical and occasionally outrageous, which he maintained right to the end.

PHILIPPA BISHOP

See also Antiquarianism; Gothic Revival

Biography

Born at Fonthill Splendens, Wiltshire, 29 September 1760, son of the millionaire Alderman Beckford, Lord Mayor of London. Inherited a vast fortune on the death of his father in 1770; educated by private tutors and taught drawing by Alexander Cozens and music by Mozart. Married Lady Margaret Gordon, 1783 (died 1786): two daughters. Lived in Switzerland 1785–86; travelled to Spain and Portugal, 1787. Returned to England and commissioned the building of Fonthill Abbey, Wiltshire, from 1794; retired to Bath and built the Lansdown Tower, 1824–27. Member of Parliament for Wells, 1784–90; for Hindon, 1790–94 and 1806–20. Published several books during the 1780s and 1790s including the novel *Vathek*, 1786. Died in Bath, 2 May 1844.

Principal Works

Much of Beckford's prodigious collection of books, paintings and works of art from Fonthill Abbey was sold in 1823. Full details of the sale appear in Gemmett 1972; several items are now in the Victoria and Albert Museum. Lansdown Tower, containing some surviving interiors, is managed by the Bath Preservation Trust. A large collection of Beckford's papers is in the Bodleian Library, Oxford.

Bedrooms and Bedchambers

Given that human beings spend approximately a third of their lives in bed, it is not surprising to learn that the bedroom has occupied a significant position in the evolution of domestic living space in western culture. Its relative importance as a room within the home has, however, changed over time, and present-day conceptions of the bedroom as a private space for

sleeping and intimacy are not always appropriate when considering the history of this room-type.

While bedrooms were a feature of some larger ancient Greek and Roman dwellings, the idea of a separate and distinctive bedroom to house a bed and thus afford a degree of privacy for the occupants does not appear to have occurred in the development of British homes until the mid-16th century. From the end of the medieval period until that time, the more significant members of a household slept in a bed in the corner of a room, or in an alcove. Such a room, known as a chamber, provided the occupant, or occupants, with a little privacy, but the room was essentially a multifunctional one affording accommodation for sitting, relaxing, studying, entertaining and sleeping – a type of bed-sitting room in fact. General purpose rooms of this type were common in the homes of the well-to-do throughout Europe at this time. In Britain, by about 1550, however, there is evidence to suggest bedrooms, or bedchambers as they were known, had come into common usage. Essentially, they represent the further separation of the chamber into the withdrawing chamber and bedchamber, the former a type of private sitting room and the latter a room containing a bed and largely for sleeping in. At Hardwick Hall, Derbyshire, built by Bess of Hardwick at the end of the 16th century, the pattern of important state rooms on the second floor involving the High Great Chamber, Withdrawing Chamber and the best Bed Chamber, reserved for the most important of guests, reflects the development of the bedroom in Britain up to this point in time.

In France the evolution of the bedchamber followed a different path, leading to an end result that was to prove influential abroad. In the early 17th century the French *chambre* was still a type of grand bed-sitting room in important houses, fulfilling all of the functions outlined above. The bed was the most significant item of furniture in the room and was often placed in an alcove. The room giving access to the *chambre* was a type of anteroom for visitors to the *chambre* to wait in before admittance, and leading off the *chambre* there would be a small *cabinet*, which compared with the anteroom was an essentially private room for the principal occupant of the *chambre* containing his or her most personal possessions. This suite of rooms, often directly linked to an important *salle* or saloon that fulfilled many of the functions of the hall in great English houses, gave rise to the so-called French apartment system that was closely linked to patterns of formal social behaviour established at the French court by Louis XIV at Versailles. In this system, the bedchamber became the innermost formal room of reception, and high-ranking individuals received visitors while in bed. The *coucher* and *levée* of the king were significant social rituals involving responsibilities designated to favoured courtiers. Tasks such as presenting the king with his night cap, conferred privilege and status on the person who carried out these duties and some responsibilities were regarded as more important than others. Such a system of access to the apartment and the bedchamber also conferred considerable importance on the bedroom as a room of reception and this was reflected in the elaborate schemes of decoration developed to reflect its position in the formal sequence of rooms.

The Continental apartment system developed in France influenced the evolution of the bedroom as a distinct room

Bedrooms: Blue Bedroom, Hardwick Hall, Derbyshire, late 16th century

with formal social functions in Britain, especially after the restoration of the monarchy in 1660. Here the bedchamber in important houses was always less public than it was in France, but in aristocratic circles French conventions were followed and in a number of the royal palaces bedrooms were established in the French manner with the bed strategically placed behind a balustrade. Surviving records indicate Charles II operated a system of privileged access to state bedrooms along the lines of the system practised in France. The majority of bedrooms established in this manner have long since disappeared, but an interesting example survives at Powys Castle in Wales, where the state bedroom was decorated for Charles II in about 1665.

The formal apartment system involving a suite of rooms leading off a central reception room influenced the development of house plans in Britain in the latter part of the 17th century. Good examples of this kind of arrangement can be seen today at Ham House in Surrey and at Hopetoun House in Scotland, although it must be stressed that the functions of these rooms and their furnishings have changed since their original designation. Not surprisingly, important bedrooms of this type were decorated lavishly with furnishings reflecting the importance of the rooms as rooms of reception. Beds had become highly prized pieces of furniture during the 16th century, as aristocratic life became more static. During the 17th

century this tradition continued as architects and upholsterers chose to emphasise the bed as the focal point of a bedroom, giving the frame an architectural flavour and providing rich and expensive sets of hangings and covers. Most beds now stood with the head against the wall and the decorative treatment of the bed often influenced the decoration of an entire bedchamber, which tended to be furnished and decorated in a lavish but formal way with expensive suites of furniture consisting of chairs and stools lined up against the walls. Even in bedrooms that did not quite fit the state apartment category, beds were highly prized pieces of furniture with costly sets of hangings.

In the 18th century, in Britain at least, the nature of country house life changed and the important members of a household spent more of their time in designated public rooms and less time in apartments. The consequences of this change in social behaviour had repercussions for the planning of room layouts in country houses. More emphasis was given to the public rooms, and as a result the apartment diminished in significance, although it did not die out altogether. Instead, the apartment tended to evolve into a small suite of rooms involving a dressing room, bedroom and possibly a small closet. Apartments for important guests might involve two dressing rooms, one for the gentleman and one for the lady. Bedrooms thus became increasingly rooms for sleeping and intimacy, and

the dressing room, often furnished as a sitting room or study, provided accommodation for social rituals associated with the toilet, getting dressed or preparing for bed.

Bedrooms were, by this time, becoming more private spaces and this is reflected in the number of bedrooms to be found on the first floor of houses built or developed during this period. State apartments could, however, still be found on the ground floor and a state bedroom might still be located at the end of an *enfilade*. The state apartments at Hopetoun House, designed by William Adam and decorated by his son John in the 1750s, culminated in an important state bedroom with dressing room attached; the focus of the main room was still a lavishly upholstered and draped state bed. By about 1770, however, state apartments organised along traditional lines were going out of fashion and state apartment rooms were being redecorated and furnished to provide the types of rooms that were in demand. Many ground floor state bedrooms thus changed function and what had been important state beds were removed to bedrooms upstairs. The state bed at Wimpole Hall, Cambridgeshire, was taken upstairs in 1781, and the same thing happened at Petworth in Sussex at about the same time. At Hopetoun the state bedroom was converted to a dining room at the beginning of the 19th century. By the end of the 18th century bedrooms, even the best ones, were nearly always located upstairs, and the bed, although still usually a four-poster with hangings, had declined in importance as a status symbol. Bedrooms had become rooms for sleeping in and they were furnished accordingly.

In the 18th century urban town house bedrooms were more often than not located on the first and second floors and beds were often placed in alcoves let into one wall. Plans and extant examples relating to town houses in London, illustrating this type of arrangement, survive to the present day, and it is interesting to see the continuing evolution of a practice that originated in medieval times. By the end of the 18th century bedrooms in homes at the upper end of the social scale were furnished comfortably with carpets and curtains and the most precious item of furniture (despite that fact that it was no longer the most important of status symbols) was still the four-poster bed with its related hangings. Both Chippendale and Sheraton included designs for beds in their influential pattern books. A gentleman's bedroom in a small town house of the period would probably have also contained items of furniture such as a mahogany clothes press, a dressing table and a cabinet which would have opened to reveal emplacements for a ewer and basin and a sliding shaving mirror.

In both town and country houses, the practice of locating bedrooms on the upper floors continued throughout the 19th century. The principal bedroom was normally located on the first floor and the 18th century practice of placing dressing rooms nearby continued. Increasingly the bedroom became the domain of the lady of the household, and although married couples still slept together, it was normal for the gentleman's dressing room to adjoin the main bedroom. There was also a growing tendency to site children's bedrooms near that of their parents when space permitted, although in town houses children's bedrooms had to be located on the floor above. In large houses there were separate corridors for the bedrooms of bachelor and lady guests. As guests were now expected to spend more of their time in the public areas of a house, these

bedrooms were furnished with a desk and comfortable chairs in addition to the usual bedroom furniture but they were not expected to function as sitting rooms.

During the first half of the 19th century concern for the provision of a hygienic sleeping environment became manifest, a response to the large numbers of deaths caused by infectious diseases such as cholera. Bedrooms were perceived as possible havens of infection and there was a corresponding tendency to furnish them simply, a trend that was to develop as the century progressed. During the early decades of the century the bed was still of the four-poster variety, though half-tester beds where the canopy extended halfway down the length of the bed, also became popular. As health concerns came to the fore, beds of this type began to be replaced by metal bedsteads and by the 1870s four-posters and half-testers had become less desirable and were regarded as old-fashioned.

Many of the manuals of household taste – books of advice published for the edification of the female homemaker – made recommendations about the types of fabric which should be used for drapes, curtains and covers for the bed, and self-patterned cottons combined with lace were popular choices. Wallpapers were also common with an emphasis upon small, retiring patterns that would not hinder rest. Furniture for the bedrooms tended to be on the plain side compared with the heavily ornamented furniture found in downstairs rooms; a large wardrobe combined with a chest of drawers and a washstand, plus a couple of chairs would have generally sufficed. The wardrobe was often the largest piece of furniture in the room and was often constructed in three sections, one third of the space being for hanging and two thirds for underclothes and accessories. The door to the central compartment usually contained a mirror on the outside for dressing purposes. Mahogany was popular for bedroom furniture, but oak was also selected and indeed recommended by design reformers such as Charles Eastlake in his *Hints on Household Taste* (1868).

As bathrooms were still scarce, the washstand was an important item and many had marble tops and tiled backs to facilitate wiping down. Members of the household often washed in the bedroom or dressing room, so ceramic toilet sets were ubiquitous in these rooms. Eventually the washstand was replaced in many middle and upper class homes with a plumbed-in wash basin perhaps located in the corner of the room. Again, in an attempt to keep dust levels down and to promote a healthier environment, bedroom floorboards were scrubbed, swept and left uncarpeted, although rugs and carpet squares were used extensively to enhance the comfort of the room. Suites of matching bedroom furnishings designed in a variety of styles including the Queen Anne and Japanese were available from commercial manufacturers from the 1880s. And, towards the end of the century, furnishings became simpler still: it was not uncommon for bedrooms in progressive households to be painted white, a sure way of allowing accumulations of dust to be noted. Fitted furniture also became popular from about 1880 and was promoted by arbiters of taste such as R.W. Edis as being space-saving and hygienic. Hermann Muthesius noted the presence of fitted, built-in bedroom cupboards and dressing tables in many of the late 19th century houses that he visited and commented on their value in providing useful storage space, thereby helping to

eliminate clutter (*The English House*, 1904). The same author summed up the character of the typical turn-of-the-century bedroom by noting that ideally it should foster a healthy environment but at the same time provide a room that the lady of the house could use as a private retreat in the absence of a boudoir.

In many ways the 20th century has seen few dramatic or overall changes in the evolution of the bedroom as a room type. Bedrooms have, however, tended to become smaller in size and fewer in number as the average family size has declined and separate dressing rooms have until recently all but disappeared. Styles of decoration and furnishing have altered as a variety of waves of popular taste have all had their effect on this room. As standards of living have risen in the post-war period, increasing amounts of disposable income have been expended on the decoration and furnishing of this type of domestic space. Particularly noticeable in recent years has been the fashion for "retro" styles, especially Victorian styles, and bedroom decoration has been much influenced by designer retailers such as Laura Ashley. Even in the 1990s, the fashion for bedroom furniture made from pine with complementary polished floorboards, rugs and chintz co-ordinated soft furnishings does not look like fading. It is interesting, however, that the country or vernacular look has not ousted the desire for comfort, and many contemporary bedrooms are centrally heated. In the same vein new house specifications are including master bedrooms with walk-in wardrobes and separate dressing rooms, sure signs not only of *fin de siècle* luxury but also another example of a revival of a custom that went out of fashion in the early part of the century.

Beds

Beds in their simplest form are just raised platforms designed to support a reclining body. As old as the chair, they have also gone through an astonishing number of variations on the basic theme. In addition to reflecting the generally prevailing tastes of a period, they have also been associated with particular styles of textile draperies or added detail while the essential sleeping platform has substantially remained the same.

In ancient Egypt, beds were initially crude wooden frames lashed together, developing into sophisticated jointed frames, complete with a proper suspension system of leather thongs. These Egyptian beds were supported on short legs, usually in the form of a bull's foot and were often supplied with a separate head-rest, as headboards were uncommon. Examples of royal furniture have survived and demonstrate a high degree of design sophistication. The gold-covered canopy for Queen Hetepheres illustrates this. Designed as a simple frame with hooks for net curtains for the top and sides, it could be assembled or dismantled at will.

The Egyptians established type forms for beds that have remained ever since. Along with the simple supporting frame type, and the canopied bed, a version of a folding bed was found in the tomb of Tutankhamun.

In Classical Greece and Rome, the bed developed into a couch which was also used for reclining upon at mealtimes. Styles varied from simple bed platforms made from metal or wood, to sofas with high backs and arms. This style was continued in Byzantine times, often with an architectural emphasis in the design, but by the 12th century important beds were beginning to be furnished with testers and curtains, both for comfort and status.

The use of enclosures continued into the Middle Ages. In Northern Europe it became customary to use curtains and canopies supported in a variety of ways. In simple cases the curtains at the foot end would have been bundled up to give access to the bed as a day couch. In other examples the half tester often extended from the headboard over the bed. In Italy

Beds: Daniel Marot design for state bed with en suite portière, c.1690

it was common for the mattress to be laid on a low dais or floor with storage underneath, although the classical model of a mattress supported by two fulcra remained a type form until the 20th century. The four-poster bed was slowly developed from this type.

During the Renaissance the canopied four-poster bed remained popular, although there were beds with testers suspended from the ceiling, while some were fitted with a headboard instead. Until the mid-16th century fabrics had been important as decoration, and any woodwork was left rough and unfinished. After this time a taste for less fabric and more decorative exposed woodwork developed. Elaborately carved pillars and headboards reflect this change. The famous example of the Great Bed of Ware demonstrates the taste for detailed carving combined with inlaid panels at the headboard completed with a carved tester. Although often called four-poster beds, this name is not always an accurate description, as often the beds would be supported upon only two posts and a headboard.

In grand houses across Europe the state bed or *lit de parade* took an important position within the room, and it was usually the case that this bed was rarely slept in. Although the concept of state beds was ceremonial rather than functional, their designs were to have an influence on the style of ordinary beds.

It was often the case that the architect responsible for the house interior would also have created the design for the state bed. Daniel Marot was known for his extravagant designs for beds, and the example of the State Bed at Melville (now in the Victoria and Albert Museum) appears to derive from his ideas.

The latter part of the 17th century saw the development of an informal bed type which contrasted greatly with the state bed of the period. These fantasy beds, which seem to have been designed for intimate rooms, were highly decorated with amazing drapery, inset mirrors and papier-mâché decoration. The Trianon de Porcelaine in Versailles (c.1670) had two examples of these fantasies.

For other situations box beds remained popular, as they were often built into the fabric of the house. This was often a sensible solution in cottages and farmhouses, where draughts and cold were frequent and fabric was scarce. However, they were not found only in the poorer homes since panelled bedrooms in well-to-do Netherlandish homes were themselves often furnished with this built-in form.

During the 18th century it was often the practice for husband and wife to use separate bedrooms. It became customary for the lady of the house to hold court in a more sumptuous room than her husband's; he would often sleep in a less attractive room. This meant a return to models based on stately examples. Beds became extremely tall and exuberant, surmounted by testers with most of the woodwork covered with fabric.

Beds: French canopied bed, *lit à dome*, 19th century

Beds: bedroom with metal bedstead designed by Liberty, London, 1890s

The differences between French and English styles continued throughout the century. The French preferred a box-like finish and shape, while the English influence was towards a domed top, ornamental valances and hangings that altered the essentially square shape of the frame. In either case, though, beds were now hung with expensive fabrics, and were more the realm of the upholsterers' art than the carvers'.

Many of the pattern books of the 18th century illustrate a variety of beds. The British upholsterers Ince and Mayhew produced some extravagant suggestions for Rococo beds, while John Linnell drew sketches of state beds. Thomas Chippendale supplied beds in all the fashionable styles: Dumfries House has a Rococo-style bed; Nostell Priory boasts a Neo-Classical bedstead, while the 1762 edition of the *Director* included designs for Chinese-style bedsteads. Chippendale's work for Harewood House demonstrates the unified theme where the bedstead has en suite window cornices to match the bed frame. Robert Adam's executed designs include an astonishing concoction devised for the re-modelled Osterley Park. It was criticised by Horace Walpole as being

"too like a modern head-dress". In contrast, George Hepplewhite showed elegant bedsteads with restrained drapery combined with slender carved or reeded wooden posts. Altogether lighter in construction, the canopy itself was often pierced and carved. In another vein, Thomas Sheraton devised beds as various as a fascinating summer bed for a couple, and a design for a Grecian bed, complete with curtains and drapes.

Other bed designs continued the French taste for fabric dressing. These included the *lit à la polonoise* and the *lit à la turque*, often set into niches in panelled rooms, especially in France. The *lit à la polonoise* used curved iron supports which formed a fabric-covered dome and supports which could stand alone or be set into an alcove. The *lit à la duchesse* had a fabric tester attached at the back to the wall or ceiling which then extended the full length of the bed with no other support, whereas the earlier design called a *lit d'ange* used a flying tester or canopy which was smaller than the bed. The corona developed from this and has been a feature of bedrooms ever since. The French influence extended to *lits à l'anglaise* which had a three-sided level frame. This was designed for an alcove,

Beds: foam slab bed by George Nelson, 1950s

whereas the *lit de bateau* had just the two ends the same height.

The contemporary interest in mechanical furniture included beds, and a number of versions of hidden beds were devised. Some, like the one supplied to David Garrick's Hampton villa, had a mirror front and were painted to be en suite with cabinets. Others were less exotic and at their lowest level acted as folding beds for servants' rooms. Nevertheless many well-known makers produced this press bed form. The idea also developed into beds that were concealed as chests, library bookcases, and cabinets. A clear need for space-saving, as well as a taste for the metamorphic produced a whole range of folding beds, field beds and tent beds, many of which were ingeniously designed to be not only easily foldable but also portable.

During the 19th century, decorators and designers often looked to the past and introduced revivals of styles for interiors. Beds were no exception. In the early years of the century the influence of the Empire style continued to be felt through the works of designers such as Percier and Fontaine. During the 1820s there began to be a demand for Gothic designs, and in pattern books such as Nicholson's *Practical Cabinet Maker, Upholsterer and Complete Decorator* (1826), designs of four-poster beds are offered in both the Gothic and the Greek taste. The four-poster was giving way to the half-tester bed in a variety of designs. Some were Gothic with wooden frames and drapery, others were simply frames decorated with chintz dressings. Although generically called Arabian bedsteads, there were many variations. The famous Speaker's bed in the Palace of Westminster is an example.

During the 19th century demand for both hygiene and space-saving meant further developments in bed design. During the 1851 Exhibition, a number of iron bedsteads were displayed, some of which were fanciful reproductions while

others were simply functional. The use of iron and brass for bed frames encouraged an elegant simplicity that has been revived in the latter part of the 20th century. Although initially produced from black painted iron, by the 1870s the metal bed was made from brass-sheathed iron which, with brass accessories, meant a much more attractive finish was obtainable. The idea of a full, or even half-tester, had nearly disappeared and was often replaced with hinged side screens which had thin muslin draped over.

The notion of a bedroom suite became popular, with bed frames being designed to match wardrobes and dressing tables. In America and Europe the wooden bed was revived. It might be with a elaborate headboard in a choice of styles or it could reflect other developments such as the Belter shaping method. In many cases the head and footboards were connected by iron rails which supported a bed frame and spring mattress. This mattress was a great advance on the various fillings that had been previously available.

Although brass remained popular, the revival of wooden beds was encouraged in part by the Arts and Crafts movement in England and America. The efforts of design reformers such as William Morris as well as retailers like Liberty and Co., Heal's and others, meant that there was a place for the simple oak bedstead. This demand resulted from the desire to integrate beds into a unified scheme. If not of plain wood, they might be painted in simple colours. The examples designed by Carl Larsson in Sweden and Charles Rennie Mackintosh in Glasgow bear witness to this style. In some case the beds were art works in their own right. William Burges's painted bed or the products of the Omega workshops illustrate this trend.

In the 20th century beds followed changing fashions. Art Nouveau produced bedsteads with swirling carvings or pictorial inlays. Art Deco's exotic creations ranged from Eileen Gray's lacquered boat bed, to steel and glass beds. Contrary to

this display, the Modernists encouraged bed design in tubular metal utilitarian designs. Towards the end of this century the range of beds and bedsteads has increased widely to meet demands for stylistic variety. These have included frames of coloured aluminium, lacquer, plastic, metal, and wood, while electric beds, as well as water beds now have a place in the domestic bedroom. Changes in lifestyle have also meant that space-saving has once again become a consideration in bed-sits and flats so that the Japanese-inspired futon, the bunk bed, as well as convertible sofa-beds have found a ready market.

Bed-sits

The existence of "digs", small rooms for couples and single-occupancy tenancies, has been a feature of the British rental housing market since the late 19th century with studios and one-room flats proliferating in the first decades of the 20th century. In post-war Britain, however, it was the need for rented accommodation among the recently arriving influx of foreign immigrants and for the new "youth" market that

fuelled the classic phase of the growth of what has been termed "Bed-sitland". Although initially there were heavy concentrations of immigrants in Britain in the West Midlands and Bradford as well as a few other urban centres, almost a third of all immigrants arriving in the country after World War II settled in London. For such groups, unable to buy into the private housing market without capital, renting was the only option. Added to this, the renting of unfurnished accommodation lay beyond the pockets of the vast majority of immigrants.

Furnished accommodation in the form of single-room bed-sits tended to be centred in the inner city areas. In London's bed-sitland, the shared housing of digs and rooms was to become home to thousands of families. By using old, and now very often dilapidated housing stock, landlords also found that there were quick profits to be made from exploiting the very needy. A report in the *Kensington News* of 31 October 1958 commented on the Institute for Race Relations' Wickenden Report of the same year noting that, "during the period of a year nearly 70 companies were set up in North Kensington which let high-rented, over-crowded homes to coloured immigrants". Although attempts were made to curb the worst exploitative practices in London, by the London County Council for example, interviews conducted subsequently reveal that most tenants in rented rooms felt extremely insecure, the law allowing little or no protection against sudden eviction.

The psychological discomfort of bed-sit living for many immigrants and low-income tenants was matched by very poor physical standards of living. So flimsy was the re-structuring of earlier larger interiors that privacy was a particular problem. Furnished lets were not all subject to a regulated layout and the necessity of sharing cooking, washing and bathing facilities exacerbated the situation. Cheaply constructed partitions and poor facilities were matched, for the vast majority of tenants, by gloomy, drab decor. The cheapest wallpapers and linoleum were the best to be expected. Vagaries of tenancy rights meant that brightening up accommodation was either not permitted or simply not worth the effort with the result that many residents put up with whatever furniture and decorations the landlord had used. One interviewee remembers the standard West Kensington rented room as comprising a double bed, dressing table, Formica-topped table, two or three chairs, a wardrobe and a cot if you were lucky. Clothes were mainly kept in a suitcase and furniture was "second-hand and very shabby" (MacDonald and Porter, 1991).

In complete contrast to the furnished rooms inhabited by Britain's growing immigrant population was the bed-sitland of the 1950s and 1960s bachelor and single girl. Just as socio-economic trends in post-war Britain, and particularly the need for cheap labour, had encouraged immigration from abroad, so socio-economic patterns were associated with the rise in importance of the nation's youth population which, in turn, had a marked impact on housing patterns. A gradual reduction in family size in the years up to 1939, and the experiences of World War II (evacuation was especially significant), combined by the 1950s to give children greater freedom and to open up new possibilities. Post-war economic conditions provided many of the same children with new opportunities as young adults. Increased spending power created by the new technological high-wage society of the 1950s and 1960s produced a new group of young men and women whose affluence, for a

while at least, fed back into the system that had helped to create them.

Like Pop music and the new youth fashion industry, the trend towards bed-sit living for the middle classes grew out of a whole new youth culture and at the same time depended upon the spending power of the affluent teenager and young working person. Leaving home to live independently expressed a need for autonomy, freedom, and a move away from the confines of traditional family living. Yet, like music and fashion, the bed-sit phenomenon was quickly assimilated into the mainstream and became a topic of considerable interest within the commercial sector and was the subject of much “how-to-do-it” advice from writers within the design establishment and home-interest journals.

A somewhat prescriptive attitude to interior design had already been adopted by bodies like the Council of Industrial Design (CoID) in official exhibitions such as *Britain Can Make It* (1946), and the Festival of Britain of 1951. A few years later, magazine articles and books devoted to the subject of bed-sit living began to proliferate. Indeed, so popular was writing on single-room living for the more affluent young person that it is possible to trace the history of their decoration and furnishing through such material. For the “single woman’s bed-sit room in a block of flats” the CoID’s *Furnishing to Fit the Family* (1947) advocated “the skilful use of built-in cupboards in walnut panelling on either side of the fireplace”. Unit furniture also features very prominently and the CoID’s author has the imaginary occupant sensibly insisting on “as little free standing furniture as possible” as well as a “fresh, light” colour to maximise a spacious atmosphere.

The important distinction between these kinds of bed-sits and the more traditional one-room tenancies was the emphasis upon newness, smartness and modernity. In place of the hand-me-down furnishings and make-do arrangements of low-income rentals, there was a stress on neat, compact living provided by new fitted and unit furnishings, and bright, co-ordinated textiles and wallpapers. “One-room living for Sandy and Jane is well ordered; their furniture divides the room into neat areas for eating, sleeping, cooking” ran a feature in a 1959 *Woman* magazine article. And the 1976 book, *Living in One Room* continued this theme: “Living in one room is becoming by necessity, a way of life for more and more people. And if the prospect doesn’t inspire visions of comfort and space, the ideas in this book will. Open out the closet, get the sleeping space off the floor, have the storage disappear ... with foresight and planning you can keep pets, plants, even a roommate and still have an area for yourself”. The increasing associations of bed-sit living with fashionable, youthful, urban lifestyles also meant that its design and decoration were often linked to modern youth, or alternative styles. Pop furnishings, such as blow-up chairs, bean-bags and brightly coloured posters were popular items in the 1960s and early 1970s, while futons and sofa-beds have become the fashionable adjuncts of bed-sits in more recent years.

Behrens, Peter 1868–1940

German architect and designer

After a first career as an artist, Peter Behrens was initially a leading figure in the Art Nouveau and Arts and Crafts movements. His early paintings concentrated on landscape, but in the 1890s he depicted modern industrial scenes. A little later he painted more Symbolist subjects, and made a speciality of woodcuts; his large coloured woodcut, *The Kiss* (1898), has become one of the best-known images of the Art Nouveau style. Like many of his generation, Behrens was drawn into applied art through a varied series of commissions to design lettering, porcelain, glass, cutlery jewellery, furniture and even so-called “reformed” dress for women. Gradually his activity as a painter declined.

Behrens exhibited applied art in Darmstadt in 1899, and received an invitation to join The Seven, a community of artists who were brought together under the patronage of the Grand-Duke Ernest-Ludwig II of Hesse. The aim was to establish Darmstadt as the leading centre of artistic activity in the field of architecture and design in Germany. Behrens took a prominent part in the exhibition which opened there in 1901 and which included the houses on the Mathildenhöhe which were at once the residences of the seven artists, and exhibits in themselves of a modern way of living. He designed his own house, the only one of the colony not by the Viennese architect Joseph Maria Olbrich.

The success of the Darmstadt artists’ colony led to Behrens becoming Director of the School of Applied Arts in Düsseldorf in 1903, and he was given commissions to design a number of interiors for exhibitions – in Turin and Düsseldorf – and for important rooms in Hagen, as well as his second house, for Gustav Obenauer in Saarbrücken.

Following further major exhibition projects – for Dresden and Mannheim in 1906 – he was approached by the great electrical combine, the AEG, and engaged as artistic adviser on the design of arc lamps. Within a few years, however, Behrens’s activity for the firm expanded to include the design of an enormous range of their products, the brochures and the typography used throughout the combine, their large factories and even the associated housing estates. His Turbine Hall of 1909 has become one of Behrens’s best-known industrial works.

In his long and productive subsequent career, Behrens designed many houses, principally those in Hagen for Karl-Ernst Osthaus (1909–12), for Dr. Wiegand in Berlin (1911–12), for W. J. Bassett-Lowke in England (1923–25), and for Clara Gans in the Taunus mountains in 1931. He also

Behrens: dining room, Behrens house, Darmstadt, 1901

designed apartment blocks for Vienna City Council (1924–28), and for the Weissenhofsiedlung in Stuttgart (1926–27). His astonishingly prolific output included headquarters for the Mannesmann company Düsseldorf (1911–12), and for the Hoechst Dyeworks (1920–24), as well as the German Embassy in St. Petersburg (1912). His last project (1939) was a new AEG headquarters for Albert Speer's notorious and never realised *Nord-süd Achse* for Berlin.

Behrens's first house (1900–01) for himself, his wife, and their two children, has three principal rooms on the ground floor. A hall, from which the staircase rises, has wide sliding screens opening from it to a music room, which in turn is interconnected with the dining room through a broad arch. In this way, the whole of the ground floor might be opened up for musical evenings or parties. This open plan has been compared with that of Frank Lloyd Wright's first house at Oak Park, of the same period. The music room, said by Behrens to be the principal apartment of the house, was dark and intense, with armchairs, stools, and benches of black-stained birch, a gilded ceiling "like some old church dome", and blue mirror-glass on

the walls which were decorated with red and grey marble. The piers on either side of the entrance to the dining room were decorated with stylised figures like Egyptian goddesses, and the piano, in grey maple, bore the Egyptian motif of spread wings. The floor was lower than that of the adjoining rooms, and the ceiling higher.

In sharp contrast, the dining room had japanned white furniture and panelling, with silver and crystal electric chandeliers suspended from the white ceiling, which was moulded with rhythmically interlaced lines. The carpet and other accents were wine red. Other rooms in the house were also colour-coordinated; the bedroom for Mrs. Behrens was predominantly yellow, and that of Behrens had violet-japanned poplar furnishings.

The Hamburger Vestibühl for the Turin Exhibition of 1902 was a crypt-like interior influenced by the writings of Friedrich Nietzsche, whose book *Also Sprach Zarathustra* was displayed in the room. It was a huge rectangular space surrounded by a massive arcade, which had huge voussoirs and keystones. Cross-vaults supported a flat ceiling pierced with a large

rectangular opening, glazed with a yellow opalescent canopy. In the corners, by contrast, blue light filtered down from behind the arcade. Trailing plants hung down over a central, oblong, sunken pool with rounded ends, guarded by kneeling, winged figures in cement.

Following visits to Glasgow and Vienna, Behrens's style became lighter, more rectilinear and geometric, as in the interior of the restaurant Jungbrunnen for the 1904 Düsseldorf Exhibition. Here, and at the Oldenburg Exhibition buildings and at the Haus Obenauer (1905–06), "the admirable, cool spirit of the Greeks" was emulated. The interiors of the Concert Hall, and of the Delmenhorster Linoleumfabrik Pavilion at Dresden in 1906 developed this Neo-Classicism further, using spirals and other decorative motifs from Greek ceramics as flat surface wall patterns. In the sober, formal, sumptuous and rather heavy interiors of the Wiegand House in Dahlem (1911–12) for a client who was a classical archaeologist, this tendency was even more pronounced, with motifs such as a palmette derived from an Apulian painted amphora. The execution of the powerfully classical interiors of the German Embassy in St. Petersburg, also of 1911–12, were supervised by Ludwig Mies van der Rohe, acting as Behrens's site architect. "Under Behrens, I learned the grand form, if you see what I mean", Mies wrote later.

In his designs for the Mannesmann-Röhrenwerke in Düsseldorf (1911–12), Behrens took the practical step of working from the dimensions of an office desk and the space that it required. This unit and multiples of it was the basis for the construction of the entire building. An interior with furniture for working-class families was exhibited at the Trades Union Headquarters in Berlin in 1912.

In the 1920s, several of Behrens's interiors were Expressionist, the most commanding survivor being the hall of the Hoechst Dyeworks Headquarters (1920–24). Huge brick pillars, triangular in section, rise to support a roof lit by star-like skylights. The bricks are coloured, from the lightest and brightest yellow at the top, down through the spectrum to greens and blues at the bottom.

His Dombauhütte (a pavilion to exhibit religious art) at Munich of 1922 was attacked by the infant Nazi party for its violent polychromatic interior brickwork, Expressionist stained glass, and its tormented crucifix by Ludwig Gies. The Nazis succeeded in having it closed. The interior of the villa for Clara Gans in the Taunus (1931) was, by contrast, a major exercise in restrained, cubic Modernism, lavishly finished. The living room walls were lined with parchment, with a floor of dark ebonized bog-oak into which was laid a pattern of lines in white maple. The dining room walls and ceiling were panelled in rosewood, having a window to slide away to make the space continuous with the terrace.

Around the time of World War I, Behrens began writing and teaching on design and he became deeply involved with the Deutscher Werkbund. From 1922 to 1936 he taught architecture at the Vienna Academy and in 1936 he conducted architectural masterclasses at the Berlin Academy. His importance as a teacher and his work as an industrial designer have tended to overshadow his gifts as a designer of interiors and

furnishings, but in both of these spheres he proved remarkably versatile.

ALAN WINDSOR

Biography

Born in St. Georg, Hamburg, 14 April 1868. Studied painting at the Gewerbeschule, Hamburg, and at the Kunstschule, Karlsruhe; was a private pupil in the studios of Ferdinand Brütt, Düsseldorf and Hugo Kotschenreiter, Munich. Married Lilli Krämer, 1889 (died 1957). Active as a painter in Munich from 1890. Co-founder, Munich Secession, 1893; co-founder, Union of Arts and Crafts Workshops, Munich, 1897. Began designing furniture, porcelain and glass in the late 1890s. Joined the artists' colony, Darmstadt, with others including J. M. Olbrich, 1899. Commenced architectural work, 1900; in private practice, Berlin, from 1907. Founder-member of the Deutscher Werkbund, 1907. Employed as a designer and design consultant by electrical combine AEG, Berlin, from 1907. Director, Nuremberg Master Course, 1902; Director, Kunstgewerbeschule, Düsseldorf, 1903–07; Director, Academy of Art, Düsseldorf, 1921–22; Professor, Academy of Fine Arts, Vienna, 1922–36; Head of the Department of Architecture, Prussian Academy of Arts, Berlin, 1936–40. Exhibited at numerous national and international exhibitions including Turin 1902, St. Louis 1904, and Cologne Werkbund exhibition 1914. Pupil/assistants included Le Corbusier, Walter Gropius, and Mies van der Rohe. Published numerous books and articles on architecture and design. Died in Berlin, 27 February 1940.

Selected Works

Interiors

- 1900–01 Behrens House, Künstler-Kolonie, Darmstadt (building, interiors and furnishings)
- 1902 Exposition of Decorative Arts, Turin (exhibition display including vestibule, reception room and study)
- 1904 Building Exhibition, Düsseldorf (building, interiors and furnishings for the restaurant)
- 1904 City Library, Düsseldorf (decoration and furnishing of the Reading Room)
- 1905 Nordwestdeutsche Art Exhibition, Oldenburg (pavilions, showrooms and gardens)
- 1905–06 Gustav Obenauer House, Saarbrücken (building, interiors and furniture; remodelled the study/library 1910)
- 1906 Exhibition of Applied Arts, Dresden (buildings and interiors including a concert hall, vestibule and reception room, and the Delmenhorster Linoleumfabrik Pavilion)
- 1906–07 Klein carpet shop, Hagen (interiors)
- 1908–09 Schröder House, Eindhoven, near Hagen (building and interiors)
- 1909–10 AEG Turbine Factory, Huttenstrasse, Berlin (building and interiors)
- 1910 Cuno House, Eindhoven, near Hagen (building and interiors)
- 1911–12 German Embassy, St. Petersburg (building and interiors; supervised by Mies van der Rohe)
- 1911–12 Wiegand House, Dahlem, Berlin (building, interiors and furniture)
- 1911–12 Mannesmann Office Building, Düsseldorf (building, interiors and furniture)
- 1920–24 Hoechst Dyeworks, Frankfurt (building and interiors)
- 1922 Dombauhütte Craft Exhibition, Munich (pavilion and interiors)
- 1923–25 New Ways, Basset-Lowke house, Northampton (building and interiors)
- 1931 Clara Gans Villa, Kronberg, Taunus (building, interiors and furniture)

Behrens designed furniture, porcelain and glass from the late 1890s. He was employed by AEG to design lamps and other electrical appli-

ances from 1907 and ultimately advised on all aspects of their corporate identity including graphics and architecture.

Bélangier, François-Joseph 1744–1818

French architect and designer of gardens and interiors

François-Joseph Bélangier was one of the most innovative designers of his generation. Trained as an architect, he was an important exponent of the early Neo-Classical style and was also noted for his work in landscape design. But he is best known for his interiors, and particularly the interiors of the small pavilions and bath-houses that graced the parks and

gardens of his aristocratic and discriminating Parisian clientele. Many of these were designed in the newly-fashionable Etruscan manner, and Bélangier's skilful interpretations of this style, together with his championship of arabesque ornament and forms, exercised a strong influence on French interior decoration throughout the last quarter of the 18th century.

Bélangier was born in Paris, the son of a haberdasher, and was educated first at the Collège de Beauvais, studying physics under Abbé Nollet, and then at the Académie Royale d'Architecture where he studied architecture under Julien-David Leroy. He was a protégé of the influential collector and connoisseur, the Comte de Caylus, and he also spent time perfecting his draughtsmanship with the architect Pierre Constant d'Ivry. He is mentioned first in 1764 in the records of the Académie when he competed for one of the monthly prizes; in 1774 he applied unsuccessfully for membership. But his professional career had already begun in 1767 when he was appointed draughtsman to the Menus-Plaisirs du Roi. He designed a jewel cabinet for Marie Antoinette in 1769 that has been described as the first monument of the refined late 18th-century Neo-Classical style in furniture.

In the same year he met Sophie d'Arnould, the *prima donna* of the Paris Opéra. This was an important meeting for not only did Sophie d'Arnould become Bélangier's mistress but she was also well-placed to introduce him to a number of wealthy clients. These included the Prince de Ligne, for whom Bélangier worked on designs for the gardens of the Château de Beloeil in Belgium, and the Comte de Lauragais for whom he built a bath-house in the garden of his Paris house, the Hôtel de Brancas, c.1770. The bath-house was an unusual and well-publicized commission. Baths and bathing had become more common among the French aristocracy earlier in the century but Bélangier's bath-house represented a new building-type, resembling a free-standing temple or small-scale replica of the public baths of ancient Rome. It was embellished with four free-standing columns, recalling, according to Bélangier, one of the temples of Praeneste or one of those "which Palladio described and which existed at Pola in Istria". The interiors were extremely influential and included decorations by the sculptor Nicolas-François Lhuillier that recreated, amidst the grand columned interior, something of the style of the more intimate grotesque decorations, *à l'antique*, that Raphael and Giovanni da Udine had used in their work at the Vatican and other Roman palaces. This style of decoration, known as the arabesque, or Etruscan style, became so popular in Paris later in the century that even wallpapers, produced by firms such as J.-B. Réveillon, featured reproductions of arabesque and grotesque motifs.

The Comte de Lauragais was also a frequent visitor to England; he had his own stables at Newmarket and became a pioneer of the English garden in France. Bélangier went to England at least once – a notebook shows various sketches of English sites and in 1778 he designed a scheme for the gallery at Lansdowne House in London – and he too was interested in English landscape design. Indeed, although he was not the first French designer to plan gardens in the English style, his work at Beloeil, Bagatelle, Neuilly and Méréville did much to encourage the more widespread acceptance of this style of garden in France.

Bélangier also worked much for another Anglophile, the

Bélangier: Mademoiselle Dervieux's bathroom, Paris, c.1789 (Bibliothèque Nationale, Paris)

Comte d'Artois, who was the youngest brother of Louis XVI and for whom he designed the Château and park of Bagatelle in the Bois de Boulogne (1777). This commission included a small building, known as the Bagatelle, which was constructed in 64 days to win a bet and which became as famous as the Comte de Lauragais's bath-house. The scale of the building, as though befitting so precious a project, was kept small and deliberately underplayed its owner's rank. The main bedroom was conceived of as a tent, containing numerous military emblems including a cannon raised on its end to support the chimneypiece and heaps of cannon balls and grenades to fuel the stoves. Like the bath-house at the Hôtel de Brancas (1770), the walls of the Bagatelle featured elaborate arabesques and Bélangier was assisted in the execution of this work by his brother-in-law, Jean-Démosthène Dugourc, who painted the figurative elements and who went on to use this style of decoration in numerous subsequent decorative schemes.

Access to the Bagatelle was along a winding road, designed by a Scottish landscape architect, Thomas Blaikie, who was to remain busy at the site until the Revolution. Yet, if this was intended as an English garden, the result was distinctively French including numerous contrivances such as a grotto with a Gothic kiosk, a stone bridge with a pagoda, a Japanese bridge, and another pagoda which, like the bedroom of the house, was made in the form of a tent.

Nearby, Bélangier designed another garden complex – for the financier Claude Baudard de St.-James – which included a small brick house and several pavilions, kiosks and swings. The most celebrated of the garden features was the “Grand Roche”, a massive rock carved to accommodate a bathroom, reservoir, grotto and gallery, and which was described as the “Eighth Wonder of the World”. Claude Baudard de St.-James had previously engaged Bélangier to design the grand salon of his hôtel in the Place Vendôme. This interior still survives and includes elegant gilt and white panelling incorporating Corinthian pilasters, gilt trophies and garlands of flowers, and overdoors painted with mythological scenes by Jean-Jacques Lagrenée.

Bélangier was also responsible for the design and decoration of several other Parisian hôtels during this period, notably that of the hôtel on the rue des Capucins de la Chaussée-d'Antin (1787) which is asymmetrical in plan and whose elevation is decorated with free and scattered ornaments of a very mixed style. His most celebrated interiors, however, were created for another of his mistresses, the dancer Mlle. Dervieux, whom he subsequently married. In 1789 Bélangier added onto her house a dining room and a small wing containing a bathroom and boudoir. A coloured engraving of c.1790 shows the bathroom, with its sunken central pool and niches decorated with painted bas-reliefs, and a view through to the boudoir which contains

a superb circular Beauvais carpet, furniture made by the Jacob firm, and an apsed alcove with a draped ottoman fitted into three sides. Like the interiors at the Château de Bagatelle, this pavilion was a refined and original exercise in the *Goût Etrusque* and featured liberal use of grotesque ornament. Its voluptuous setting formed the perfect backdrop for Mlle. Dervieux's celebrated soirées and complemented the personality of a client whose taste clearly ran to the theatrical and exotic: according to contemporary accounts, her bedroom was apparently hung with "elaborate banners covering the walls in the Arabian Manner".

During the Revolution Bélanger's fortunes were mixed. In 1787 he was elected to the States-General for the district of St.-Joseph but later he was imprisoned on suspicion of having helped some of the émigrés. In 1796 he joined the staff of the newly-formed Monuments Public but he did little work for this body. The two major works at the end of his career, both started in 1808, were quite different from his earlier commissions; one was a slaughterhouse, built at Rochechouart, known in Bélanger's drawings, the other was the dome of the Halle au Blé, executed in a combination of glass and iron. Bélanger had learned of the use of iron in England where he observed "it serves them in the absence of stone". But, at the Halle au Blé, glass was also used for the first time, and, if the use of iron was widely criticised, Bélanger himself was sufficiently proud of what he had done to write to Jacques-Louis David that this represented "a new conception for the first time".

Bélanger was dismissed from his post at the Monuments Public after writing an anonymous pamphlet attacking the administration of public buildings under Jarente de la Bruyère. However, after the restoration of the Bourbon monarchy he was back in favour, organising many public decorations including those for the entry of Louis XVIII into Paris in 1814, and was admitted to the Légion d'Honneur in 1815. He died in 1818 and was buried in the cemetery of Père Lachaise in Paris. His epitaph was appropriately grand and claimed that he was "superior to Kent in the gardens of Méréville / worthy follower of Michelangelo in the cupola of the Halle au Blé".

Biography

Born in Paris, 12 April 1744. Studied physics at the Collège de Beauvais under Abbé Nollet, and architecture at the Académie Royale d'Architecture under Julien-David Leroy and Pierre Constant D'Ivry, 1764–65. Married Mlle. Dervieux. Brother-in-law and pupil was the designer Jean Démosthène Dugourc (1749–1825). Visited England, 1766, where he probably met William Chambers (1723–96). Appointed dessinateur, Menus-Plaisirs du Roi, Versailles, 1767, inspecteur, 1777; premier architect to Comte d'Artois, 1777. Elected to the States General, district of St. Joseph, Paris, 1787; subsequently imprisoned as a royalist, 1794; named Commissaire de la Commune, 1795 and Architecte du Conservatoire, 1796. Organised several public decorations during the restoration, including that of the entry of Louis XVIII into Paris, 1814. Légion d'Honneur, 1815. Died in Paris, 5 January 1818; buried in the cemetery of Père-Lachaise.

Selected Works

An important collection of Bélanger's drawings and designs for his work at the Hôtel de Bagatelle are in the Archives Nationales, Paris.

Additional manuscript material is in the Bibliothèque d'Art et d'Architecture, University of Paris. A list of his architectural commissions appears Gallet 1972.

Interiors

- 1770 Hôtel de Brancas, Paris (bath-house): Comte de Lauragais
- 1777 Hôtel de Bagatelle, Bois de Boulogne, Paris (building and interiors): Charles Philippe, Comte d'Artois
- 1777–79 Château de Maison, Neuilly-sur-Seine (remodelling and interiors, including summer dining room and gaming room): Charles Philippe, Comte d'Artois
- c.1777 Hôtel de Mazarin, Paris (decoration including furniture and carpets): Duchesse de Mazarin
- c.1780 Folie St. James and Garden, Neuilly-sur-Seine (house and park including the "Grand Roche" grotto and interiors): Claude Baudard de St.-James
- c.1787 Château de Méréville (interiors including the hall, dining room, small saloon, billiard room, winter and summer salons; and gardens): Jean-Joseph de Laborde
- c.1789 Hôtel Dervieux, Paris (additions and interiors including a dining room, bathroom and boudoir): Mlle. Dervieux
- 1808–13 Bélanger House, Santeny (building, interiors and gardens)
- 1808–13 Halle au Blé, Paris (dome)

Belter, John Henry 1804-1863

American cabinet-maker and furniture manufacturer

John Henry Belter is considered to have been the foremost American cabinet-maker who worked in the Rococo Revival style. The combination of his innovative construction techniques and artistic genius resulted in forms that mark the crowning expression of the style.

Belter was born in 1804 near Osnabrück, Germany. Presumably he had already been well-trained as a cabinet-maker when he emigrated to New York City in 1833. His initial employers are unknown, but by 1844 his business on Chatham Street was listed in the New York City directories. Two years later, the shop moved to fashionable Broadway. A growing business resulted in store relocations further uptown, always on Broadway. By 1854 Belter also had a large factory on the Upper East Side. After his death in 1863, the business was continued by the remaining partners, brothers-in-law John, William, and Frederick Springmeyer, until bankruptcy closed it in 1867. Regrettably, the firm's records have never been discovered.

While it is likely that Belter worked in the Biedermeier, Grecian, and, perhaps, Gothic Revival styles in the early years of his career, his documented post-1845 American oeuvre is devoted solely to the Rococo Revival style. This revival originated in England in the 1820s, quickly moved to France, and appeared in Germany in the 1830s. Belter was obviously attuned to international trends and, with this foundation, created an individual style characterized by bold silhouettes and lush naturalistic ornament. In general, Belter modeled his forms after 18th-century Rococo furniture, but his adaptations reached new heights in furniture ornamentation.

Belter was not only an artist; he was a true designer who strove to create works of art that were striking, structurally sound, comparatively lightweight, and unusually durable. In appearance, these objects range from simple to complex, delicate to massive. Belter used traditional joinery techniques with solid and laminated wood to construct his wares. He called his furniture "pressed work," referring to the lamination process. It is the use of this bonded layering in combination with contoured shaping, intricate pierced decoration, and three-dimensional carving that characterizes Belter's work. He was not the first cabinet-maker to employ the lamination process, but he is credited with perfecting the technique and using it to achieve artistic distinction.

Belter was awarded four patents by the United States government. Although some of the methods described in the patents seem to have been used for years before gaining official recognition, the patents document Belter's manufacturing techniques and chronicle his career. The first patent, recorded in 1847, was for "Machinery for Sawing Arabesque Chairs." It described the equipment for holding a laminated chair or sofa back while a special saw cut out a design. His 1856 patent was for an easily assembled three- to five-piece laminated bed frame. Belter's third patent, "Improvement in the Method of Manufacturing Furniture," was approved in February 1858. While it fully described his lamination process, this patent specifically registered chair backs that curved in two planes.

His final patent (1860) addressed the construction of a laminated bureau drawer and an unusual locking device.

Belter used thin layers of wood – as few as four, as many as 21, but often around ten – glued together with the grain of each layer at a right angle to the adjoining layer. Inner wood layers were less expensive varieties such as hickory, walnut, ash, and oak, whereas the outer layers were of rosewood, mahogany, or oak. These "sandwiches" were shaped and pressed in cylindrical cauls. Curved segments, including chair-backs, were cut from the formed wood. The laminated pieces, which were strong yet lightweight, were then yet able to be pierced and carved. To supply the essential depth for other ornamental carving, additional pieces of solid wood were employed. The completed ornamentation was realistic in appearance and encyclopedic in a variety that included flowers, fruit, vegetables, foliage, shells, birds, animals, putti, and figural busts. The backs of Belter's chairs were also carefully designed. The back and the rear legs fit flush into the seat rail and thereby display a beautifully veneered surface on a bold, curving silhouette.

Many of the same designs were used throughout Belter's relatively brief American career – including at least 75 distinct patterns within the typical armchair / side chair / sofa forms – but the scarcity of surviving labeled examples makes precise dating difficult. Few period records exist with appellative designations for the various Belter patterns, but names have been assigned using major collections as sources. These names reflect visual characteristics, original owners, object locales, or combinations thereof. For example, the *Rosalie* pattern is named for a house in Natchez, Mississippi, for which an *in situ* parlor suite was acquired in the late 1850s. Lacking openwork – but having carved flowers, foliage, and fruit (including grapes) – this originally may have been the "Grape Pattern" referred to on a rare Belter bill of sale to another client. "Arabasket," a similarly discovered Belter-coined term, could refer to a specific openwork pattern of scrolls, flowers, foliage, and fruit; a group of related patterns, or all patterns with openwork.

The influential American author Andrew Jackson Downing wrote in 1850 that "Modern French furniture" (Rococo Revival) was most appropriate for parlors and boudoirs. His comments coincide with the emerging trend of purchasing household furnishings en suite, and Belter made a specialty of matched parlor groups that included sofas and chairs of the same pattern, with complementary tables and étagères. As "Manufacturers of All Kinds of Fine Furniture" (according to a surviving label), J.H. Belter & Company also supplied objects for the dining room, the library, and the bedroom – mantels, mirror frames, and window cornices could be commissioned. Belter's showrooms gave clients a taste of his wares, but most of his sales were custom-orders, with the options of "extra carving," special wood finishes, protective fabric covers, and, if needed, packing crates. Belter's amazing design variety, albeit within the Rococo Revival *milieu*, appealed to a prosperous national clientele, principally from the Northeastern states, but occasionally from the South and Midwest. A handsome nine-piece group, without openwork, sold for about \$700; more elaborately ornamented counterparts were priced upwards from \$1100.

Several other cabinet-makers in New York City and

Philadelphia produced laminated Rococo Revival furniture. Comparative studies have clearly defined Belter's characteristics from those of his competitors. Amidst a challenging idiom, the works of the latter range from good to excellent, but Belter's designs are more exciting, his construction techniques are superior, his layers of lamination are thinner, and more numerous, and his carving is richer and more finely executed. Belter's expressive ornamentation, achieved through a judicious balance of machine technology and skilful, free-hand carving, exhibits a mastery of process that elevated the standards of craftsmanship for cabinet-makers working in the Rococo style.

Biography

Born Johann Heinrich Belter in Hilter, near Osnabrück (then Kingdom of Hanover), Germany, 1804. Trained as a cabinet-maker in Germany; emigrated to America, 1833. Established his own business and listed as John H. Belter, cabinet-maker, Chatham Street, New York, 1844. Listed as John H. Belter, manufacturer, 547 Broadway, 1852; opened a factory at 3rd Avenue and 76th Street, New York, 1854. Awarded 4 patents relating to the manufacture of furniture, 1847–60. Died in New York, 1863; the business remained in operation until 1867.

Selected Collections

Important examples of Belter's furniture are in the Metropolitan Museum of Art, the Brooklyn Museum and the Museum of the City of New York, all New York City; the Strong Museum, Rochester, New York; the Winterthur Museum, Delaware; and the Victoria and Albert Museum, London. A large group of furniture is also on view at Sewell House, Odessa, Delaware.

Further Reading

A comprehensive account of Belter's career and the firm's manufacturing processes appears in Schwartz 1980 which also contains a bibliography of primary and secondary sources. For more recent research see Douglas 1990.

Bennett, Ward 1917–

American sculptor, and furniture, interior and textile designer

Ward Bennett, born in New York, studied sculpture in the late 1930s in Paris with Constantin Brancusi, and painting in New York with Hans Hofmann in the early 1940s. In the later years of that decade he was apprenticed to and befriended by Le Corbusier. All of these experiences, along with a short stint as a fashion designer, were formative in the development of his work in the areas for which he is best known – interior design and product design. His training with such masters of control in modern art, architecture and design as Brancusi and Le Corbusier have given Bennett's work the rationality that has caused him to be identified as a practitioner of "reductivist Modernism" (Stern, 1995).

About 1947 Bennett received his first interior design commission, from a family member. The apartment interior was published in the *New York Times*. Within a short time Bennett had opened his first interior design practice in New York. In the ensuing years he developed his distinctive vocabulary, which he describes as "intuitive, intellectual, and cultural" (Brown, 1980). His artistic training has aided in the development of his reflective, minimalist style which often features well-chosen art and antique objects for his clients.

In 1960 Bennett made a splash with his conception of interiors for the recently completed Chase Manhattan Bank building in New York (Skidmore, Owings & Merrill), now regarded as a milestone for office spaces in the modern corporate era. Many of the floors were open-plan and enjoyed a freedom of space characteristic of the post-war modern period. Bennett's interiors for the executive offices were designed to take advantage of the larger spaces created on one side of the building through the off-center placement of the elevators. Most notable was the suite for David Rockefeller, the bank's president, which incorporated paintings and other works of art, furniture (some designed by Bennett) similar to the corporate-friendly style of Florence Knoll, and thoughtfully-chosen accessories. Bennett's connection with the art world compelled him to assist the bank in its development of a corporate art collection, a popular activity today but at that time a very radical investment. (The Chase Manhattan was also assisted in this endeavor by curator and later Museum of Modern Art director, Alfred H. Barr, Jr.)

After 1960, Bennett became heavily involved in furniture design, though innovative features of his interior settings, such as the conversation pit, were influential during that decade and the next. By 1970, the strain of his design commitments led to health problems, and Bennett became more selective in the commissions he accepted. In the 1970s and 1980s, Bennett was described as "the mentor of, and inspiration to, designers working in the industrial style," also known as the High-Tech movement, in interior design (Kron and Slesin, 1978). This style was marked by the use of prefabricated materials and

industrial fittings and objects in residential interiors. His Long Island summer home was his unofficial test-ground for unique uses for industrial supplies, such as incandescent light reflectors (used extensively in factories and warehouses) for home illumination, subway gratings to cover air ducts, and hospital fixtures in the kitchen and bath.

Following a Modernist credo, Bennett proclaims that "I keep interesting and good architecture. But if it's not interesting, I'm apt to destroy it to see if I can make it better." This can be seen in two simple but striking interiors he created for himself from the attics of Paris and New York apartment buildings. In his Paris home and studio, he gutted the former servants' quarters, created a white background with new walls and ceiling, and covered them with a linen / cotton fabric used for butchers' smocks. Other neutral elements such as a sisal floor covering provide a backdrop for his carefully chosen decorative and functional objects; he chose masculine objects for himself, such as leather-covered sofas, in strongly contrasting red and black color schemes, set into niches. His New York home and studio are at the Dakota, where he created a stepped space in the small interior to accommodate new plumbing. Black slate tiles and a red carpet continue his Paris color theme, as do neutral walls, black leather furnishings, and innovative, adjustable lighting – in the Paris apartment he used Le Corbusier's swivel lamps on walls and on furniture; at the Dakota he turned the photographic lighting equipment known as barn-doors into movable wall shades (another High-Tech detail). The decoration of his New York apartment at the Dakota, first completed in 1960, has been called his masterwork (Stern, 1995). He took the two pyramidal spaces atop the building and created a duplex, puncturing one wall with a two-story window that gives a diagonal view of Central Park. He colored the walls and floors with characteristic neutrals, which allowed for his art collection to mingle with Bennett-designed furniture, antiques, modern classics, and High-Tech selections.

Bennett's interiors over the past three decades, for the most part residential commissions in the United States and Europe, continue to be exercises in simplicity. He frowns on the collective work of his industry: "You should walk into a place and feel its ambience, not see that it has been done by some decorator in pastel this or lace that. I strongly disagree with, and disapprove of, most people who are doing interiors today. They are part of a big and fashionable industry – selling rugs and towels, color combinations, and pewter and bamboo. That's not for me." He still punctuates his interiors with strategically-chosen examples of modern lighting and furnishings, including pieces designed by Le Corbusier, Charles Eames, and by Bennett himself.

Bennett is well-known today for his numerous designs for home furnishings: he designed china, glassware, and furniture for Tiffany in 1963 and 1971, and flatware for Supreme (now Tole); he was commissioned by Bloomingdale's in 1986 to design flatware, tableware, and glassware for production by Sasaki; he has produced many designs for the furniture makers Brickel, Neocon, and Geiger International; and he has also produced jewelry and textile designs. All of Bennett's product designs, as do his interior designs, reveal his association with early Modernists, and share a rational, functional quality. Bennett was honored in 1985 with an award from the

American Institute of Architects for his long and successful career in the design professions.

JENNIFER A. KOMAR

Biography

Born Howard Bennett Amsterdam in New York City, 17 November 1917. Studied sculpture at the Porto Romano School of Art, Florence, 1937; Académie de la Grande Chaumière and with Constantin Brancusi, Paris, 1937–38; and painting with Hans Hofmann, New York, 1943. Served in the United States Army, 1940–43. Apprentice in the studio of the architect Le Corbusier, Paris, 1947–50. Worked in the fashion industry as a designer, sketch artist and window dresser, in Paris and New York, 1930–45; freelance jewellery designer, Mexico, 1945–46. Active as an interior designer in New York and Europe, from 1947; independent designer, New York, from 1950. Numerous designs for furniture post-1960. Visiting professor, Yale University, New Haven, Connecticut, 1962–63; instructor, 1969–71, and associate professor from 1971, Pratt Institute, Brooklyn. American Institute of Architects Award, 1985.

Selected Works

Archive material, and furniture by Bennett are in the Cooper-Hewitt Museum, New York. Additional examples of furniture are in the Museum of Modern Art, New York.

Interiors

- 1947 Penthouse apartment, New York (interiors): Harry Jason
- 1960 Chase Manhattan Bank, New York (office interiors; building by Skidmore, Owings & Merrill)
- 1962 Rubin apartment, Park Avenue, New York (interiors and refurbishment, with Earl Pope)
- 1964 Penthouse apartment, The Dakota, 1 West 72nd Street, New York (remodelling of interiors, decoration and interior design): Ward Bennett
- 1960s Apartment, Paris (interiors): Ward Bennett

Bennett created more than 100 designs for furniture for Brickel Associates; his most well-known works include the 1148/58 *Mobius* range (1970), the *University Chair* for the L.B. Johnson Library, University of Texas (1971), and the *University 1550 chair* (1979). He also produced a 22-piece furniture collection produced by Geiger International in 1990. His cutlery designs include the *Metro* (1977–78), the *Trylon* (1980), and the *Helix* (1981) ranges, all for Supreme Cutlery. Bennett also designed several furnishing fabrics for Brickel Associates from the mid-1970s.

Bentwood Furniture

The use of bent wood for interior architecture has a long tradition. In England, J. Cumberland obtained, in 1720, the first patent, followed in 1768 by H. Jackson, and by J. Vidler, in 1794. In the United States in 1808, Samuel Gragg received his patent for the *Elastic Chair* in which the front legs, seat and back were stress-bent from a single piece of wood. In 1826, the Englishman Isaac Sargent succeeded in bending balustrade railings and window mullions with the aid of hot steam. Soon after, German-born John Henry Belter was investigating the steam-bending process in New York City. However, the most important contribution to the development of wood bending technology, its industrialization and its application in architecture was made by Michael Thonet (1796–1871).

In 1819 Thonet opened his first cabinet-making workshop

in his birthplace, Boppard-am-Rhein, where the forests of the Rhine valley provided him with a good source of raw material. He began experimenting with the process of lamination of thin layers of wood, sliced along the wood fibers, cooked in glue and bent into shape. Thonet used this technique for the curved frames of his first chairs, assembled from continuous glued pieces and made in the Biedermeier style of the early 19th century. In comparison with other furniture-makers who used massive pieces of pre-cut wood, shaped, joined and glued, Thonet's method was more efficient, faster and cheaper.

To protect his innovative furniture-making methods, in 1840 Thonet applied in Prussia for a patent – an application which was rejected for the reason that it lacked innovation. A year later, however, in 1841, his patent application was accepted in Paris, and Thonet took part in the 1851 Great Exhibition at London's Crystal Palace, where he won a bronze medal for "innovation, originality and elegance of form".

The move of the Thonet company to Vienna, capital of the Austro-Hungarian empire was influenced by the receipt of commissions for the interiors of the palaces of Prince Liechtenstein and Baron Schwarzenberg. In 1853 Michael Thonet transferred the company ownership to his five sons, renaming it Gebrüder Thonet and moving it to the Mollard Mill in Vienna. After the installation of the first steam

Bentwood chairs and tables designed by Thonet, and shown at the 1851 Great Exhibition, London

machines to produce bentwood, the company employed 70 people.

In its material and structural continuity, and its simplicity, Gebrüder Thonet's steam bent laminated chair heralded the evolution of the modern chair. The Side Chair, *Model No. 14*, of 1857, made from moulded laminated wood and solid beechwood, with a wooden seat, anticipated the Modern Movement in its minimal use of materials, lightness of weight, and suitability for mass production, a phenomenon which began to penetrate commercial and domestic interiors.

The demand for furniture ensured Gebrüder Thonet's growth. The company's 1859 catalog lists 25 items for sale; in 1873 this had risen to 110, and by 1911 to 1,400. Bentwood products included coat hangers, sheet music stands, children's furniture, baby cribs, kneelers, barber chairs, rockers, tennis racquets, and sleds. The consumer chair, *Model No. 14*, consisting of only six individual pieces, had been developed and manufactured in the company's first factory which opened in Koryčany, in 1857. Other factories followed, also in Moravia because of the abundance in the area of quality woods. Between 1859 and 1914, 40 million *Model No. 14* chairs were produced, with Thonet employment growing to 25,000 workers in some 60 factories throughout Europe. A factory-line production system separated the stages of the manufacturing process, well in advance of the introduction of the Ford assembly line.

In 1898 the architect Adolf Loos designed a bentwood chair with a stained beechwood frame and woven cane seat. Based on Thonet's *Model No. 14* chair, Loos's chair, designed for Vienna's Café Museum, represented the first of the architect-designed bentwood products. The chair was manufactured by Jacob & Josef Kohn of Vienna. Due to its streamlined and functional appearance, the Café Museum was subsequently nicknamed "Café Nihilismus" by patrons. Loos expounded his theories in the essay "Ornament and Crime".

The interiors of Vienna's seminal Modernist building, the Postal Savings Bank (1904–06), were the result of collaboration between the architect Otto Wagner and his pupil Marcel Kammerer. The furnishings included a bentwood chair with square-profile frame, black lacquered finish, and metal feet; this chair, the *Model No. 6516*, was manufactured by the Gebrüder Thonet. Architect Josef Hoffmann designed two bentwood side chairs with plywood seats, one of which was made for his Sanatorium in Purkersdorf (1904); the other was exhibited at the Viennese Kunstschau, in 1908. It was, however, the *Sitzmaschine* (the machine for sitting), designed by Hoffmann in 1905, which stole the 1908 Kunstschau show. Like the two side chairs manufactured by Jacob & Josef Kohn of Vienna, it was made of stained, laminated wood, bent solid beechwood and turned wood with brass fittings; it also featured an adjustable back. Stringently geometric and based on machine aesthetics, Hoffmann's *Sitzmaschine* anticipates the *Red and Blue Chair* designed in 1917 by Gerrit Rietveld.

In his interiors Le Corbusier frequently used the *Wiener Stuhl* (Viennese Chair) developed by Gebrüder Thonet in 1904, with black lacquered bentwood frame and natural cane seat. Le Corbusier included this chair in his furnishings for the 1927 Weissenhof Housing Exhibition in Stuttgart.

The Finnish architect Alvar Aalto was, throughout his career, fascinated by wood, its structural as well as its aesthetic

qualities. Aalto's exposed structural / architectural trusses, ceilings, lamps and chairs, evoke an age of architecture before the use of synthetics and plastics. His *Model 60* three-legged chair, with laminated bentwood birch frame and circular seat, designed in 1930, ostensibly rivalled in popularity Thonet's *Model No. 14* chair. The *Paimio Chair*, *Model No. 41*, from 1931, was designed for Aalto's Paimio Sanatorium, begun in 1929. The armchair has a bent, laminated birch frame and painted bent plywood seat. The design is revolutionary in the way greater pliancy is achieved by removing several layers of plywood veneer in the scrolls of the back and seat.

From 1945–46 the architect-designers Charles and Ray Eames contributed to the development of bentwood furniture with several innovative designs, including moulded plywood chairs, the *LCM* (Lounge Chair Metal) and the *LCW* (Lounge Chair Wood). The first had an animal-hide-covered moulded plywood seat and back, attached with rubber shock mounts to a chrome-plated bent tubular steel frame; the second, a stained moulded plywood seat and back attached with rubber shock mounts to bent plywood feet and back support. The *Lounge Chair and Footstool*, *Model Nos. 670 and 671*, conceived in 1956–57, were the Eameses' design for the luxury end of the market, with moulded plywood seat shells in rosewood veneer, leather covered foam- and down-filled cushions, on a swiveling cast aluminum base. Of generous proportions and of high quality materials, the *Lounge Chair* projects a sense of executive power. The Eameses' designs have been manufactured and marketed by the Herman Miller Company.

Since 1990 the Californian architect Frank Gehry has been developing a line of bentwood furniture characterized by the *Powerplay Chair*, made from bent and woven laminated wood. While he acknowledges the contribution of Thonet, Aalto and the Eameses in their innovative use of bentwood, Gehry wants to take it further by integrating the supporting and the supported (structure and seat) by forming it of the same lightweight interwoven wood strips in a basket-like pattern, thus giving the chair an extraordinary strength. Gehry's furniture is manufactured by the Knoll Group.

Berain, Jean I 1640–1711

French designer and *ornemaniste*

A designer of ornament, decorations, architectural fittings, furnishings, metalwork, tapestries and textiles, Jean I Berain was instrumental in the development of a new, less illustrative and more strictly decorative French Court style. Working in the latter years of the reign of Louis XIV, Berain's approach combined fantasy and exoticism with a tendency towards lighter, painted interior designs, and his work signified a move away from the grandiose and heavy Baroque style that had reached its zenith in the work carried out during the 1660s and after at Versailles. Employed as designer and draughtsman to the king ("Dessinateur de la Chambre et du Cabinet du Roi") from 1674, he was entrusted with the task of developing models from which other artists and craftsmen worked. These models included not only the decorations and costumes for all the royal ceremonies and entertainments but also designs for the interiors and furnishings of the royal palaces. The execution of these royal interiors did much to establish Berain's reputation among his contemporaries but, unfortunately, few have survived, and today he is remembered chiefly for the development of a new style of grotesque ornament that was influential in many parts of Europe and for his role in the evolution from Baroque to Rococo styles of design.

According to the Swedish royal architect, Nicodemus Tessin the younger, Berain was responsible for the design of the decorations of the Cabinet des Curiosité (c.1682) which housed Louis XIV's collection of antiques, jewels and cameos. The Cabinet was entered from the Salon de l'Abondance. The corners were embellished with pyramidal arrangements of ornate gilded shelves surmounted by putti carrying oval medallions adorned with painted or sculptural representations of Abundance, Magnificence, Symmetry, Cupid and Venus on a gilded background. The ceiling was in the form of a great dome, painted blue and decorated with golden flowers. In Tessin's opinion, the most striking feature was the use of mirrors on the walls and ceiling which reflected light from the windows, one of which was oval (*oeil de boeuf*). Berain also designed a sumptuous bureau for the room (untraced). Sadly, this spectacular interior was destroyed in the 18th century and only a drawing, which gives no decorative detail, survives.

Berain's work for the Dauphin's Cabinet de Monseigneur (1699) in the Château de Meudon has also been destroyed, and a degree of confusion surrounds this commission. According to the art historian Fiske Kimball this interior is represented in the painting by an unknown artist of *Le Grand Dauphin dans son cabinet* which is now in the collection at Versailles. Kimball's attribution, made in the 1940s, was based on the fact that the fireplace, the arabesque panel to its right and the bureau all appear to derive directly from Berain's engraved designs, thus establishing Berain as the author of the decoration as a whole. This view has been questioned by subsequent scholars but the similarities between these elements and Berain's models are undeniable, and while the precise identification of the room and its occupants may still remain a mystery, the painting is nevertheless a useful illustration of a Berainesque interior.

One of the few interior schemes designed by Berain to survive *in situ* can be seen in the Hôtel de Mailly, Paris, which

Berain: engraving, late 17th century

was executed by André Camot in 1687–88. A ceiling remains in the *chambre du lit* (also known as the *salon doré*) but the original wall and door panels were transferred to the Château de la Borde at Vernou-en-Sologne before World War I and reproductions are now in place. The decoration of the panelling is similar to the grotesques realised by Charles Le Brun at Vaux-le-Vicomte, but it does not have the suppleness and animation of other Berain designs. The ceiling is more original and is treated as a single surface. The arabesque structure of bandwork and acanthus is decorated with vines, masks, putti, "galant" motifs in medallions and portraits of Louis de Mailly and his wife surrounded by palms and laurels topped by the Marquis' crown. The decoration highlights the successful collaboration of designer and craftsman. Camot's experience in the execution of theatre and festival designs and his particular skill in imitating gilt-bronze is evident in the shimmering effect of the gold in the ceiling which, subtly highlighted in shades of brown, gives an astonishing sense of relief, so that the ceiling as a whole appears to be a decorative cage. The plain, pale background achieves a new significance as part of this illusion.

Determining the precise extent of Berain's own design work

and that which he delegated to his team of craftsmen is fraught with difficulties owing to the paucity of documentation. He certainly collaborated with other royal craftsmen and artists including the flower painter Jean-Baptiste Monnoyer (1636–99) with whom he worked on tapestries, and the ébéniste Alexander-Jean Oppenordt (c.1639–1715) who executed Berain's designs for the bureau in the Cabinet des Curiosité and a sarcophagus-shaped commode c.1690–95 (Wallace Collection, London). However, the promulgation of Berain's style and the widespread dissemination of his influence is largely attributable to the abundance and subsequent employment of his engraved designs.

Berain engraved only a limited number of designs himself, but about 300 prints were produced by designer-engravers such as Jean and Pierre Le Pautre and Daniel Marot. These engravings, many of which represent adaptations of his work, illustrate the extent of Berain's range not only in designs for ceremonies but also in designs for architectural features, furniture and decorative ornament, and include chandeliers, vases, ironwork, capitals, ceilings, fireplaces and above all panels of decoration. Yet it is undoubtedly as a result of the interpretation of his ideas via engravings that numerous unsubstantiated or erroneous attributions have been made in the past. Today, the frequent use of terms such as "Berainesque" or "in the style of Berain" reflects not only the pervasiveness of his influence but also the difficulties involved in attribution. The highly successful set of *tentures des grotesque* tapestries, designed for the Beauvais workshops c.1690 and still in production in 1725, are often referred to as "Berain Grotesques" but the actual cartoons were painted by Monnoyer. Nevertheless, the designs themselves clearly herald a new stylistic period and contain leafy trellises and fragile architectural constructions resting on slender colonettes that frame a central statue representing either Bacchus or Pan. The foregrounds are enlivened by colourfully attired figures such as animal tamers, dancers, acrobats and characters from the commedia dell'arte.

Berain's most original contribution to interior decoration and design lay in his influence on arabesque and grotesque ornament which provided a vital transitional link between Baroque and Rococo styles of design. Inspired by the forms in Antique wall decoration, grotesque ornament had been transmitted to France from Italy and was employed by, among others, Charles Le Brun at Vaux-le-Vicomte (late 1650s) and the Galerie d'Apollon in the Louvre (1660s). Berain was clearly aware of Le Brun's designs and had been employed to engrave plates depicting the decorations in the Louvre interior in the 1670s. Initially, his own work imitated the style of his immediate predecessors but he gradually developed a lighter and increasingly attenuated ornamental system which although related to the Renaissance *groteschi*, was to lose the more muscular and sinister qualities inherited from 16th-century designs. The most representative of Berain's fantasies are characterised by the hierarchical nature of the decorative elements within a clearly defined structure and border. The framework is organised around a principal central scene or figure which is often situated within an architectural structure or under a suspended canopy. The remaining ornament and figures are distributed as single elements or additional scenes or groups. Berain employed a wide variety of motifs including animals, trophies, terms, swags, scrolls, acanthus and gods. His

monkeys, in particular, represented a novel contribution to design and highlighted not only the move away from traditional grotesque figures such as chimera but also presaged the fashion for *singeries* that was to become such an important part of Rococo decoration and design. The Berainesque grotesque also influenced the sprightlier style of Rococo masters such as Claude III Audran, Claude Gillot, Pierre Le Pautre and others. But, unlike Rococo-style decoration, Berain's own designs remained on the whole symmetrical and were confined within a clearly defined geometric space. Thus, by the end of his lifetime, in comparison with the work of the new generation of ornamentalists, his style was considered old-fashioned. Nonetheless, it had entered the international repertoire of ornament and, as suggested by Jérôme de la Gorce, "Sans lui, l'esthétique de la première moitié du XVIII^e siècle aurait été sans doute différente." (Without him, the aesthetic of the first phase of the 18th century would have been, without doubt, very different).

Biography

Born in Saint Mihiel, Lorraine, the son of a master gunsmith, in 1640. Family moved to Paris c.1645. Studied etching in his father's workshops. Married: 9 children including the designer Jean II Berain; Charles Le Brun was godfather to Berain's daughter Catherine. Active as a designer from mid-1660s; employed as an engraver by Louis XIV, 1670–74. Appointed Dessinateur de la Chambre et du Cabinet du Roi, 1674; appointed royal garden designer, 1677; given lodgings in the Louvre, 1679. Devised decorations and costumes for all the royal ceremonies and entertainments. Also designed decorations and furnishings for the royal palaces, tapestries, textiles, and metalwork. Published numerous engravings of designs for ornament and furnishings from 1659. Died in Paris, 24 January 1711.

Selected Works

Interiors

- 1682–85 Versailles (decoration, furniture and fittings for the Cabinet des Médailles and the Petite Galerie)
- 1687–88 Hôtel de Mailly, Paris (decoration of ceilings and panelling)
- 1688–89 Grand Trianon, Versailles (interiors)
- 1699 Château Neuf, Meudon (attributed: chimneypiece and panelling in the cabinet de Monseigneur): Grand Dauphin

More than 250 of Berain's designs for tapestries were woven, many by Louis-Gui Vernansal the Elder (1648–1728) and Jean-Baptiste Monnoyer (1636–99). His textile designs included embroideries for the Dauphin (1680), chair covers for the Dauphine (1695), silks for Nicodemus Tessin the Younger (1695) and silk portières for Versailles (1701). Some of his furniture designs were executed by Jean Oppenord and André Charles Boulle. His metalwork included a toilet service for the Dauphine (1680) and silver girandoles for Versailles (1700).

Berlage, H.P. 1856–1934

Dutch architect and designer

H.P. Berlage, the foremost pioneer of modern architecture in the Netherlands, attained an international stature in the world of design that surpasses that of any other Dutch figure. In his debt are numerous 20th-century architects, among them Ludwig Mies van der Rohe, Peter Behrens, and members of the antithetical groups, the Amsterdam School and De Stijl. In his copious writings, based initially on the ideas of G.W.F. Hegel, E.E. Viollet-le-Duc, and Gottfried Semper, Berlage developed original proposals for the liberation of architecture and interior design from dependence on historical precedent. From his study of the geometric bases that underlie natural forms, he derived the motto "Unity in Diversity" and his goals of harmony, repose and equilibrium. His aesthetic notions were

filtered through an ethical and political vision that foresaw an egalitarian society and therefore he intended his stylistic principles to be universally valid, free from the whims of passing fashion and materialistic ostentation.

Like many of his contemporaries, Berlage in each commission strove to attain a Gesamtkunstwerk. But unlike most, he himself was a Gesamtarchitekt, to coin a phrase. No project was too large – he developed extension plans for a number of Dutch cities, – or too small – he considered each piece of furniture a microbuilding. He created not only interior spaces and their containers, but designed many of the fittings, whether he was working on a public or private scale. His education from 1875 to 1878 at the Polytechnical School in Zurich, established by Semper, inclined him in this direction; he was trained in ornamental as well as architectural design and his final project there was for a *Kunstgewerbeschule und museum* (School and Museum of Arts and Crafts or Applied Art). Among his earliest executed works were a series of interiors for tasting bars run by the famous liquor firm of Bols; from 1886 to 1895, he created pubs in Amsterdam, Berlin, Bremen, Hamburg, Antwerp and Paris, which included both free-standing and built-in pieces, such as buffets, tables, and fireplaces. However, such establishments were not prophetic of the future products of this avatar of the Modern style; rather they demonstrated Berlage's skill in adapting the Dutch Renaissance mode.

Between 1891 and 1894, Berlage worked on a series of stage designs for the 17th-century masterpiece by Joost van den Vondel (1587–1679) – *Gysbreght van Aemstel*. In addition to exhibiting his debt to Semper's notion of the tectonic arts being based on four materials and techniques (ceramics, masonry, wood, and textiles – pottery, stereotomy, carpentry and weaving), these sets reveal Berlage's interest in the English Arts and Crafts movement; for example, sunflowers are a frequent motif and there are affinities with the work of C.F.A. Voysey. The two-dimensional patterns Berlage employed also resemble those devised by A.W.N. Pugin, although Viollet-le-Duc's interior "restorations" come to mind as well.

Berlage's mature furniture is simple, spare and sturdy, looking back to the Middle Ages but also to ancient Egypt, as Semper had previously done in a famous passage in *Der Stil in den technischen und tektonischen Künsten; oder Praktische Aesthetik* (Munich, 1860–63) referring to Pharaonic chairs. Through Semper also, Berlage had learned to appreciate the nature of materials, and his designs for objects in wood, metal, and textiles reflect his understanding of the structural and formal strategies that ideally are matched with each different substance. He prized the quality of *Sachlichkeit* (in Dutch, *zakelijkheid*), an untranslatable word that suggests focus on the necessary, the essential, the functional. These characteristics did not exclude the aesthetic pleasure and expressive qualities of ornament, however; it was left for later exponents of the *neue Sachlichkeit*, which Berlage detested, to purge all decorative impulses from interior design.

A product of his era, Berlage was also inspired by nature, and his decorative work belongs to one of the two Dutch manifestations of Art Nouveau – that called *Nieuwe Kunst* (New Art), characterized by rectilinearity, abstraction, symmetry, and severity, in contrast to the curvilinear branch, based in The Hague and inspired by French and Belgian work, with its elab-

orate whiplash curves and sensual forms. Berlage was one of the founders in 1900 of Het Binnenhuis (The Interior) in Amsterdam, the foremost purveyor of Nieuwe Kunst for the dwelling; he was among a very gifted cadre associated with that shop whose names constitute a roll of honor of *fin-de-siècle* Dutch decorative designers.

The house of 1898 in The Hague executed for his loyal client Carel Henny, is an excellent example of Berlage's approach to interior design. Planned around a double-height, skylighted stair hall, the Henny House has interior walls of soft red brick trimmed with glazed yellow, blue and white brick and with stone; for the first time in Berlage's domestic architecture the internal walls have been left unplastered to reveal the masonry and unite exterior and interior surfaces. Wooden floors and beams and wrought iron balconies complete the palette of materials. Tables, built-in cabinets, rugs and a grandfather's clock were all specially designed by Berlage for this ensemble.

Berlage was simultaneously engaged on two significant public commissions which have stylistic affinities with the Henny House: the Produce, Grain and Stock Exchange (Beurs, 1896-1903) for the capitalist merchants and traders of Amsterdam, and the headquarters of the Dutch Brotherhood of Diamond Workers (1897-1900) for the most advanced trade union in the Netherlands. The similarity in imagery and materials of two buildings for such vastly different constituencies tellingly illustrates Berlage's belief in an architecture of universal appeal, while the harmony of the interiors with the overall architectural concept demonstrates his fidelity to the *Gesamtkunstwerk*. Lighting fixtures, furniture (including, in the Beurs, specially designed brokers' booths) carpets, wallpaper, letterheads, logos, and calendars conform to the exquisitely sober style of Nieuwe Kunst. Berlage also believed in close collaboration with ornamentalists and craftsmen and both buildings have carved and tiled figurative decoration inside and out designed and executed by prominent artists such as Lambertus Zijl, Jan Toorop, and R.N. Roland Holst. Text is used aesthetically as well as didactically; the slogan *Proletariers Aller Landen Vereeniat U* (Workers of the World Unite!), spelled out in bright glazed tiles, is integral with the masonry of the multi-level stairhall of the Diamond Workers' headquarters. The ornamental patterns as well as the organization of the elevations and spaces were devised, according to a system of geometric proportions, based on the so-called Egyptian triangle, advocated by Semper and Viollet-le-Duc; after 1897, Berlage applied this system to all of his work, including the Henny House.

One of Berlage's most completely realized ensembles is the St. Hubertus Hunting Lodge that was commissioned in 1914 by a pair of his most faithful patrons, Hélène Kröller and her husband, A.G. Müller; indeed he executed a number of projects for this wealthy shipbuilding family. The lodge overlooks a pond in the wooded preserve of De Hoge Veluwe in Gelderland (today a national park). The imagery that governs the plan, massing and decoration of the lodge is based on the legend of St. Hubertus, the patron saint of hunting for whom it is named. The symmetrical plan suggests the antlers of the crucifix-bearing stag which guided the lost saint from the forest and effected his conversion to a life of service and piety; the six-storey tower that crowns the apex of the composition

refers to the cross. Ceramic tiles placed in the walls reinforce the references. Dark wood wainscoting, floors, bookcases, desks and tables complement wall and ceiling surfaces of glazed and moulded brick and tile in green and the primary colors, white and black; the upholstery and carpets are the same hues. Chandeliers, clocks, fireplace utensils, metal-clad doors, and stained-glass windows designed by Berlage and his collaborators complete this thoroughly conceived and magnificently realized fantasy, the work by Berlage that is most closely allied to the current of Expressionism then being propagated in the Netherlands by his younger colleagues in the Amsterdam School.

Thanks to the municipal policy of Amsterdam which during the years 1915 to 1930 turned the new portions of the city into a *Gesamtkunstwerk*, Berlage's large-scale urbanistic plan for Amsterdam South (1903; 1915-17) is complemented by street furniture and bridges sympathetic to the larger ensemble, often designed by members of the Amsterdam School. Berlage himself was responsible for two of the many unique bridges that cross Amsterdam's numerous canals: the second Amstelbrug, of 1906, and the aptly named Berlagebrug of 1928-32.

One of the major architectural works of his last period is the Gemeentemuseum (Municipal Museum) in The Hague, completed posthumously in 1935 but designed over the years from 1919 to 1929. Here Berlage paid particular attention to the display spaces for decorative arts, of which the museum has a fine collection.

HELEN SEARING

Biography

Hendrik Petrus Berlage. Born in Amsterdam, 21 February 1856. Studied painting at the Rijksakademie van Beeldende Kunsten, Amsterdam, 1874-75; studied architecture at the Eidgenössische Technische Hochschule, Zurich, 1875-78. Travelled in Germany, 1879; in Italy, 1880-81; visited the USA, 1911. Married Marie Bienfait, 1887. Practised as an architect in Arnhem, Netherlands, 1879; worked in the office of the engineer Theodorus Sanders, Amsterdam, 1881-84; in partnership with Sanders, 1884-89; independent practice in Amsterdam and The Hague, 1889-1934. Active as a designer of furniture, ironwork, lighting and glass from the 1890s; opened Het Binnenhuis, a combined furniture and crafts workshop and saleroom, with Jacob van den Bosch and W. Hoeker, in 1900. Published several books and articles on ornament and design and, an acknowledged authority on modern architecture and design, he was a delegate at the first Congrès International d'Architecture Moderne (CIAM), Geneva, 1928. Awarded a Gold Medal, Royal Institute of British Architects, 1932. Died in The Hague, 12 August 1934.

Selected Works

The largest collection of drawings, designs and documentation relating to Berlage's work is the Berlage Archive, Nederlands Documentatiecentrum voor de Bouwkunst, Rotterdam. Examples of Berlage's furniture are in the Stedelijk Museum, Amsterdam, the Rijksmuseum Kröller-Müller, Otterlo, the Gemeentemuseum, The Hague, and the Centraalmuseum, Utrecht. A complete catalogue of Berlage's architectural projects and designs for decorative work appears in Polano 1988.

Interiors

1893-94 Arti et Amicitiae, Amsterdam (clubroom interiors and furnishings)

- 1894–95 De Nederlanden van 1845 Insurance Company Building, Amsterdam (building, interiors and furnishings)
 1895–96 De Nederlanden van 1845 Insurance Company Building, The Hague (building, interiors and furnishings)
 1896–1903 Stock Exchange (Beurs), Amsterdam (building, interiors and furnishings)
 1897–1900 Headquarters of the Dutch Brotherhood of Diamond Workers, Amsterdam (building, interiors and furnishings)
 1898 Villa Henny, The Hague (building, interiors and furnishings): Carel Henny
 1900 Villa Parkwijk, Amsterdam (building, interiors and furnishings): Leo Simons
 1914–20 St. Hubertus Hunting Lodge, Otterlo, Netherlands (building, interiors and furnishings): Kröller-Müller family
 1919–29 Municipal Museum (Gemeentemuseum), The Hague (building and interiors)
 1920–27 De Nederlanden van 1845 Insurance Company Building, The Hague (building, interiors and furnishings)

Berlage also designed furniture (much made in Het Binnenhuis workshop), graphics, textiles, lighting, metalwork and wallpapers.

Berlin School

The term “Berlin School” (Schmitz) refers to those architects who were active in Berlin during the last decade of the 18th century and who belonged to the circle of the Private Society of Young Architects, founded by Friedrich Gilly in 1799, or who were students of David Gilly at the private school of civil engineering he founded in 1793 (which became the State Academy of Civil Engineering in 1799). Of particular note are the architects Friedrich Gilly (1772–1800), Heinrich Gentz (1766–1811), and Carl Gotthard Langhans (1732–1808), but the young Karl Friedrich Schinkel (1781–1841) who came under the mantle of Friedrich Gilly's intellectual legacy in 1800, is also a significant figure. These architects were moulded by ideas of classicism and of “revolutionary architecture”, but they also each developed individual forms in which the nature of their transposition of antique models (Greek as well as Roman) varied. While David Gilly's designs still included elements from the late Baroque, Gentz and, in particular, Friedrich Gilly detached themselves completely from this style. Their forms of architecture, influenced by the cube, the pyramid and the triangle, are generally labelled with the (questionable) term “revolutionary architecture”. Although Berlin was the centre for these architects, they erected significant buildings outside Berlin and Prussia, such as David Gilly's Vieweg House in Brunswick (completed in 1804) and Heinrich Gentz's Weimar Castle (1801–03). Numerous plans were extant until 1945 and are reproduced in older monographic works. Like the Berlin buildings themselves, many of these documents were destroyed during the war.

David Gilly (1748–1808) was summoned by King Friedrich Wilhelm II to Berlin in 1788, where he had a formative influence on the young architects of the Berlin School. In 1796–97 he built the castle and the village of Paretz for crown prince Friedrich Wilhelm (III), which can be regarded as the most important work of his Berlin period. The “Paretz Sketchbook” – views and ground plans drawn up by Martin Friedrich Rabe – provides an impression of the original state and coloration of this work (M. Lammert). The building's exterior – a long, rectangular structure divided by offset ribbing and window axes with little architectural modelling – makes no reference to the structure of the interior. The exclusion of the flight of entrance steps beyond the actual entrance area and the separation of the vestibule represent an innovation when compared to magnificent Baroque stairways. Unfortunately, the building is destroyed and further indications of the interior design no longer exist.

Gilly's house for the publisher Vieweg was completed in Brunswick in 1804. Here the architect had to accommodate not only sumptuous living quarters, but also the premises of the publishing business. The offset ribbing arrangement of the exterior structure finds its correspondence in the interior's oval ground plan. The stairwell with its flight of entrance steps also has an oval ground plan. There is no information about the

Berlin School: staircase hall Weimar Castle, by Heinrich Gentz, 1801-03

original layout of the interior, which had already been altered many times by the 19th century. Restoration has shown that exposed remnants of paint originate from the 19th century. The interior designs of other buildings by David Gilly are not known, and his actual influence on his followers' structuring of interiors is therefore difficult to determine.

Gilly's son, Friedrich, had a lasting influence on his circle of friends and followers, including Schinkel, although owing to his premature death only a few of his architectural designs were realised. His design for the monument to King Friedrich II (1797) was particularly significant. Gilly can be regarded as the focal point of the Berlin School, as the decisive impulses came from him, and his death signified the end of the Private Society of Young Architects as a communal forum for discussion. However, both his father David Gilly and Carl Gotthard Langhans were already active in the years before Friedrich's period of activity and influence in Berlin. Although most of his designs concentrate exclusively upon the exterior of buildings and only a few drawings give an impression of his ideas for a building's interior (catalogue, Berlin 1984), it is clear from both photographs and drawings of completed projects (1794: drawings of the Hochmeister's Palace of Marienburg, East Prussia) and from his sketches and designs that Gilly's preoccupation with the interior design dates from the early period of his work.

The idea of a grave monument occupied him repeatedly and he planned its interior in a wide variety of forms. In 1791 he designed a pyramid (Oncken, plate 136) whose interior forms a large rotunda. Sixteen columns support a low tambour over a plain entablature, above which the vault of the cupola rises. The sarcophagus is located in the centre of the space, flanked by two sphinxes. Four rectangular air shafts illuminate the cupola. Echoes of a design for a mausoleum by Langhans Senior from 1784 (Schmitz, illus. p.33) are clear, but Gilly's design appears more monumental and is reduced to the essentials. In 1796, Gilly designed a tomb (Oncken, plate 19C), which he planned as a grotto with coffered barrel vaulting and a socle wall which juts out as a solid bench. Compared with this, the construction of space in a catacomb from c.1795 (Oncken, plate 21), which Gilly planned as a place of burial, appears more sumptuous. Powerful pillars support coffered girders, lateral passages cut like Gothic vaults into the vaulted surfaces between the girders. A deep door recess with a broad flight of stairs forms the entrance to the room on one long side of its rectangle; the room is illuminated only by a semi-circular window above the door. Just as these three mausoleum designs demonstrate clear differences – with common elements only appearing in the extensive abandonment of decoration – so the rest of Gilly's plans diverge from each other.

Gilly built up the plan for Berlin's National Theatre (1798–99) in some 40 sketches and designs, in which his search for a cohesively developed, unified interior is just as discernible as his variation of certain ordering and formal elements, for example, the positioning of the columns along the walls of the boxes and the design of the ceiling. The definitive design differs fundamentally from the earlier versions in its treatment of the walls of the boxes and in its ornateness and the working through of its decorative details (Oncken). The stage is covered by a star-shaped coffered barrel vault; the stalls are bordered by the fluent lines of the boxes' socle wall, decorated with a

hanging palmette frieze. The middle box projects outwards and is thus accentuated. It is framed by columns that support an entablature that is decorated by a frieze and that runs along the plain walls of the boxes as a figural frieze. The ceiling is structured in a richly varied way; a segmented arch with organic and ornamental decoration spans the stalls. A half-barrel vault adjoins this, spanning the boxes adorned with a meander frieze and organic forms which run towards a central point.

Friedrich Gilly's concern with the interior design of residential buildings is evident from some of his plans, but what he planned for the external structure of these buildings is for the most part unknown. The walls of a vestibule (Oncken, plate 70b) are divided by Ionic columns, half-columns and pilasters, and the sections of this wall resulting from these divisions, lying above a cranked socle band, are further divided by an entablature decorated with festoons. Gilly also designed a garden room with an octagonal ground plan. A cranked socle strip and a horizontal ledge, which forms a transition to the vault, frame the space. The upper third of the wall of this room – which was possibly conceived as an anteroom – was decorated with incised reliefs. A variety of furniture designs, which had an influence on Schinkel's early designs, have also survived. But only a fraction of Gilly's designs are still available in the original; most have been missing since 1945. Moreover, hardly any of Gilly's plans were actually executed, yet his effect on friends and followers was profound.

Heinrich Gentz was one of Friedrich Gilly's closest friends and a co-founder of the Private Society of Young Architects. His Berlin Mint, built between 1798 and 1800 and demolished in 1886, was one of Berlin's important classical buildings; sadly, however, nothing is known of its interior design. Gentz proved himself as an interior designer primarily with Weimar Castle. Large sections of this castle were destroyed by fire in 1774. The work of rebuilding and newly constructing the castle using old stonework extended well into the 19th century. In close contact with Johann Wolfgang von Goethe, Gentz's chief designs were for the banqueting hall, the gallery (*Falkensaal*) and, most significantly, for the stairway in Weimar. Out of the narrow, low space of the gallery, a space which was also blocked off at either end, Gentz created a state room. He extended the room visually by having it open out into semi-circular niches on the short sides of its rectangle and he spanned the room, which had previously been flat-roofed, with a coffered barrel vault in the shape of a basket-arch. He let in small niches opposite the windows, and the two features together lent the room a lively rhythm.

While the proportions of the gallery had already been laid down, Gentz was able to intervene to a much greater extent in the layout of the stairway. Doric columns and a frieze of metopes and triglyphs running below the ceiling constitute the principal formal elements. The columns set off the actual run of stairs from the upper landing and also serve to support the ceiling above a powerfully-formed architrave. Three large reliefs by the Berlin sculptor Christian Friedrich Tieck (1776–1851) decorate the upper stairway and symbolise the influence of the sovereign. Tieck also created eight plaster statues in 1803 in close cooperation with Goethe, four of which were installed on the stairway. It is very likely that they were part of Gentz's overall conception. Areas of free-standing

sculpture and reliefs create tense contrasts with the large sections of wall that are left free and unordered.

The banqueting hall occupies two floors and is surrounded by a series of columns that support galleries on the hall's short sides. The rhythm that is created by the series of columns is taken up by the succession of doorways and niches into which sculptural figures have been set. A griffin frieze that runs around the hall and the powerful, embellished architrave together provide a vertical counterweight to the columns which emphasise the horizontal. The design for the ceiling is not by Gentz, but by his predecessor in Weimar, Nicolaus Friedrich von Thonnet (1767–1845). The design of the rooms seems to be oriented towards a heightening of their splendour and of the ceremonial impression that they create. From the simple entrance hall and the stairway to the banqueting hall, Gentz moved towards a richer and more vibrant style of decoration and a predominance of elements in the Ionic style (Jericke and Dolgner).

With Goethe's cooperation, Gentz built a small theatre in Bad Lauchstadt (between Merseburg and Halle), the favoured spa of the Weimar court around 1800, that was opened in 1802. The theatre consists of a three-storey fly tower and a two-storey auditorium of the same width, which is served by a low entrance hall. The interior has a simple layout. The auditorium, which ends in a semicircle, has dress circle galleries at the back and galleries continue at the same height at the sides. The ceiling's barrel vaulting is decorated with fine ribbing, which has the effect of ruffled canvas. The auditorium is kept simple and all embellishment is sacrificed, except for paintings in the Pompeian style.

Gentz did not build anything else in Berlin until 1810 when he designed plans for the Princess Palace, although the only part of this building to be executed was part of the exterior's offset ribbing. Queen Luise's mausoleum in the grounds of the Palace of Charlottenburg was designed by Schinkel on King Friedrich Wilhelm III's own brief; Gentz was simply responsible for the construction as the leader of the court's planning department and building office (Hofbauamt). The layout of the repeatedly-extended interior cannot be traced back to him.

Carl Gotthard Langhans was of the same generation as David Gilly. Although the first buildings of his Breslau period, such as the former Hatzfeld Palace in Breslau (1766–73, fitting out of the interior until 1786), already betray a leaning towards classicism in their exteriors, their interiors are still clearly linked to the Rococo style. Director of the newly-created planning department and building office (Hofbauamt) in Berlin from 1788, Langhans was repeatedly enlisted by the court in the renovation of its castles, such as those in Rheinsberg and Potsdam (Marble Palace; Orangery). In 1788 he designed the Charlottenburg Palace's theatre, which was opened in 1791. The interior fittings were destroyed during major rebuilding work in 1902; few drawings or photographs show Langhans's interior design. The auditorium had three circles, supported by palm-shaped corbels. These, along with the ceiling with its false parapet and heavenly sea of clouds painted by Cunningham, constitute the only indication of the original design. In 1789–91 he created the Brandenburg Gate, his best-known work, a work which clearly shows Langhans's move towards classical forms and which betrays references to the Propylaeum in Athens.

Langhans's son, Carl Ferdinand Langhans (1782–1869), was a member of the Private Society of Young Architects. His buildings, which were erected after the Wars of Liberation, are oriented more towards Schinkel's work than towards that of Gilly's circle during the last decade of the 18th century. Works such as the New Theatre in Leipzig (1864–67) are thus no longer influenced by the Berlin School with its commitment to "revolutionary architecture".

The term Berlin School is problematic. The different architects each developed their own specific conceptions, which, in the realm of interior design, have mostly been only hazily preserved. Common ground between designs by the architects Friedrich Gilly and Heinrich Gentz, or especially between those of Langhans Senior and Langhans Junior, is hard to establish. The expression Berlin School may only indicate, therefore, that Gilly, Langhans and Gentz conversed with each other in the last decade of the 18th century and in the early 19th century and, united by the Private Society of Young Architects, sought new forms together, turning away from the formal vocabulary of the Baroque while rediscovering the architecture of the Greeks and Romans. A common formal programme, such as that in Schinkel's day, was not a feature of the Berlin School.

Berlin Woolwork

Berlin woolwork was a type of counted thread embroidery on mesh canvas popular in western Europe and North America during the first three-quarters of the 19th century that was characterized by bright colors and naturalistic designs. In

Berlin Woolwork: design for three prie-dieu chairs from Henry Wood's *A Useful and Modern Work on Cheval and Pole Screens ... for Mounting Berlin Needlework*, 1846

domestic interiors Berlin woolwork was used for chair seats and backs, footstools, firescreens, sofa seats and backs, pillow covers, valances, table covers, rugs, framed pictures, and many smaller accessories.

Counted thread work on canvas has been done since ancient times. From the time the first printed pattern book appeared in Germany in 1523 until the early 19th century, counted thread patterns were printed in black and white on a grid background, with color changes indicated by different symbols in the squares. Needleworkers who wanted to work from a colored design had their canvases painted by professional artists, and then worked stitching over the paint. In 1804 a Berlin print-seller, A. Philipson, produced *Colorirte au 12 Blatt bestehende Muster* published by H. Kronberger-Frentzen. These were colored designs on point paper, a printed grid similar to graph paper. The patterns became generally available throughout western Europe within a year, but they were not as popular as expected.

In 1810 the Ludwig Wilhelm Wittich firm in Berlin began issuing patterns with hand-colored squares to designate colors. The Wittich patterns were, and still are, considered to be the best of their kind. The patterns soon became known as "Berlin patterns" and the resulting needlework was known as "Berlin work" or "Berlin woolwork". The patterns were exported to England, Russia, Sweden, Denmark, North America, Holland, Belgium, Switzerland, Italy, Spain, Portugal, Australia, and New Zealand. Publishers in Vienna and Paris soon began issuing patterns, and women's magazines such as *Godey's Lady's Book* (1830–98) included patterns as part of a continu-

ing campaign to encourage women to occupy their time in making decorations for their homes. These patterns were often accompanied by instructions for doing the work.

The colored patterns were immensely popular with amateur embroiderers, who had only to match their yarn to the colors on the pattern and stitch over one warp / weft intersection of the canvas for each square on the pattern. Favored subjects were flowers, animals, sentimental figures, and popular paintings. Berlin patterns became very complex with realistic shading and detail.

Berlin woolwork pieces were executed with blunt tapestry needles primarily in the half-cross tent stitch or in cross stitch. Other canvas stitches were used, but the complexities of the shading in most of the patterns precluded the use of stitches that covered more than one square of the design. Small beads on silk threads were sometimes added to highlight portions of the design. Other variations included plushwork, introduced in the 1840s, consisting of long loopy stitches either left untrimmed or trimmed to create a fuzzy surface or a sculptured pile of three-dimensional birds or flowers. The sculpturing usually had to be done professionally. An imitation of black lace worked in silk or wool called "canvas lace work" was introduced also in the 1840s, and was used on cushions, ottoman tops, lamp mats, and table covers.

When Berlin patterns were first published, the work was done on silk canvas with silk thread. In the 1820s Berlin wool, or Zephyr Merino, yarns from Merino sheep in Saxony, were spun at Gotha in Germany, then dyed with natural dyes in Berlin. By the 1840s the wool was being produced in other

countries. The wool had high bulk and only a little twist, and was available in various weights. It was softer and thicker than the crewel wool used for embroidery in the 18th century. The wools were dyed in bright colors to match the colored patterns, and became even brighter with the introduction of synthetic aniline dyes in 1856 by William Henry Perkin. The bright aniline colors were popularly called "gaslight" colors. The first was a purple known as "Perkin's mauve" followed in 1860 by magenta. Aniline dyes faded after exposure to light, but this did not diminish their popularity.

Although Berlin wool was soft, tight stitching on canvas made it suitable for upholstery, and it was not as subject to wear as the raised stitching of the earlier crewelwork. Since the work was done mounted on a frame, it was possible to do fairly large pieces without distortion. Some sofa seats and backs, and rugs were done, but smaller pieces were more common. Patterns designed specifically for pieces such as chair backs were shaped to fit. Heavy jute or cotton canvas was embroidered for upholstered furniture, and the finished work was mounted professionally. On many pieces the entire background around the design was covered with stitching, but sometimes the worked design was cut out and appliquéd, or sewed, to a cloth background. Designs could also be worked directly on cloth using the waste canvas method, in which the stitching was done over canvas laid on the cloth, and the canvas threads removed after the work was completed.

There was little attempt to relate Berlin woolwork upholstery designs to the style of the furniture on which they were mounted. The same naturalistic flowers could be found on any style of seating piece. In 1846 Henry Wood's *A Useful and Modern Work on Cheval and Pole Screens, Ottomans, Chairs and Settees for Mounting Berlin Needle Work* showed many styles of furniture all with similar floral-patterned upholstery. Firescreens and framed pictures often had copies of popular paintings, biblical lithographs, or famous persons such as the Prince of Wales and George Washington. The pictures resembled German and Austrian painting styles of the Biedermeier and Realist periods and the Troubadour style in France. Bird designs, usually parrots and macaws, were used for firescreens, cushions, and decorative panels. In the 1830s and 1840s floral wreaths and bunches of flowers were set on a light background. By the 1850s large flowers on a black background set off the bright colors. After 1850 there was a trend toward geometric designs in neo-Gothic style. These allowed for a greater variety of stitches, in particular the leviathan or railway stitch (now known as Smyrna cross) which covered four squares instead of one, and the perspective stitch in which graduated lengths formed a cube that appeared to be three-dimensional. Colors became more muted in the 1860s, and floral designs gave way to Greek key borders, folded ribbons, diaper patterns, ornamental scrolls, arabesques, and formalized acanthus and vine leaves. Large seating furniture was no longer covered with Berlin woolwork, as cushions and footstools predominated.

A perforated paper called Bristol board was introduced in the 1840s and was at first used for small items. From the 1870s to 1900 large mottoes and pictures worked in wool on Bristol board hung on walls in middle-class homes. Designs were printed directly on the paper, and the background was not filled in. Simple mottoes such as "Home Sweet Home" or elab-

orate renderings of the Lord's Prayer or the Ten Commandments were worked in shaded wools. A variation depicting ships known as "woolies" was done by British sailors. Even the paper Berlin patterns themselves were sometimes framed and hung as works of art.

Criticism was directed at Berlin woolwork from several sources. Since it dominated the needlework done by the middle and upper classes in western Europe and North America during its period of popularity, there was some complaint in the 1840s from church authorities that church needlework was suffering because the designs were not suitable for ecclesiastical use. The designs, which admittedly varied in quality, were attacked on artistic grounds by William Morris and others, particularly after the rise of the Arts and Crafts movement in the 1860s. Berlin work was considered too easy and simple-minded by some critics, a criticism that seems unjustified given the complex shading and multiple color changes required to execute most of the designs. Others decried the lack of originality on the part of the stitchers, also a somewhat unrealistic complaint since needleworkers have traditionally worked from designs created by others.

These criticisms did not have any effect on the needleworkers. The demise of Berlin woolwork, when it occurred in the 1870s, was the result of a new fad, art needlework, taking its place. William Morris, who established his own firm, Morris, Marshall, Faulkner & Co., in 1861, introduced the style in his own embroidery, and it was further advocated by the Royal School of Art Needlework, established in London in 1872. In America, Louis Comfort Tiffany and Candace Wheeler supported the new art needlework. The Philadelphia Centennial Exposition in 1876 had a large exhibit in the Women's Pavilion from the Royal School of Art Needlework that impressed many fairgoers with the new style. By 1900 the popular ladies' magazines had discontinued Berlin patterns, and few were published after that. Some needleworkers, however, continued to work from the old patterns until the 1930s when production of the Berlin wools was discontinued. In the late 20th century there has been renewed interest in collecting the old Berlin patterns and reproducing the work using modern materials.

Biedermeier

The Biedermeier style dominated Central European tastes in furniture and interiors during the Vormärz, or Pre-March period, which lasted from the Congress of Vienna in 1814 and 1815 through to the March revolution of 1848. The Congress of Vienna signalled the end of the Napoleonic Wars and their attendant violence and instability, and the Austrian Empire – which included all of present-day Austria and Hungary, as well as much of the western part of what is now the Czech Republic – benefited enormously from increased prosperity and economic growth in the following years. Its capital, Vienna, became a natural magnet for the many craftsmen and artists, as well as the flourishing merchant classes who were exploiting their new-found freedom to trade and travel between states. Even as early as 1816, 875 independent master cabinet-makers were active in Vienna, and this figure had by 1823 risen to 951.

The name “Biedermeier” itself was coined some time after the period, and in fact was far from complimentary. “Biedermeier” is commonly attributed to the satirical writers Adolph Kussmaul (1822–1902) and Ludwig Eichrodt (1827–92). Their pseudonym, Gottlob Biedermaier, was a fictional author whose self-satisfied insularity symbolised all that was regarded as being negative about his era. “Bieder” means plain, everyday, and “Meier” (or Maier) is the German equivalent of the surname Smith. Hence the term was a scornful reference to the flourishing and newly-influential bourgeoisie with their largely materialistic values and their limited aspirations, during the first half of the 19th century. Although it was initially used in connection with literature and painting of the period, the appellation “Biedermeier” is today most often associated with furniture and the decorative arts.

In many ways the development of the Biedermeier style mirrors the arrival of the Industrial Revolution in Central Europe and its far-reaching changes in culture and society. No longer were fine furniture and furnishings the preserve of the aristocracy; a new market emerged with the rise of the bourgeoisie, at the same time as new production techniques were bringing down the cost of a wide range of luxury goods.

Although precise definitions of the style have been the subject of arcane debates among Austrian and German art historians for decades, Biedermeier furniture is generally held to be that produced in the Austrian Empire and the Germanic States in the late Neo-Classical period from around 1810 to 1830, and in the transitional period to the widespread adoption of Historicist styles from around 1830 to 1850. Neo-Classicism is often represented as an austere backlash against the extravagances of Rococo, but it was not a complete break with the past; many of the characteristics of that style lingered on in a diluted form in early Biedermeier pieces, in the form of bronze mounts and elaborate asymmetrical figurative ornament. The work of Benedikt Holl (c.1753–1833) is typical of

this formative period. His pieces, including ladies’ writing tables adorned with fine inlays, were in some ways a throw-back to the traditions of technical virtuosity and exclusivity of the previous century, although there is in his work a clear shift toward the integration of decoration with structure which is characteristic of later “high” Biedermeier.

Many of the finest pieces of early Biedermeier furniture were executed as masterpieces; virtuoso demonstrations of a craftsman’s skill and his maturity. These were frequently taken directly from the pattern books of the time, such as the *Cabinet-Maker and Upholsterer’s Drawing Book*, published by Thomas Sheraton (1751–1806) in London from 1791 to 1793, and the *Modell- und Musterbuch für Bau- und Möbel-Tischler*, published in several editions by Marius Wölfer from 1826 to 1836. A distinctive secretaire by Adolph Friedrich Voight, who was active in Berlin between 1805 and 1826, is closely based on a published Sheraton design. It displays many of the characteristics of later Biedermeier furniture: an essentially simple design, borrowing lyre-form legs from the language of Neo-Classicism, and one which is immensely practical, combining as it does the functions of a writing desk and of a screen in the same piece.

This characteristic preoccupation with multi-purpose furniture was however not ingenuity merely for its own sake. Patterns of life were changing; an increasing urban middle class brought far higher population density – especially in Vienna, whose population grew from around 300,000 in the 1820s to 430,000 in 1857 – together with a higher level of ownership of luxury goods such as fine furniture. The result was an entirely practical fashion for space-saving and dual-purpose pieces. The new middle classes could not afford to furnish both lavish reception rooms and comfortable living areas separately; hence the popularity of pieces such as the *Couvertrahmen*, a traditional upholstered wooden frame which covered the bed and bedclothes, enabling the bedroom to be used as a semi-formal living room in the daytime.

The spending power of the middle classes also gave early Biedermeier another of its distinctive traits, in its rejection of expensive materials and labour-intensive processes for ones which were cheaper and more suited to the new, semi-industrial production techniques. Stained pear wood frequently serves as a substitute for ebony, for example. The cast bronze gilt mounts which echoed the earlier Empire style were copied in thin stamped brass plate, and patinated bronze castings were modelled in composition instead. Ultimately, this applied decoration died out completely; gilt mounts, for example, appear with declining frequency until around 1825; similarly, complex inlay and marquetry, which the early Biedermeier craftsmen had imitated with pen and ink, also diminished in popularity. Technological developments such as veneer cutting machines – which could produce continuous, large sheets of veneer by “peeling” wood from the outside surface of the log through to the heart wood – enabled designers and craftsmen to break free of the cost and limitations of traditional furniture manufacture. Veneers could be made more uniform in their grain and thinner, hence more elastic, making them ideal for covering complex curved surfaces.

The most successful craftsman and entrepreneur of the Biedermeier era was Josef Danhauser (1780–1829), who demonstrated the changing tastes and values of the period. His

Biedermeier: re-creation of a period interior by Rupert Cavendish Antiques, 610 King's Road, London SW6 2DX

Wiennese Etablissement für alle Gegenstände des Ameublements (Establishment for all furnishing objects), established in 1807, was a huge concern, employing more than 130 workers within a year, whose catalogues listed such unlikely combinations as a pipe rack and rifle stand, as well as a vast range of the more orthodox items such as tables, chairs, settees, plant stands, washstands, desks and other miscellaneous pieces of furniture. Concentrating initially on luxury goods, it expanded its activities in 1814 to cover all types of furniture. While the sheer scale of his factory and showrooms – particularly after the move to the Karoly Palace in 1825 – indicate that the middle class was his main market, Danhauser also enjoyed the patronage of the aristocracy; he was responsible for the interior decoration of the Archduke Carl's palace in Vienna in 1822, and for Schloss Weilburg in nearby Baden at around the same time. After Danhauser's death in 1829, the company struggled on for a further ten years, after which it ceased trading. Although very few pieces survive that can be positively attributed to Danhauser's emporium, apart from those commissioned specifically for Schloss Weilburg, a wealth of graphic material remains which illustrates the diversity and imaginative use of form that typify his work. Drawings from his factory show more than 2,500 different designs, and indicate the gradual transformation of the Biedermeier style. The use of the Neo-Classical vocabulary became more and more bold, as small-scale decorative work diminished, so that, in his later designs, Danhauser has moved toward large scrolls and simplified lyre-forms, often serving as structural elements rather than superficial ornament. This tendency was reflected in Biedermeier designs generally; the lyre-form became a characteristic form for sofas and secretaires, and volutes – the spiral scrolls which adorn the capitals of classical columns – served as both visual and structural links between horizontal and vertical planes.

Another important figure was Michael Thonet (1796–1871) who, of all the furniture designers and craftsmen associated with the Biedermeier period, was the individual who most clearly grasped the new possibilities of industrial production, and whose work is most immediately familiar today. In the 1830s, he began experimenting with thin strips of beech and walnut veneer, glued together in a sandwich to form a new material which was tremendously versatile, as well as being very economical. This material could be formed into elaborate curves without waste, and, since it had no grain, was equally strong in all directions. Thonet found that solid wood could also be formed in this way, and it was his success with these techniques that led to his involvement in the decoration of the Liechtenstein Palace with the architect Carl Leistler (1805–57) between 1842 and 1849. Even today, Thonet's work is commonly seen in the ubiquitous and widely-copied bentwood cafe chair. While the bulk of Thonet's work came at the end of the Biedermeier period, and is frequently associated with the arrival of Historicism and the Second Rococo, it displays a preference for bold, decorative structure rather than simple embellishment, and in this respect is typical of high Biedermeier.

The primary influences on the Biedermeier interior were the general need to economise on space, and the shift from the conspicuous display of wealth that had characterised aristocratic tastes to the more modest, informal and above all

comfortable style preferred by the middle classes. Indeed, the Biedermeier era was remarkable for the way in which the aristocracy emulated the increasingly independent and self-confident tastes of the emerging bourgeoisie, rather than vice-versa.

Colours in Biedermeier interiors were surprisingly vibrant, and were driven by the gradual technological advances in the use of pigments and dyes which enabled stronger and more saturated colours. Few examples of wallpapers and furnishing fabrics survive, owing to their inherent fragility; however, samples from the pattern books produced by the silk weavers, protected from the effects of light, illustrate a fondness for vivid, dazzling colours in bold, simple patterns. A favourite pattern both for wallpaper and printed and woven textiles is a broad stripe, often containing a repeated motif such as foliage or flowers, bordered by a narrower contrasting band, set on a neutral or contrasting background. As with furniture, there was a fascination for simulation; *trompe-l'oeil* mural painting simulated expensive relief plaster moulding, and mock watered-silk textile prints alluded to the real thing.

From the 1820s onward, textiles and drapery began to dominate the domestic interior. The vogue for elaborate festoon curtains soon spread to furniture, and the Josef Danhauser catalogues illustrate richly-upholstered sofas and chairs, and other furniture virtually enclosed in the folds of curtains and valances.

The rapid advance of urban development, and increasing industrialisation, was balanced by a nostalgia for nature and the natural world, a theme that had its seeds in the Romantic movement in art, literature and philosophy in the late 18th century. The image of an innocent, pre-industrial rural idyll was one to which writers of the Biedermeier era contributed with great enthusiasm, including Adalbert Stifter (1805–1868) in his novel *Der Nachsommer*. A similarly sentimental view of life in a subsistence economy was promoted in paintings by Biedermeier artists such as Rudolf Alt (also known as Rudolf von Alt; 1812–1905) and Ferdinand Georg Waldmüller (1793–1865). Its manifestation in the public sphere was represented by the Viennese obsession with parks, including the Prater and the Augarten, and in the private sphere by rich displays of indoor plants and flowers, together with a fashion for caged birds. Whether there were any buyers for the eccentric jardinière-cum-birdcage-cum-fishbowl illustrated in one of the Danhauser catalogues is unknown, however.

The Biedermeier style brought with it a domestic atmosphere which placed far more emphasis on comfort and family life than on external display of wealth. It was this private, introspective approach to domestic life that gave rise to the image of the stolid merchant Herr Biedermeier, too concerned with his own little materialistic world and too complacent to pay any attention to the momentous events in international affairs that were shaking the rest of Europe to its very foundations.

Biedermeier has in the past offered an easy target for critics. For some, it signalled the end of the age of craftsmanship, and the beginning of the slide into mass production. For others, it is a style of the philistine *nouveaux riches*, lacking the individual conviction and authenticity of "real" Neo-Classicism. In spite of this, the Biedermeier style had a major influence on successive generations of furniture designers. The work of the Vienna Secession in 1897 and the Wiener Werkstätte, estab-

lished by Josef Hoffmann (1870–1956) in 1903, echoed both the theatrical aspects of late Biedermeier, and its attention to the practical concerns of production. The Art Deco style of the 1920s and 1930s owes an even more striking debt to late Biedermeier furniture, with its regular geometric solids and bold, simple vocabulary of form; indeed, some pieces of Art Deco furniture were straight copies of Biedermeier originals conceived a century before. Michael Thonet provided a model of elegance in design with efficiency in production that was frequently cited by architects of the Modern Movement, including Marcel Breuer at the Bauhaus, and the Swiss architect Le Corbusier.

DOMINIC R. STONE

Principal Collections

The Austrian Museum for Applied Art (Österreichisches Museum für angewandte Kunst), Vienna, holds an important collection of over 2,000 original drawings for furniture by Josef Danhauser and a number of pattern books illustrating decorative schemes for interiors by the *ornemaniste* and designer Franz Weiner. Collections of Biedermeier furniture and decorative objects are in the Austrian Museum for Applied Art, the Palais Liechtenstein, and the Wiener Glasmuseum, all in Vienna.

Billiard Rooms

The origins of the billiard room, as of billiards itself, are obscure. Nothing is known of the game’s precise beginnings, which some take back to ancient Greece, but plentiful allusions in the 16th and 17th centuries place its practice in France, where it may have originated, and England. In the 1670s the diarist John Evelyn, for example, noted billiard tables in houses which he visited in Ipswich and Deptford. In view of the scarcity of authentic examples from this early period, a record surviving from 1588 and stating that the Duke of Norfolk owned at Howard House “a billyard bord covered with a greene cloth wth a frame of beache wth fower turned postes”, has great value. It is clear that the characteristic green colour of the table-covering material (possibly a visual reference to outdoor ball-games played with mallets on grass) was established early.

The beginnings of the billiard room as a space specifically set aside for the game are equally hard to trace. During the 16th century billiards was regarded as an important form of indoor exercise and Louis XIV was advised to play the game for this purpose. The bending positions required for stroke-play, and the measurements of the table itself – twelve feet long, six feet wide, two feet ten inches high, which became standard in England – make it easy to see why a large space, like a great hall or drawing room, might be preferred. Yet the advantages of social intercourse in such a room with non-playing members of a household had to be set against the disadvantages to the players of interrupted concentration, and to non-players of the noise of the balls.

A painting of about 1745 from Hogarth’s circle (Christie’s, London) shows gentlemen playing billiards in what looks like a specialised space. The table appears to be full-size, and no other furniture impedes the players’ movements. Hats, wigs and swords hang on the wall and maces – the predecessors of cues – are in position in a rack further along it. Billiard rooms are also sometimes found in large country houses in France during this period. The designer Briseux advised placing them away from bedrooms on account of the noise, and the frequency of accidents led the architect J.-F. Blondel to recommend simple wooden panelling rather than paintings and mirrors as decoration.

In the later 18th century, as billiards became increasingly fashionable, and if space and funds allowed, rooms designed primarily or even wholly for the game might be added to the private house. An element of novelty or unconventionality which such a development might convey was signalled at Cairness House, Aberdeenshire, in 1793, when a billiard room was planned by James Playfair, working for Charles Gordon. This was a neo-Egyptian interior – the first in Britain – in an

Billiard Rooms: Moorish-style billiard room by S. C. Capes, Newhouse Park, St. Albans, Hertfordshire, 1897

otherwise Greek Revival house. On the Continent the billiard room shared in the taste for the grandiose represented by the French Empire style. A decorative scheme by Léger for a palatial French billiard room of the 1840s (Musée des Arts Décoratifs, Paris) shows how this style might convincingly provide the setting for a wide-spreading, architectonically-conceived billiard table with twelve legs joined by stretchers.

Social developments in the 19th century also affected the billiard room in several specific ways. With the introduction of modern urban lifestyles after the French Revolution and the Napoleonic Wars, billiard rooms were added to some of the famous 18th-century cafés in Paris and other cities. Paganini records himself in 1813–14 pursuing his taste for the game at a café in Milan. Though billiards had been played by men and women together and continued to be so enjoyed, the British trend towards the segregation of the sexes, which had long manifested itself in the fashion for men's clubs, began to develop a counterpart in larger houses with the provision of what were in effect male suites. Associations with gambling (which earned the game the moral disapproval of some Victorians) took billiards readily into this male domain and

also carried overtones of a licence that was available to men but not to women. The pairing of the billiard room with the smoking room – another obvious “male” preserve – was well established by the mid-century, when Castle Carr, near Halifax, grouped library, smoking room and billiard room together in their own wing.

Many mid- and late-19th century billiard rooms were designed in extravagantly oriental, especially Moorish styles. This trend no doubt arose in part from the freedom of these styles from classical conventions – as Playfair's Egyptian design in 1793 had suggested; in part from their links with ways of life that to Western eyes appeared refreshingly outré; and in part from a straightforward delight in the exotic. An early “sultan's den” type of billiard room was laid out at Breadsall Priory, Derbyshire, for the hosier Francis Morley, by Robert Scrivener from 1861. Matthew Digby Wyatt produced a design in 1864 for 12 Kensington Palace Gardens, London, for the cotton magnate Alexander Collie. James Boucher's design for a mansion at 998 Great Western Road, Glasgow (1870s), included an “exotic” billiard room with walls of painted and gilded embossed leather. The Islamic styles spread to billiard

rooms in America, an example being that in Mark Twain's house (1874), Hartford, Connecticut, where the walls were decorated with quasi-Moorish stencilled patterns.

In 1884 a fine "Indian" billiard room was created at Bagshot Park, Surrey, by John Lockwood Kipling for the Duke and Duchess of Connaught. Designer and clients all had intimate experience of India, and in addition to a "Hindoo" billiard-table that was constructed in London, a special authenticity was conveyed on the walls by 241 elaborate wood-carvings made at Lahore between 1885 and 1887 by Punjabi craftsmen.

One of the most delightful billiard rooms (now destroyed) to come from the period was at Newhouse Park, St. Albans (1883), designed by Silvester Capes. The room was recorded by Bedford Lemere in 1897, probably soon after its completion. A standard six-light fitting hangs over the table, fulfilling the unique requirement of the billiard room to have its main artificial lighting very low in the space. The room is decorated in a riot of idiosyncratic Moorish-style flat patterns on textiles and wood, and includes much fretted cresting and infilling; compartmentalised walls incorporate raised alcoves with cushioned sofas for spectators.

The artistic ingenuity and elaboration of examples such as Newhouse Park suggest that the late 19th and early 20th century represented the billiard room's heyday. After World War I the table might well find a place of consequence in a man's sitting room, but, increasingly the sexes were mixing for other types of recreation, notably bridge. The move towards smaller, more compact forms of housing also meant that there was often no longer the space available to accommodate the game. Today, the playing of billiards, or snooker, is most often restricted to sports hall and clubs.

Bing, Siegfried 1838-1905

Naturalized French art dealer, publisher, entrepreneur and collector

Siegfried Bing (known as S. and mistakenly called Samuel) started his career in the arts as a ceramic manufacturer in Paris in the mid-1850s. He received a medal at the 1867 World's Fair, and a few examples of the pieces he produced can be found at the Adrien Dubouché Museum in Limoges. Following the Franco-Prussian War, Bing became an art dealer who specialized in the art of the Far East, and especially the art of Japan. His first shop, at 19 rue Chauchat, opened in time for the 1878 Paris World's Fair where Japan was extremely well represented. By the 1880s, after an extended trip to Japan, and as the demand for oriental art objects had turned into a craze known as *Japonisme*, Bing increased the scope of his business by opening several other shops that sold both modern and ancient Japanese arts and crafts. Between 1888 and 1891 Bing also published a magazine dedicated to the art of Japan, *Artistic Japan* (published simultaneously in French, English and German), and organized a series of Japanese art exhibitions which featured ceramics, paintings, and especially *ukiyo-e* prints. His shops became the mecca where many of the great collections of oriental art were formed (e.g., those of the Goncourt brothers, Philippe Burty, Henri Vever, Charles Haviland). And a passionate collector himself, Bing amassed an extraordinary collection which became a meeting ground for many of the *Japonistes*. It was totally dispersed after Bing's death in 1905.

By 1894, Bing had realized that his Japanese art business was not going to fulfil all his creative instincts. After a trip to the United States, where he went on behalf of the French government to study the level of culture, and after visiting several major American cities, Bing published his findings in *La Culture artistique en Amérique* (1895). He was especially impressed by the decorative work created by the workshops of Louis Comfort Tiffany and the Rockwood ceramic works in Cincinnati. This trip across the United States fired Bing's latent interest in design, and inspired his continuing quest to find the best arts and crafts workshops capable of producing the art objects he envisioned selling in his newly founded design gallery (e.g., the firms of Grueby and Co. in Boston or Clement Heaton in Neuchâtel, Switzerland).

Following a second exploratory trip in 1895, this time to Belgium in the company of the art critic Julius Meier-Graefe where they met the well-known designer Henry van de Velde, Bing decided to redesign his former Oriental art gallery at 19 rue Chauchat / 22 rue de Provence, and turn it into an emporium of modern design. The "new" gallery christened "L'Art Nouveau" opened in December 1895, and the exhibition became known as the "first Salon of Art Nouveau". The controversial exhibition was openly criticized in numerous

Bing: interior of room by Eugène Gaillard for the Art Nouveau Bing pavilion at the 1900 Paris Exposition Universelle, showing murals by José Maria Sert

articles in the daily French press for its support of a roster of foreign artists. This xenophobic sentiment was exacerbated by anti-semitic feelings which were always rampant, and had been made more acute by the Dreyfus "affair". Only a few advocates of Modernism came to Bing's support. Sympathetic critics and designers recognized that Bing commissions for entire room ensembles, such as those given to Belgian artists Henry van de Velde and George Lemmen, were the wave of the future. These interiors, along with stained glass windows, commissioned from the Nabis (including Edouard Vuillard, Paul Ranson, Pierre Bonnard, H.G. Ibels, Félix Vallotton, and Henri Toulouse-Lautrec) and executed by Tiffany in America, were installed in Bing's Art Nouveau gallery. *Papa Chrisanthème* by Toulouse-Lautrec (now housed at the Musée d'Orsay, Paris), was set above the entrance at 19 rue Chauchat.

This relationship with the firm of Tiffany in America was only one example of Bing's cooperative efforts with other design workshops in Europe and America, but it is special because it is the first time Bing forged an alliance with a designer and his craftsmen who created a group of objects under his entrepreneurial guidance. It was also a harbinger of Bing's foray into creative design after he opened his own ateliers in the same building as his gallery in 1898. Participants in the 1895 Art Nouveau Salon (which included painters,

printmakers, glassmakers, jewellers, etc.) found Bing's exhibition challenging since it placed foreign artists alongside French ones. The 1895 Salon, which had expanded on the idea first tried in Brussels at the "Maison d'Art", demonstrated that all the arts were equally helping to professionalize the new field of interior design. Subsequent small exhibitions organized by Bing at his gallery were "one-man shows" of some of the artists who had been chosen for the first Salon of Art Nouveau. These included paintings, prints and design exhibitions. The show of paintings and prints by Edvard Munch (1896) did much to galvanize the avant-garde behind Bing while at the same time it alienated conservative painters and critics in France (as explained by Arne Eggum, "Munch tente de conquérir Paris, 1896-1900", in *Munch et la France*, Paris: Editions de la Réunion des Musées Nationaux, 1991, pp.199-203).

At the close of the 1890s, Bing's success as a tastemaker – albeit as a passive tastemaker since he was not in control of the design of the objects he exhibited – was further enhanced by his move from selling objects designed by others (fabrics and wallpapers by William Morris, metalwork by the English arts and crafts designer W.A.S. Benson or glass work by Tiffany) toward the production of pieces or total room ensembles by designers and artisans working in his own workshops. By

1898–99, Bing had renovated unused space at the back of his gallery on rue de Provence and rue Chauchat. He created *ateliers* where artisans fashioned furniture, other interior design objects, and jewellery from designs produced by a group of designers who worked on commission essentially for Bing. Bing's ultimate success among devotees of design reform climaxed with the construction and opening of his own pavilion: Art Nouveau Bing, at the Paris World's Fair of 1900. This building, constructed from the architectural design of André Arfvidson, and financed solely by Bing, incorporated modern room environments created by three of the major designers in his employ: Georges de Feure, Edward Colonna, and Eugène Gaillard. Although there was little press coverage in France and few pieces of furniture or entire room interiors seem to have sold in France, the rooms excited comment throughout the world and pieces sold to private collectors in Sweden and decorative arts museums in Copenhagen and Hamburg where they could be studied by young craftsmen. The First International Exhibition of Decorative Design in Turin (1902) was the last major design exhibition to which Bing contributed. Examples of his ceramics designed by de Feure and Colonna and executed by the firm of Gérard, Dufraisieux and Abbot (GDA) in Limoges were recognized. Bing received a prestigious "achievement" award, but the *Art Nouveau Bing* style had already been surpassed by the more angular and more modern style which ended in the Art Deco movement.

Two years later, in 1904, Bing sold his gallery and auctioned his Art Nouveau pieces. By 1905, worn out from years as a dealer, and with the oriental side of his business in the hands of his son Marcel (who was also a talented jeweller and had been in charge of the jewellery atelier at his father's gallery) Bing died. The sale of his private oriental art collection was held in Paris, 1906, bringing estimable prices and further adding to the prestige of Bing's connoisseurship. The Art Nouveau side of Bing's entrepreneurial achievements languished until the recent examination of the Art Nouveau period demonstrated his vital significance as a promoter and tastemaker.

Biography

Born in Hamburg, 1838. Worked in a ceramics factory, Paris, mid-1850s; opened an oriental warehouse, Paris, 1877; travelled to China and Japan, 1880; visited America, 1884. Visited Belgium where he met Julius Meier-Graefe and Henry van de Velde, 1895; returned to Paris and opened L'Art Nouveau, 1895, selling furnishings by French, Belgian, English and American designers; established his own studio and workshops for the production of furniture, furnishings and jewellery, 1898. Had his own pavilion at the Paris Exposition Universelle, 1900; exhibited again at Turin, 1902. Published several important works on Japonisme and Art Nouveau. Oriental side of the business taken over by his son Marcel, and L'Art Nouveau sold, 1904. Died in Paris, 1905; his collection of oriental art was sold in Paris, 1906.

Selected Works

Bing material, including the store's private catalogue that recorded all the available items and prices post-1900, and known as the Album

de références de l'Art Nouveau, is in the Musée des Arts Décoratifs, Paris.

Blondel, Jacques-François 1705–1774

French architect and architectural theorist

Born in Rouen into a family of architects, Jacques-François Blondel was a key figure in the history of French mid-18th century design and taste. His work as an architect was limited to only a few commissions executed in Paris, Metz and Strasbourg. But as a professor of architecture he trained many of the leading Neo-Classical architects of the third quarter of the century including Etienne Louis Boullée, Claude-Nicolas Ledoux and Charles de Wailly, and his many publications,

which included numerous plates drawn and engraved by Blondel himself, were enormously influential in explaining how to plan and decorate a modern building. The two activities of writing and teaching were closely intertwined. Publications such as *De la Distribution des Maisons de Plaisance* (1737), *Architecture Française* (1752–56), *Cours d'Architecture* (1771–72), and nearly 500 articles written for Diderot's *Encyclopédie*, announced or reflected subjects on which Blondel lectured at the École des Arts, the private architectural school that he opened in 1740, the Académie Royale d'Architecture where he taught after 1762, and in the short courses he offered to gentlemen (*cours élémentaires*), designers (*cours de théorie*) and craftsmen (*cours de pratique*) from 1754. Many of these subjects were also closely linked to interior decoration and design and he devoted much space to the discussion of features such as doors, windows, chimneypieces, ceilings, floors, principal pieces of furniture and the distribution and planning of rooms.

Blondel's lessons combined the traditional and the innovative. No iconoclast, Blondel usually began his public courses and texts by discussing the proportions and characters of the Orders, which he considered basic to the practice of architecture. He also respected Vitruvius, Palladio, and Scamozzi, whom he called "the Ancients," integrating their theories of proportion into his guidelines for composing both façades and spaces. On the other hand, *Maisons* reveals Blondel to be the first French architect to treat the pleasure pavilion as a building type worthy of sustained attention, to develop new room types (dining room, bath), and to promote new technology (flush toilets). What most distinguishes Blondel from his peers, however, was his conviction that the architect could influence the daily operation of a household; that it was proper for him to do so; and that, to do this well, he had to uncover the range of factors affecting the client, particularly the client's activities and those of his entourage. His approach embodies the essence, if not all the techniques, of what we now call design programming; and in his insistence that spaces be planned so that their users may move and function efficiently, he is entirely modern.

Blondel first treated interior decoration in Part II of *Maisons*, offering advice about each of the various parts of the dwelling in turn. The emphasis was on the building as a whole, however, not only because "architecture must always be superior to ornament" but because, as he said later, quoting Horace, "the fundamental principle of all the arts is unity" (*Cours*, vol. 3). To achieve this quality, Blondel counselled an interdependence of hierarchy (focus on architectural elements; build to a decorative crescendo), harmony (reflect a room's purpose in its decoration, its character and function with materials), and balance (temper symmetry with common sense). Proportion was highly important, not only as it contributed to hierarchy, but in the guide it offered (via the Ancients) for determining ratios of length to width to height for rooms and architectural elements. The principle of contrast, on the other hand, was not in his lexicon. Rocaille was used to ease the corners of panelling, the line of furnishings, and the pattern of locks and ironwork, but its free curves were never allowed to dominate the spaces and objects Blondel created or applauded. (Several of his contemporaries – Pierre Patte chief among them

– credited his conservatism with returning French design to its classical roots.)

In *Architecture Française*, Blondel reiterated these views, and reproached those who ignored function and thought to develop beautiful plans by giving the rooms different shapes and arranging them symmetrically to right and left. After discussing room types and offering guidelines for their embellishment, he noted that the problems of layout tested the experience, intelligence, resources, and genius of an architect – the best decoration could not redeem inconvenience. General principles for interior spaces were recapitulated in the *Cours*: there should be reasonable variety in the shapes of the various rooms, a proportional relationship between height and width, a rational relationship of inside to outside. The interior treatment should reflect the status of the owner; spaces had to be convenient and suited to purpose; natural light should enter a library or gallery from high-placed windows, an *enfilade* should be side-lit by a rhythmic arrangement of tall windows.

Clients were at the heart of Blondel's approach. Layouts were to support their lifestyles. Room types – including the new bathrooms and toilets – were to increase their comfort. Decoration reflected their role in society. Servants were also clients of a sort, and the architect had to find ways to make their work more efficient (such as the uni-directional staircases proposed in *Maisons* to facilitate the serving and clearing of meals). The article "Cheminée" in the *Encyclopédie* used ratios to plan the height of a fireplace opening, but the height had both to obey the rules of proportion and allow those clustered around the fire to observe not only themselves but others elsewhere in the room. The principles which underlie Blondel's approach have lost little of their currency.

REED BENHAMOU

Biography

Born in Rouen, 8 January 1705, the son of the architect Jean François Blondel (1681–1756). Studied architecture under his uncle, François Blondel II (1683–1748); and later with Gilles-Marie Oppenord (1672–1742). Married 1) Marie Anne Garnier, 1729 (died 1755); two children including the engraver Georges François Blondel; 2) Marie Madeleine Balletti: son, the architect Jean Baptiste Blondel. Active as an architect in Paris by 1729. Established the École des Arts, an independent school of architecture, Paris, 1740. Member, Académie Royale d'Architecture, 1755; appointed professor, 1762. Practised as an architect in Metz, 1764–76. Author of numerous books on architecture from the 1730s, including the influential *Cours d'Architecture*, 1771–77. Died in Paris 9 January 1774.

Boffrand, Germain 1667–1754

French architect and designer of interiors

Germain Boffrand played a significant role in the development of French architecture and interior decoration during the first half of the 18th century. His designs incorporated aspects of 17th-century French classicism and Italian Baroque, responded

to the Rococo style of 18th-century Versailles and Paris, and ultimately contributed to the emergence of Neo-Classicism in France around the middle of the 18th century. His works were produced for noble and princely patrons in Paris, Lorraine and Germany, and included interior renovations, hôtels, pleasure pavilions and châteaux.

Boffrand often employed non-rectangular volumes, particularly ovals and circles, to create emphasis in a plan and a sense of continuity within a room. The Hôtel Amelot in Paris (1712–14) incorporated an oval entrance court, a trapezoidal vestibule flanked by two pentagonal spaces, and a projecting salon that carried this spatial dynamism through to the garden façade. The hunting lodge of Bouchefort near Brussels (1704–06), built for Max Emanuel of Bavaria, had an octagonal plan centered on a round, double-height salon articulated by two superimposed arcades. In two projects for La Malgrange (1712–17), a château near Nancy for Léopold, Duc de Lorraine, arcaded salons again dominated his designs, especially in the second version where a vast circular space marked the center of an X-shaped plan.

In the decoration of rooms, Boffrand sought a controlled dynamism in which the decorative articulation never dominated the architectonic conception. In the salon of the Hôtel d'Argenton in Paris (1704–05), built for one client and renovated around 1726 for another, a series of arches enframed the windows, doors, and mirrors, and the wall panels were punctuated with cartouches that enlivened but did not disrupt the regularity of the space. In a salon at the Petit Luxembourg in Paris (1709–11), redecorated for Anne de Bavière, princesse de Condé, Boffrand rounded the corners of the rectangular room, minimized the cornice, used the arcade motif rhythmically to unite doors, windows, and mirrors, and embellished the wall panels with delicate but strongly geometric patterns of gilded grotesque ornament.

Many of the devices explored in Boffrand's early work were reinterpreted in his most famous interior design, the Hôtel de Soubise in Paris. In 1732 Prince de Rohan commissioned Boffrand to renovate the hôtel on the occasion of his marriage to Marie-Sophie de Courcillon. The building had been substantially redesigned in 1705–09 by Pierre-Alexis Delamair, who provided a colonnaded entrance court and established a series of formal rooms arranged *enfilade* (with doors aligned on an axis). Boffrand's renovation, executed in 1735–39, both perpetuated a tradition of princely grandeur and met the standards of modern domestic distribution and decoration.

Boffrand designed two richly decorated *appartements de parade* (suites of formal reception rooms), one for the prince on the ground floor and one for the princesse directly above it. Each apartment culminated in an oval salon, located in a projecting, pavilion-like volume that Boffrand added to the corner of the building's garden façade. Boffrand also expanded and redecorated the less formal but equally elegant private living quarters adjacent to the grand apartments, in accordance with the functional specialization, convenience and intimacy that characterized 18th-century domestic planning. The new plans of the Hôtel de Soubise were published by Jacques-François Blondel in his 1752 edition of *Architecture Française*, and ten interior views were published by Boffrand himself in his 1745 *Livre d'architecture*.

The decoration of the Hôtel de Soubise incorporated work

Boffrand: oval salon, Hôtel de Soubise, Paris, 1705–09

by some of the most accomplished artists of the period, including the sculptor Jacques Verberckt and the painters François Boucher, Charles Natoire, Jean Restout, Charles Trémolières, and Carle van Loo. The decorative idiom of the apartments is Rococo, but Boffrand employed this light, lyrical vocabulary of curves, shells, foliage and dynamically shaped frames in a manner informed by both Baroque monumentality and cohesion and classical principles of regularity and harmonic proportion.

In the apartment of the prince, the *chambre de parade* (formal bedroom for receiving visitors), includes a bed niche set off by columns and pilasters, figured wall medallions invoking noble values such as wisdom and truth, and paintings of the loves of the gods. In the oval salon, eight arches rhythmically encircle the room and enframe the doors, windows, and mirrors. The spandrels between these arches contain white plaster bas reliefs by Lambert-Sigisbert Adam and Jean-Baptiste II Lemoine depicting personifications of various princely concerns, including poetry, music, justice, and astronomy. This apartment privileges tectonic form over opulent surface: gilding is used sparingly, painting is absent from the salon, and walls remain distinct from ceilings despite the rich mouldings that link them.

In the apartment of the princesse, gilding is used more extensively, the interplay of media and forms is more complex, and the program is focused more exclusively on the theme of love. In the *chambre de parade*, the loves of the gods are depicted in gilded wall medallions, in gilded cartouches in the corners of the ceiling cove, and by pairs of stucco figures perched at intervals upon the cornice. The oval salon in this apartment is probably the most famous of all 18th-century French interiors. As in the salon of the prince, eight arches enclose the doors, windows, and mirrors. But here the distinction between walls and ceiling is far more ambiguous: the arches are surmounted by gilded cartouches, which connect the arcade to a broad, undulating band of gilded openwork that encircles the room at cornice level. This band is punctuated above the cartouches by pairs of white stucco putti, and is connected by eight strips of gilded openwork to a gilded rosette in the center of the domed, sky-blue ceiling. In the spandrels between the arches, supported by pairs of gilded putti, are eight paintings by Charles Natoire depicting the story of Cupid and Psyche. In this room, Boffrand mobilized the arts of architecture, sculpture, and painting – as well as the dazzling visual and spatial effects of abundant mirrors, glass, and gilding – to create a very complex yet utterly coherent ensemble.

In the Hôtel de Soubise, as in all Boffrand's interiors, the architectural organization of space is discernible beneath the surface effects of ornament. The rooms are monumental in conception if not palatial in scale, and Boffrand used symmetry, rhythmic regularity, and contrasting colors and materials to maintain a visual and spatial clarity that was deliberately dissolved in the far more asymmetrical and atectonic schemes of such Rococo masters as Nicolas Pineau and Juste-Aurèle Meissonnier. Indeed, Boffrand participated in the criticism of the Rococo that began to pervade art and architectural theory in the 1740s. In his *Livre d'architecture* (1745), he condemned contemporary interiors as illogically composed, excessively luxurious spaces, tastelessly stuffed with fashionable bibelots. Many writers who similarly considered Rococo decoration to

be a threat to the structural and aesthetic principles of good architecture, such as Jacques-François Blondel and Pierre Patte, praised Boffrand's buildings as paradigms of principled design.

Boffrand's work was governed by the classical concept of *convenance*, the stipulation that every aspect of a building be appropriate to its location, its usage, and the social status of its occupants. For Boffrand, a house was a manifestation of personality: "One can judge the character of the master of the house ... by the manner in which it is disposed, ornamented, and furnished" (*Livre d'architecture*, p.12). Boffrand's designs were portraits of his elite patrons, for both the interiors and their owners sought to fuse tradition and modernity, opulence and restraint, elegance and power.

Biography

Born in Nantes, 16 May 1667, the son of the architect-sculptor Jean Boffrand. Moved to Paris, 1681, and studied sculpture under François Girardon and architecture under Jules Hardouin-Mansart (1646–1708). Married Marie Leneveu de Beauval (died 1730): two sons and two daughters. Employed in the service of the Bâtiments du Roi, Paris, 1686–99; appointed curator of the royal archives, 1690. Active as an architect in Paris and Nancy from c.1700. Travelled to Belgium in the service of the Elector Max II Emanuel of Bavaria, 1705. Member, Académie Royale d'Architecture (first class), 1709. Appointed Premier Architecte to the Duc de Lorraine, 1711. Re-employed by the Bâtiments du Roi, Paris; served as Architecte de l'Arsenal and Architecte du Palais de Justice, 1712. Financial ruin following the collapse of the Banque Royale de Law, Paris, 1720. Active as an administrator and involved in several urban development schemes from 1720; appointed architect and director, Hôpital Général, Paris, 1724; joined the Department Ponts des Chaussées, 1732, appointed Premier Ingénieur, 1742, and Inspecteur Général, 1743. Died in Paris, 18 March 1754.

Selected Works

A full list of Boffrand's architectural projects and decorative commissions appears in Gallet and Garms 1986. Examples of Boffrand's designs and architectural drawings are in the Archives Nationales, and the Bibliothèque Historique de la Ville de Paris, Paris, the Musée Historique Lorrain, Nancy, the Kunstbibliothek, Berlin, and the University Library, Würzburg. Boffrand's Hôtel de Soubise is now occupied by the Archives Nationales; the Cabinet Vert from it is now installed in the Hôtel de Rohan, Paris.

Interiors

- 1704–05 Hôtel d'Argenton, Paris (building and interiors; redecoration of the salon, 1726)
- 1704–06 Hunting Lodge, Bouchefort, near Brussels (building and interiors): Elector Max II Emanuel of Bavaria
- 1707 Hôtel de Mayenne, Paris (remodelling interiors and decoration)
- 1708 Hôtel de Canillac, Paris (additions and interiors)
- 1709–11 Petit Luxembourg, Paris (building and interiors)
- 1709–22 Château de Lunéville, Lorraine (building and interiors; reconstruction and new chapel, 1719): Léopold, Duc de Lorraine
- 1712–14 Hôtel Amelot, Paris (building and interiors)
- 1712–14 Hôtel du Premier Président, Palais de Justice, Paris (renovation and interiors)
- 1712–17 La Malgrange, near Nancy (building and interiors): Léopold, Duc de Lorraine
- 1713 Hôtel de Seignelay, Paris (building and interiors)

- 1713 Maison de Elector of Bavaria, Saint Cloud (decoration): Elector Max II Emanuel of Bavaria
- 1714–17 Maison du Prince de Rohan, Saint-Ouen, near Paris (building and interiors)
- 1715–22 Palais Ducal, Nancy (building and interiors, including the Grand Salon)
- c.1715–22 Arsenal, Paris (additions and interiors, including the Salon)
- c.1716 Hôtel de Villars, Paris (decoration of the Salon)
- 1723 Palais de Justice, Paris (decoration of the Grand Chambre)
- 1729 Pavilion of the Duchess of Maine, Arsenal, Paris (building and interiors)
- 1735–39 Hôtel de Soubise, Paris (oval salons and decoration of the prince and princess's apartments): Prince de Rohan

Boiseries

The term *boiseries* derives from *boiser*, the act of lining architectural surfaces with wood. Properly speaking, it includes any wood-paneled interior surface, whether ceiling, wall, or floor, but through convention it has become a synonym for vertical paneling. It is particularly associated with French carved and gilded paneling of the Louis XV and XVI periods but it is also used to refer to imitations of these styles in other countries such as the white and gilt saloon installed at Uppark, Sussex, in the early 1770s.

Made by *menuisiers en bâtiments* (members of the wood-workers' guild specializing in small-scale construction), *boiseries* consisted of flat panels (known as the field) held in place by tongue-in-groove framing of vertical (stiles) and horizontal (rails) units. Mounted on battens, they created a space between the wall and the wall treatment that both protected the wood from contact with damp masonry or caustic plaster, and provided recesses where valuables could be secreted in troubled times. Their method of construction and installation also allowed them to be demounted and reassembled. This portability has proved extremely helpful to modern museum curators intent on recreating period rooms, but it was also a useful feature in earlier times: provincial buyers frequently ordered their *boiseries* from Paris; and Parisians offered *boiseries* for re-sale. The advertisement of "72 feet of *boiseries*, 15 feet high, painted in arabesques by Watteau" carried by the *Annonces, affiches et avis divers* in July 1784 was not unusual.

Before the intervention of technology, paneling represented a material response to climate. In the France of the Middle Ages (as in England and across northern Europe), the insulating properties of wood mediated the cold and damp that could radiate from masonry walls, and enhanced the heat provided by primitive hearths and fireplaces. Practicality did not preclude embellishment, however; and the short, narrow panel fields of medieval *boiseries* generally carried geometric ornament and family crests, painted in bright colors and hung with tapestries. During the Renaissance period, improvements in fireplace construction and glazing lessened the importance of *boiseries* as insulation; advances in milling technology resulted in longer and wider panels; and evolution in the subjects and techniques of art led to more sophisticated designs. As in contemporary Italy, some French paneling was executed in pictorial marquetry; but the more important paradigm was the Italian integration of architecture, furnishings, and artwork seen in galleries at Fontainebleau begun by Rosso Fiorentino for François I and completed under Philibert de L'Orme and Francesco Primaticcio for Henri II (restored under Louis-Philippe in the 19th century).

By the middle of the 17th century, most walls were at least partially, and more often fully paneled; and French *boiseries* had assumed the character they would maintain, despite variations in detail, until the end of the Ancien Régime. This comprised a low dado surmounted by tall panels, usually

extending to the cornice, but sometimes capped by a low attic or merged into a cove. The total height was generally around 5 meters. The prevailing shape was orthogonal: the asymmetric and freehand curves introduced during the Rococo period were never allowed to dominate the composition, and vanished when the country returned to classical prototypes around 1760.

In general, *boiseries* were modeled on architectural features and featured alternating wide and narrow widths. In classical styles, the narrow widths were often transformed into pilasters. The rhythmic arrangement, which spread symmetrically from centered fireplaces and accommodated windows and major passageways, was reinforced by building consoles at dado height and by disguising secondary entrances into rooms (as in the Queen's Cabinet Doré, Versailles). The dado was retained even during the curvilinear Rococo: its cap served the practical purpose of keeping furnishings away from the wall, and its height ensured that any decoration of the panel fields would be fully visible.

The character of the decoration reflected prevailing fashions or taste, the purpose of the room, and the financial resources of the owner. The simplest *boiseries* were of natural wood – typically, oak, fruitwood, walnut, or pine – finished with varnish. In the 18th century they were usually painted white, although pastel greens, pinks, and yellows became popular after 1730. Mouldings and ornament were often painted a contrasting colour or a lighter value of the panel hue. Both were also often gilded in grand rooms.

The panels were embellished in a variety of ways. Grandly-scaled ornament – trophées, cartouches, and heavy mouldings – were used in public rooms such as Louis XIV's *Chambres de Parade* at Versailles. Emblematic motifs, like musical instruments were a frequent device in music rooms. Small-scale arabesques, *singeries*, and *Chinoiseries* – executed in paint or lacquer – were popular for more intimate settings such as salons, cabinets, bathrooms, and boudoirs. At a time when artists were often closely involved in interior decoration, these decorations could be executed by a Christophe Huet (Hôtel de Rohan, 1735) or a François Boucher (whose *singerie* painted for Madame de Pompadour has disappeared). Other artists produced canvases to a size demanded by the *boiseries* (for example, Jean-Honoré Fragonard's *Progress of Love*, painted for Mme. Du Barry's pavilion at Louveciennes, now in the Frick Museum, New York). Overmantels, overdoors, and mirrored panels extended the decorative theme. *Boiseries* were also overlaid with gilded carving, as can be seen in the work executed throughout Versailles (Chambre de la Pendule, Mme. Adelaide's Music Room, Mme. Adelaide's Bath, etc.) by Antoine Rousseau and the Flemish *ornemaniste* Jacques Verberckt to the designs of Ange-Jacques Gabriel. Such work paid well; Verberckt received some 50,000 livres in 1735–36 alone.

The popularity of coloured *boiseries* led to the development of new techniques and formulae. The simplest approach to single-colour panels was a coat of whiting, polished and top-coated with the desired hue. For a more durable finish, the wood was prepared with two coats of hot glue and up to seven coats of whiting tinted with a little Prussian blue. The last coat of whiting was sanded with pumice before the oil-based colour was applied. For important installations, Ange-Jacques Gabriel

specified a “chipolin” of multiple coats of whiting, colour, glue, and varnish. Lacquerwork required even more painstaking and time-consuming techniques. That each of these materials had its own unpleasant odour is suggested by the applause which greeted the “odourless” paint developed by vernisseur Dandrillon by the *Année littéraire* (1757–58). Called an “impression à la Grecque”, this paint was probably similar to the encaustic (wax-based compound in which colours were fused with heat) attributed to Théodon Odier and used by Gabriel at Choisy. Other “odourless” paints and stains were developed by Jean-Félix Watin, author of *L'Art du peintre, doreur, vernisseur* (2nd edition, 1772).

By the last quarter of the 18th century, when entrepreneurs and inventors were creating a number of artificial products (including simulated marbles and building stones), the intricate ornament that had earlier required the skill of carvers like Verberckt could be imitated with a compound of parchment, gum arabic, gum dragon, water, and sawdust. Boiled to the consistency of oatmeal, this plastic wood was cast in moulds, attached to paneling with glue or screws, and painted (*Almanach sous verre*, 1780). In England, *boiseries* had long been imitated in stucco, or even papier-mâché as can be seen in the decoration of the saloon at Hartlebury Castle, Worcestershire, of c.1760. Concurrently, traditional *boiseries* fell from favour. Panels could be simulated with mouldings attached directly to the wall, and wallpaper, fabric, and imitation marble substituted for the panel field. The Empire period reduced paneling to a low dado, at best; and while the glories of earlier *boiseries* appeared to return with the Restoration, the old techniques of construction and decoration had vanished. However, *boiseries* enjoyed a brief revival during the last decades of the 19th century when interiors decorated in the Louis Quinze style became fashionable among a wealthy European and American clientele. These revivalist interiors included Baron Ferdinand de Rothschild's houses at Ferrières, near Paris, and Hamilton Place, London, which featured antique 18th-century French *boiseries*, and the châteauxesque townhouses and Newport “cottages” built by Richard M. Hunt and decorated with Rococo-style *boiseries* designed by Ogden Codman, Jr.

Bonomi, Joseph 1739-1808

Italian architect and designer of interiors

Joseph (christened Giuseppe) Bonomi was one of the most important of a small but distinguished group of Continental Neo-Classicalists who chose to settle in England, bringing a cosmopolitan sophistication which enlivened the native tradition, and playing a significant role in the Royal Academy and artistic life generally. His career in England of approximately forty years from 1767 spanned a period of rich variety and high achievement in English interior design, and Bonomi's own output reflects the full range of the fashionable alternatives: advanced Continental Neo-Classicism; the Greek Revival; the Adam Style; Pompeian. Despite this diversity, it would be a mistake to assume he was merely an adaptable follower of fashion; in all of them he developed his own personal idioms, sometimes displaying great originality and inventiveness. Bonomi is also important as one of the first architects in Britain to produce coloured interior perspective drawings of his designs, many of which gained prominence through their exhibition at the Royal Academy.

Bonomi was born in Rome and was educated at the Collegio Romano. He studied architecture with Antonio Asprucci and later with Marchese Teodoli. There is evidence to suggest he studied with Clérissieu too. He met James Adam while the latter was on his Grand Tour, and from 1763 he worked in Rome under contract for the Adam brothers, measuring antiquities and producing drawings for transmission to London. In 1767 they invited him to join their London office as one of a number of accomplished Italian draughtsmen on whom the firm relied for their finely worked presentation drawings. He remained with them until 1781 and a clause in his terms of employment precluded him from undertaking independent commissions during this part of his career.

Having had little success in launching a career in London, he returned to Italy in 1783. While there he became an associate of the Clementine Academy at Bologna and of the Academy of St. Luke in Rome. He also travelled in the South of Italy visiting Pompeii and Herculaneum, and the Greek temples at Paestum, all of which were to provide fruitful sources for his subsequent designs, and usefully augmented his experience of ancient remains in and around Rome. He found little employment in Italy, but it seems likely that among the English travellers he met there were several who offered employment prospects in their native country. Thus in 1784 he returned to London, although he continued to exercise contact with artistic developments in Italy via his friends and relatives, and he

appears to have entertained the desire eventually to secure a professional appointment and residence there.

One of Bonomi's major contributions to the interior designer's art was in helping to popularize the internal perspective drawing. Several of the finest of his own offerings in this genre were exhibited at the Royal Academy from 1783 onwards. Reynolds thought highly of him and in 1789 he was elected an associate of the Academy, on Reynolds's casting vote. The following year he tried unsuccessfully to gain full membership – having an eye on the vacant Professorship of Perspective – despite some influential support. Subsequently he made a number of other attempts to become a Royal Academician, all of which failed. Nevertheless, he continued to exhibit a series of outstanding drawings at their influential exhibitions.

There is a tradition that Bonomi was responsible for the interior perspectives which appeared in the Adams' *Works in Architecture* (vol.1 1773; vol.2 1779). There is no reason to doubt this as these illustrations have much in common with Bonomi's drawings of his own schemes. Significantly, they are quite different from the usual "folded down" elevations of a room's four walls which the firm usually used to depict its interior designs, or the sectional drawings used by many of the other leading British architects of this period. Bonomi's drawings recall the drama and strong chiaroscuro of Piranesi's illustrations, but they also share qualities with the virtuoso stage designs of the Bibiena family. Bonomi's internal perspectives helped found a tradition exploited so successfully by Sir John Soane and his assistants, and eventually adopted by many of the leading architects and interior designers of the 19th century.

The schemes depicted in Bonomi's interior drawings represent a highly individual and varied response to the current Neo-Classical taste. And while his exteriors were frequently severe to the point of ugliness, often he proposed sumptuous apartments behind them. Despite a working life spent almost entirely in England, always his work reflects his Italian training – and the avant-garde Neo-Classicism that evolved while he was a student – as well as his knowledge of that country's buildings, whether from antiquity, the Renaissance or post-Renaissance periods. Indeed, he was one of the few designers working in England before Soane who offered a serious alternative to the Adam style of interior.

Unsurprisingly, his early independent work is informed by his years in the Adams' office; for example, an unexecuted design for a dining room for Standish House, Lancashire of 1782, or the scheme for the Great Room of Montagu House, London of the late 1780s. But while he used many of their motifs, his work is more robust and avoids the brothers' fondness for distorting the proportions of the orders to the extent that they are reduced to mere decorative motifs. Another potent influence in his early interiors are the great baths of Imperial Rome. His tendency to specify vaulted ceilings springing from columns, domes and top lighting all draw unmistakably on this archaeological source, as is evident, for example, in his design for the gallery of an unidentified house, c.1782, and the design for the library of Lansdowne House, London, 1786.

Beginning in 1784, Bonomi spent several years completing the interiors of Packington Hall, Warwickshire, and building

Bonomi: design for Great Room for Mrs. Montagu, Portman Square, London, late 1780s

the church there. The patron was the 4th Earl of Aylesford, a gifted amateur architect who perhaps influenced the designs. Bonomi's work at the Hall included the Pompeian Gallery, executed in 1787, the largest and one of the earliest Pompeian schemes in England. A further variant on the Neo-Classical theme came in the interior of Packington church 1789–90. Here he combines thermal windows and a cross vault derived from Roman baths with squat Greek Doric columns – one of their earliest uses in England – and bare stone walls to produce a compelling and original interior. Greek references also appear in the entrance hall of Longford Hall, Shropshire, 1789–94, where the upper walls are decorated with casts of a Greek frieze, although the pedimented and columned screen to the staircase employs the Roman Doric order.

The drawings of Bonomi's schemes sometimes indicate a full complement of furniture as part of a carefully worked out architectural composition. In the unexecuted drawing room for Montagu House in London, c.1782, he specified familiar Adamesque motifs for sofas and oval mirrors which incorporate candelabra; for the Great Room of the same house, he designed a fitted carpet decorated in the manner of an antique

mosaic floor. A remarkable set of *klismos* chairs in the Pompeian Room at Packington – probably designed by Bonomi – based on painted scenes from Greek vases, pre-date Thomas Hope's popularization of this form.

No doubt on Bonomi's recommendation, interiors which he designed were often executed by Italian decorators, painters and craftsmen, further strengthening the Continental flavour of Bonomi's Neo-Classicism.

CHRISTOPHER WEBSTER

Biography

Born in Rome, 19 January 1739. Educated at the Collegio Romano, Rome, and studied architecture under Antonio Asprucci and Marchese Teodoli. Married Rosa Florini, a cousin of the painter Angelica Kauffman (1741–1807): 3 sons including Ignatius (an architect) and Joseph (an Egyptologist and curator of the Soane Museum). Active in Rome from 1763; moved to England to work as a draughtsman for the Adam brothers, 1767 (remained in their employment until 1781); afterwards, assisted the architect Thomas Leverton (1743–1824). Active as an independent architect from

c.1782; visited Italy, 1783; returned to England, 1784. Exhibited regularly at the Royal Academy of Arts, London, 1783–1806; elected an Associate, 1789. Associate of the Clementine Academy of Bologna, 1783; honorary architect to St. Peter's, Rome, 1804. Died in London, 9 March 1808.

Selected Works

An important collection of Bonomi's architectural designs, drawings and designs for interiors is in the Drawings Collection, Royal Institute of British Architects, London. A full list of his architectural commissions appears in Colvin 1995.

Interiors

- c.1785–88 Packington Hall, Warwickshire (interiors, decoration and some furniture, including Pompeian Gallery): 4th Earl of Aylesford
- 1786 Lansdowne House, Berkeley Square, London (unexecuted designs for a library): William Petty, 1st Marquis of Lansdowne
- 1789 Townley Hall, Lancashire (unexecuted designs for a sculpture gallery): Charles Townley
- 1789–94 Longford Hall, Shropshire (building and interiors): Ralph Leeke
- c.1790 Montagu (later Portman) House, Portman Square, London (ballroom): Mrs. Montagu
- 1793–1800 Eastwell Park, Kent (building and interiors): George Finch Hatton
- 1796–97 Lambton Hall, Co. Durham (interiors including library, dining room and picture gallery): William Lambton

Bookcases

The storage arrangements for books was generally of little consequence until such time as there was a growth in book ownership. Book storage in the early period was crude but effective. Byzantine images show books stored flat on their sides in cupboards with solid doors. In monasteries and seats of learning, the storage of books was in specially designed

fixtures, often with the volumes chained to them. For protection these open shelves were sometimes covered with a curtain. By the 16th century, the idea of a revolving bookcase or reading machine, was one response to a developing interest in reading and books, although it was still more common to store books in a secure chest.

By the 17th century, the growth in private book collections meant that there was a strong demand for proper storage facilities for books in a domestic environment. Free-standing bookcases were a response to this new need. These bookcases were based on a pattern that had a closed cupboard below surmounted with an open cupboard fitted with glazed doors. In this way the contents were on view, but protected and organised. On occasions when books were in use, or for ease of access in small rooms, wall-hanging shelves were introduced.

The end of the 17th century also saw a range of built-in bookcases which furnished the room in a particular architectural style. Examples exist of Daniel Marot's designs for a library in Holland which show plans for the careful integration of bookcases. In Italy architecturally detailed built-in bookcases were also introduced into private houses, while French architects were planning interiors with panelled walls, often incorporating bookshelves in parts of the scheme. If not built in, the *armoire-bibliothèque* with glazed doors was clearly designed for safeguarding books.

One of the most successful designs for book storage has been the bureau-bookcase. Simply put, it was a bureau desk with a bookcase surmounted upon it. This description belies the range of magnificent products of the late 17th and early 18th centuries. Initially made in walnut, the bookcase doors were usually either glazed or panelled. Although the bureau-bookcase was apparently first introduced in England, it soon found popularity in Holland, Italy and later on in America. This is not surprising as it was an extremely useful piece of domestic furniture, ideal for any location in a house.

In addition to the dual-purpose bureau-bookcases, the desire for free-standing architectural-style book cabinets developed. These were often decorated with fluted columns, pilasters, brackets and triangular or broken pediments: the Classical references indicating an association with learning. The use of fashionable mahogany timber meant that crisp carving and fine veneered finishes could be combined with glazed doors fitted with elegantly arranged bars to produce a powerful piece of furniture. The bookcases in Powderham Castle library supplied by the English cabinet-maker John Channon are extreme examples of the type.

The development of the wing or breakfront bookcase – a large bookcase with a central projection to house larger books with smaller sections on each side – seemed a natural progression. This style continued throughout the 18th century and has frequently been reproduced.

By the mid-18th century a gentleman's library might be too big to be stored in one or two bookcases, so the library room became more prominent. This room was specially fitted out with bookcases round much of the perimeter, and the design was often architecturally inspired to create a suitably studious atmosphere.

By Sheraton's time the fashionable bookcase had changed. They appeared to be narrower than previously with a higher

base section and variety in the detailing. Their delicacy perhaps indicated that they were for use in drawing rooms rather than the library, especially as Sheraton made much of the selection of designs for the door tracery in his Drawing Book. This may have been a rather minor part of the design but was clearly important to Sheraton. In the same vein he was also influential in the taste for incorporating busts onto the frames of bookcases.

The 19th-century bookstand, a set of low open bookshelves on a base often fitted with castors, was indicative of a trend. Generally designed to stand against the wall, there were versions with open backs, glazed doors or cupboards, some being on feet, others on plinths. The 19th century also revived revolving bookcases, one particular patented model with an upright columnar action having considerable success. The idea in many variations continued into the 20th century.

Not surprisingly, it was at the Great Exhibition held in London during 1851 that one of the most impressive bookcases was displayed. It was produced by Carl Leistler of Vienna as a gift for Queen Victoria, and its usefulness as a bookcase was secondary to its value as an extraordinary *tour de force* of craftsmanship.

The influence of the Arts and Crafts Movement meant that bookcase designs might look like miniature architectural models. Norman Shaw's painted secretaire bookcase shown in London's 1862 Exhibition is an example. On the other hand, neo-Gothic bookcases were often based on functional units with simple inlaid decoration. Examples by A. W. N. Pugin and Charles Bevan show this form.

In the 20th century book storage developed upon unitary lines, with a number of designs being made on a modular basis. The minimal bookcase was an open carcass fitted with shelves, which could be made to any scale. The Minty range of sectional bookcases was relatively popular, but other models based on European types such as Plan furniture were less so. The functional idea of the Modernists meant that general items designed for a variety of tasks were preferred to specific objects for particular tasks. In the second half of the 20th century storage systems were developed that would store books and other items on open shelves. These systems, many of which were developed in Scandinavia, were based on ladders and brackets supporting shelves and small cupboards, and were particularly suited to open-plan interiors. Although a common solution to book storage problems is to have units built-in, one innovative product that was especially designed for a specific range of books was the Isokon Penguin "donkey". A small plywood bookcase designed to stand next to a chair, it was scaled to fit paperback books, especially the Penguin range.

The choice of bookcases is now as wide as the variety of styles that might require them, from Memphis to Makepeace, reproduction to Ron Arad: bookcases remain as important a symbol as they ever were.

Borra, Giovanni Battista (Giambattista)

1713–1770

Italian architect and draughtsman, engineer, engraver and painter

Following his work as architectural artist and topographer for a British-led expedition to the Levant in 1750 and 1751, Piedmont-born Giovanni Battista Borra quickly achieved a high level of recognition in England. This recognition was far greater than that which he received in his native Italy and is still to some extent evident today. Approximately half of the 200 drawings of ancient sites and monuments that Borra made on this trip served as the basis for a series of engravings published by Robert Wood, *The Ruins of Palmyra* (1753) and *The Ruins of Balbec* (1757). Both of these volumes attracted great interest from lovers of the ancient world. Borra's drawings of the architectural ornaments of Palmyra, in particular, proved to be an ideal source of patterns for interiors designed in the advanced Neo-Classical taste and, on his return from the Levant, his skills as a decorator were much in demand by wealthy landowners and aristocrats. English clients were also attracted to Borra's work by his knowledge of the Piedmont Baroque and the French-influenced Rococo.

A ceiling ornament from the sun temple of Palmyra, reproduced in Plate XIX/B of the Palmyra book, soon became an extraordinarily popular quotation from antiquity. Two years previously Horace Walpole had discovered a ceiling in the State Bedroom at Woburn Abbey decorated with this very motif. It consisted of a large central rosette bordered by a meander band, lying in a rectangular frame made up of fields of octagonal coffers which in turn are decorated with rosettes. Numerous richly varied interpretations of this ceiling pattern appeared in the second half of the 18th century – the most famous being Robert Adam's ceiling at Osterley Park, Middlesex – and many were produced either under the direct guidance of Borra himself or were copied from his designs. In February 1755 Borra was commissioned to produce plans for the redecoration of the State Apartment at Stowe, the Buckinghamshire home of Richard Grenville, Lord Temple (1711–79), for whom Borra also made two new designs for the south front of the house and by whom he was consulted over the Neo-Classical remodelling of the garden architecture. Lord Temple wanted new designs for the bipartite ceiling and frieze in the State Bed Chamber, as well as new chimneypieces here and in the adjoining State Dressing Room. The coffered section of the bedroom ceiling once again includes a variation on the popular decorative motif from Palmyra. But, instead of positioning a large patera above the central point of the room, Lord Temple used this position to display the Order of the Garter which had been bestowed on him a short time before and which gave the room the name – Garter Room – that it still

bears today. As well as various antique-style ceiling decorations and architectural details, Borra was responsible for the design of the Baroque-style state bed which was in the form of a gilded baldachin and which was originally placed against the west wall of the room between Corinthian columns.

Borra's "Catholic Style" was much admired by aristocrats who championed the Tory cause, but he also attracted the patronage of the Duchess of Norfolk who was known to be a Jacobite sympathiser. The Duchess's husband, the 9th Duke of Norfolk, had chosen the Palladian architect Matthew Brettingham, a follower of Lord Burlington who was supported by the Protestant Whigs, to design his London house. And it was probably through Lord Temple, who was a friend of her husband, that the Duchess, whose taste dominated the interior decoration within Norfolk House, made contact with Borra. There was also an indirect connection with Piedmont through John Cuenot, a craftsman of French extraction who executed the wood-carvings and was possibly related to François Cuenot, who worked from 1660 for Carlo Emanuele II in Savoy as a sculptor and woodcarver. The music room of Norfolk House (demolished 1937 and reconstructed in the Victoria and Albert Museum) provides the best evidence of the house's exceptional interior decor which was developed chiefly from Borra's designs. The unusually free way in which different architectural and ornamental styles are combined is particularly striking, with English neo-Palladianism combined with Piedmont late Baroque and French Rococo.

The state rooms were reached via the central stairway whose skirtings on the first floor level were decorated in a rich, late Baroque style. They were finished with a stuccoed high relief in the form of trophy decorations hanging from large bows, a decoration which is reminiscent of Filippo Juvarra's wall decoration for the upper floor of the oval central room in the Stupinigi Hunting Lodge (1731), near Turin. On reaching the first floor, the visitor was led through a succession of magnificently decorated rooms. The plurality of styles – described by contemporaries as "whimsical" – reached its peak in the music room. Gilded wood-carvings in a French Rococo style decorate the alternately broad and narrow panelling and frame of the wall mirror above the marble fireplace (neither of the mirrors by Cuenot after Borra's design on the window side has been reconstructed). The formal plasticity of both the curved fireplace surround above its outwardly-turned supports, and the decorative elements such as the centrally-placed head of a woman – which appears to have derived from the work of the Baroque classicist Jean I Berain, and which is comparable to the wood-carved masks in the panelling as well as to the masks on the mirror frames and the head of Hermes on the fireplace in the former Green Damask Room – correspond neither to Baroque fireplace designs in Turin palaces nor to the latest trends in French Rococo design. The fireplace is still less indebted to English convention, and only the design of the ceiling in the Music Room can have been familiar to English visitors. The clearly-ordered Palladian ceiling decoration is readily identifiable as a variant of Inigo Jones's prototypical ceiling ornamentation in the Banqueting House at Whitehall, even though the geometrical fields of the ceiling are further decorated with Rococo cartouches of gilded stucco by the sculptor James Lovell with whom Borra had worked at Stowe.

In 1756, just a short while before his final return to Italy, Borra was commissioned to undertake alterations to the residence of Prince Ludovico di Carignano in Racconigi, near Turin. The early classical modification of Castello di Racconigi, which had been half completed following the Baroque plans of Guarino Guarini, also included the partial reworking of its interior design and its decoration. Borra's designs for the interior of the entrance hall (*Salone d'Ercole*) and its adjoining reception room (*Salone di Diana*) clearly demonstrate his knowledge of both antiquity and English neo-Palladianism. In stylistic harmony with the front entrance, the colonnade motif is taken up once again in the entrance hall in a neo-Palladian manner. A structure akin to a loggia, which reaches the bottom of the second floor, extends in front of the partition separating the two rooms, which lie one behind the other. This structure is formed by six free-standing Ionic columns which are arranged in pairs towards the centre and which support a passageway lined with balusters between the rooms to the sides. In contrast, the two walls which run the length of the entrance hall are structured and decorated in a late Baroque style. These walls rise up to the first floor and have alternate door openings with triangular pediments and niches with rounded pediments housing sculptures. The statues, modelled by the Lugano sculptor and stucco artist, Giuseppe Bolina, who was highly regarded in Piedmont, represent six of the twelve Labours of Hercules. The stucco war trophy mouldings above the niches closely resemble the forms on the staircase at Norfolk House.

With the fine stucco work that forms part of the interior of the neighbouring *Sala di Ricevimento* – also by Bolina – Borra looked back even more obviously to motifs that had proved their worth at Norfolk House. The overdoors above the entrance and the two pairs of side doors correspond to a large extent to the "monkey doors" of the Great Drawing Room that were carved by Cuenot. Only the main figurative motif, which had originally consisted of small, mischievous monkeys or Rococo *singerie*s, was replaced by garland-bearing putti in the *Sala di Diana*. By contrast, the four colossally large medallions can be linked to the decoration in the *Salle de la Guerre* at Versailles, commissioned by Louis XIV and carried out by Antoine Coysevox; this link can be substantiated by Prince Ludovico's family tie with the French royal household. The two facing fireplaces are in the style of Guarini or may have been by Guarini himself (Gabrielli, 1972). Unlike the Baroque and Rococo style of the wall decoration, Borra used an anti-Baroque, antique motif for the ceiling. Around the middle field with its bas-relief, he arranged an ornament of intersecting circles with inlaid rosettes, a design that matches exactly another ceiling pattern from Palmyra which Borra recorded in the *Ruins*.

The tension in Borra's work resides not so much in the fact that he was willing and able to use several different styles simultaneously, but more in the breadth of his education, and in the open-minded and wide-ranging nature of his interest in architecture and its history. The results of this interest reached a wide public after the middle decades of the 18th century, and Borra's influence – felt most notably in the emergence of Neo-Classicism – is attributable primarily to the success of his published drawings.

Biography

Born in Doglinai, Cuneo province, 27 December 1713. Trained under the architect Bernardo Vittone in Turin. Under Vittone's guidance, executed illustrations for Vignola's architectural treatise (unrealized), 1734, and drawings and prints for Vittone's *Istruzioni Elementari* (1760), c.1736. Studied at Turin University, graduated 1741. His practical manual, *Trattato della cognizione ...*, published 1748. Employed as architectural draughtsman by John Wood, James Dawkins and J. Bouverie on their archaeological expedition to the Levant, 1750–51. Returned to London in 1751, and provided the drawings for Wood's publications, *The Ruins of Palmyra* (1753) and the *Ruins of Balbec* (1757). Acquired several British patrons, including the Duke of Bedford, 1752, Richard Grenville, Lord Temple, 1752–55, and the 9th Duke and Duchess of Norfolk, 1755. Returned to Italy, 1756, and worked on interiors for the Castello di Racconigi, 1756–58. His designs were used for Palazzo Grassi (now Cocconito, Langosco), and Casale Monferrato (executed 1776). During the 1760s active as civil and sacred architect, and as engineer. Provided plans for the restoration of the fortifications of the citadel Alessandria, and hydraulic schemes. He died, probably in Turin, before 16 November 1770.

Selected Works

The most comprehensive collection of Borra's designs for interiors is in the library of the Society for the Promotion of Hellenic Studies, London, and in the Drawings Collection, Royal Institute of British Architects, London. 98 watercolours of the Levant are in the Mellon Collection, Center for Studies in British Art, Yale University. Borra's correspondence with Lord Temple is held at the Huntington Library, Santa Monica, and further manuscript sources are in the State and City archives, Turin. The Norfolk House Music Room is at the Victoria and Albert Museum.

Interiors

- 1740 Palazzo Isnardi di Caralgio, Turin (interiors with B. Alfieri)
- 1751 Woburn Abbey, Bedfordshire (interior decoration): Duke of Bedford
- 1752–55 Stowe, Buckinghamshire (State Apartment, State Bedchamber and Bed, State Dressing Room, Garter Room): Richard Grenville, Lord Temple
- 1755 Norfolk House, London (including Music Room): Duke and Duchess of Norfolk
- 1755 Stratfield Saye House, Hampshire (ceiling of dining room)
- 1756–58 Castello di Racconigi, near Turin (building and interiors including Salone d'Ercole, Salone di Diana, Sala di Ricevimento): Prince Ludovico di Carignano
- 1757 Palazzo Argentero di Bersezio, Perrone di San Marino, Turin (interiors)
- 1758 Palazzo di Città, Ivrea (building and interiors)
- 1760 Palazzo Turinetti di Pertengo, Turin (building and interiors)

Bossi, Antonio Giuseppe c.1700–1764

Italian stuccoist, sculptor and painter

Antonio Giuseppe Bossi was born in Porta Ceresio, near Lugano, at the beginning of the 18th century and came from a well-known family of Italian stuccoists. Trained as a sculptor and modeller, he also executed decorative paintings, frescoes and *scagliola*, and his work at the Würzburg Residenz in Germany includes some of the finest and most distinctive examples of stucco decoration in the High Rococo style.

In 1727–28 Bossi worked with Francesco and Antonio Quadri and Gina Battista Pedrozzi at the abbey of Ottebeuren, near Meuringen, producing elegant stucco decorations in the antechamber of the Imperial Hall, in the vestibules of various chapels and for the ceiling of the so-called Amigoni room. After this he moved to Magonga where it seems he came into contact with the older modeller Georg Hannicke, whose influence can be detected in much of the work that Bossi executed during the following years. Drawn to Würzburg by the work that was being undertaken in the Schönborn Chapel of the Cathedral, in 1733 he requested and was granted permission to join the team in charge of the decorations and was given the task of executing all the stucco work. He proved himself to be an artist of extraordinary skill and the Prince-Bishop Friedrich Carl von Schönborn appointed him court stuccoist at the end of the following year. Much of his activity over the next three decades was concentrated upon the decorations for the Würzburg Residenz where he worked, with only minor interruptions caused by ill-health, until just a few years before his death in 1764.

Bossi's work at the Residenz illustrates the full range of his stylistic development. In his earliest contributions, the impact of Northern Italian sculptural traditions, combined with

Bossi: Imperial Hall (Kaisersaal), Residenz, Würzburg, 1735–57

French and Viennese influences, are evident. His more mature works, however, reveal a more original language and the use of an unmistakably Rococo style. Moreover, always sensitive to the environmental and architectural characteristics of the spaces to be decorated, Bossi varied the distribution of the mass of ornament and the depth of the reliefs accordingly. His most important works, which also elicited the greatest praise from his contemporaries, were the ceiling of the Hall of Mirrors (1741), the Gallery (1743–44), the White Hall and the Main Staircase (from 1744), the hall facing the garden (1745) and the Imperial Hall (1750–51). The White Hall, or *Salle des Gardes* as it was also known, is a masterly example of Rococo decoration at its most delicate. The whole room is coloured in white and off-white, broken only by the subtle contrasts of the brown doors and grey-black stove. It is dominated by Bossi's exquisite stucco work which covers large sections of the ceiling and walls in a lacy composition that includes swirling Rococo shells and foliage interspersed with emblems of war, insignia of nobility, flying cherubs and more dignified figures such as Mars and Bellona presented in an Arcadian pastoral setting. The restless energy and seemingly effortless ingenuity of the decoration contrasts with the tendency towards exaggeration

and stylisation that is evident in later works dating from the last decade of his career.

Despite the remarkably skilful nature of the work at Würzburg, critical evaluations of Bossi's oeuvre are complicated by the fact that he employed a wide circle of assistants. At certain periods these numbered more than forty craftsmen including Giuseppe Vennino, and Bossi's relatives Maderno, Agostino, Ignazio and Carlo Bossi. These craftsmen often executed the actual decorations, following designs provided by Bossi in large drawings traced in charcoal. Some of Bossi's preparatory models have been preserved and illustrate the quality of his work; they were extremely precise and detailed indicating the completeness of his ideas even in early stages of a project. Bossi also executed frescoes at Würzburg and other important buildings. After training with the artist Rudolf Byss, he painted the ceiling of the Knights' Dining Hall in the Residenz in 1737, and in 1746–49 he executed frescoes in the large Hall in the Juliusspital (Hospital of St. Julian; destroyed).

Bossi was also very skilled in *scagliola* decoration and in sculpture in the round. He fashioned stucco sculpture in the Court Church (the altar of the Immaculate), and stucco figures in the wall-niches of the Imperial Hall at Würzburg represent-

ing Apollo, Neptune, Juno and Flora, whose forms were characterised by an impressive harmony, elegance and suppleness. These works made a strong impression on other artists active in the Residenz including the court sculptor, Johann Wolfgang van Auwera (1708–56), and the stuccoist Ferdinand Hundt.

As a result of the fame arising from his work for the Prince-Bishop Schönborn and for court palaces in other locations in the region (for example, Schlöss Werneck, 1744–52, the palace of Veitshöchheim, 1752–53, many churches in Gailbach, 1747–48, and at Gaukönigshofen near Ochsenfurt, 1751–52), Bossi received numerous other commissions from private patrons and religious institutions in Würzburg. In addition to the documented works, several schemes for the interiors and exteriors of buildings in the historic city centre have been attributed to him on stylistic grounds, although in some cases these must have been carried out by his assistants and imitators.

Bossi's genius brought a new direction and fresh impetus to the local tradition of stucco modelling in Würzburg, creating a tangible and characteristic Würzburg Rococo style that became justly famed throughout Germany. But, with the exception of the spectacular works in the Residenz, there is little of Bossi's signed work in the city that survives intact. Sadly, much was destroyed in the 19th century or was damaged during World War II and as a result we can only partially evaluate the true extent of his skills.

Boucher, François 1703–1770

French painter, engraver, and designer of porcelain and tapestries

François Boucher was one of the most celebrated and prolific decorative artists of the 18th century, receiving numerous royal and private commissions at a time when France's influence on fashion and design was at its height. An artist closely associated with the reign of Louis XV, his work is considered by many to embody the indolence and hedonism of the social elite in the middle decades of the century. And although he was not a creator of the Rococo style, Boucher became one of its leading exponents and its popularity coincided with his most innovative and accomplished years.

Boucher was primarily a painter, but his natural affinity for decoration and ornament meant that his designs could easily be translated into a variety of decorative media. He worked directly for the Beauvais (from 1734) and Gobelins (from 1753) tapestry works, and for the Royal Porcelain Factory at Sèvres (1750s), and his designs continued to be used long after his personal involvement with these manufactories had ceased. He also published numerous suites of ornament, including the *Nouveaux Morceaux pour des paravants* (1737), the *Livre de Cartouches* and the hugely successful *Chinoiserie* series (from c.1740). These designs provided valuable source material for decorators throughout Europe and, reproduced on panels, fabrics, porcelain and in marquetry, they enhanced Boucher's reputation as effectively as the direct export of his canvases, tapestries and porcelain. His influence spread to many countries, including Britain and Italy, and can be seen as far afield as Sweden where the Chinoiserie interiors at Kina, Drottningholm, are clearly indebted to his designs.

Boucher's style was an amalgamation of artistic influences which included the Italian decorative tradition, the Flemish and Dutch schools, and in particular the work of the French painter, Antoine Watteau. Another more immediate stimulus was provided by the world of the theatre (Boucher executed several stage designs for the Opéra) whose influence is evident throughout his life-long association with the applied arts. Yet, ultimately, Boucher developed a highly personal style that is his alone. Characterised by the pursuit of pleasure and an atmosphere of gentle eroticism, he created a languorous dreamworld of mythologies, romantic pastorals and enchanted landscapes rich with reminiscences of Italy. And the sense of artifice was reinforced by the use of light and airy pastel shades, particularly powdery blues, pinks and lilacs, and the lack of perspectival depth.

The sensuous and decorative nature of this style appealed particularly to members of the closely interwoven world of the French court and the wealthy Parisian bourgeoisie, many of whom rejected the large-scale architectural decorations exemplified by Louis XIV's Versailles in favour of a more informal

approach to interior design. Boucher's work was particularly well-suited to the relatively intimate scale of their city dwellings where the fashion for gilded panelling and mirrors often limited the space available for paintings to overdoors and areas above the wainscoting. The suite of large-scale paintings executed for the lawyer François Derbais for his hôtel in the rue Poissonnière, Paris (c.1732–34) is without parallel in Boucher's work. His paintings were almost always executed for specific locations and formed part of an integrated decorative scheme where the function of the room and the intended decorative harmony between ornament, furnishings and painting dictated the subject and handling. The fact that many of these original settings have been destroyed and their contents dispersed to museums or private collections makes an appreciation of Boucher's contribution to interior design more problematic. A notable exception is the set of four grisailles paintings depicting the Virtues, which were commissioned for the *chambre de la reine* at Versailles where they remain to this day.

As part of the team of artists working on the redecoration of the Hôtel de Soubise, Paris (1738), Boucher was commissioned to paint seven overdoors which included mythologies, landscapes and pastorals. The most novel were the two pastorals *Le Pasteur Galant* and *Le Pasteur Complaisant* which reworked the tradition of idealised portrayals of shepherds' lives to concentrate upon the depiction of their amorous pursuits and pastimes. This genre was to become one of the mainstays of Boucher's career and the modernity of his approach to these subjects is demonstrated by his *Summer* and *Autumn* pastorals of 1749 (now in the Wallace Collection, London), which were inspired by contemporary pantomimes performed by the Théâtre de la Foire. The *Venus* panel at the Hôtel de Soubise also illustrates Boucher's ability to adapt his compositions within the frequently complicated, fanciful shapes of Rococo frames.

Boucher became the favourite artist of Louis XV's mistress, Madame de Pompadour (1721–64), whose view of painting as primarily a decorative medium makes those works executed under her patronage especially interesting. Among her many commissions for interiors were Boucher's decorations for a Chinese boudoir at Bellevue and an octagonal boudoir at Crécy. Both châteaux have since been destroyed but several of Boucher's paintings, including the eight panels for the Crécy boudoir (now in the Frick Collection, New York), depicting allegories of human activities such as the Arts and Sciences, have survived. The use of children – as opposed to adults – in this series, largely attired in contemporary dress, was in keeping with the fashion of the 1750s but also represents Boucher's fondness for rosy-cheeked infants and putti many of whom feature in his most popular works. Boucher's masterpieces, *Le Lever* and *Le Coucher du Soleil* (1753 and 1752, Wallace Collection) were also commissioned by Madame de Pompadour, and were subsequently reproduced in tapestry form at the Gobelins. Devoid of action or drama, these "galant" mythologies exemplify Boucher's characteristic treatment of "noble" subjects in a lighthearted and sensuous manner. Both were more than ten feet high and were hung with pendant tapestries in Bellevue between 1754 and 1760. The striking effect of canvas and textile in the same design and on such a grand scale can unfortunately only be imagined as the tapestries have subsequently disappeared.

Boucher's mastery of tapestry design, both for wall hangings and upholstery, represents a microcosm of his style, subject matter and influence. His work dominated the output of the Beauvais factory from 1736, the date of his first designs, until the mid 1750s, and in 1755 he took over the prestigious role of Inspecteur at the Gobelins workshops. He adapted with habitual aplomb to the medium of silk and wool, producing designs full of attractive detail with blocks of colour kept to a minimum and boldly defined central figures. Boucher's passion for the exotic potential of Chinoiserie is beautifully expressed in the six designs *La Tenture chinoise* (1743) for Beauvais. His vision of China is less remote and mysterious than that of his contemporaries Antoine Watteau and Jean Pillement, and illustrates an emphasis upon sensuous and corporeal elements that is evident throughout his oeuvre. The series was rewoven many times between 1745 and 1775 and one set, dated 1764, was reputedly sent by Louis XV to the Emperor of China.

One of Boucher's last essays in tapestry design were the central details in the series named *Tentures de Boucher*. First produced in the 1760s, this series was woven by the Gobelins workshops for the music room at Croome Court, Worcestershire (now in the Metropolitan Museum of Art, New York). The designs include *trompe-l'oeil* medallions containing mythologies, set into a background featuring a crimson damask pattern and decorated with birds, garlands of flowers and trophies. The series proved hugely popular, and despite the growing influence of Neo-Classicism it continued to be woven for clients in Russia, Germany, England and Spain, although not in France. A set ordered in 1772 for Osterley Park, Middlesex, still remains *in situ* with a ceiling designed by Robert Adam and chairs upholstered with scenes from Boucher's *Les Amours Pastorales*, and it is perhaps within the context of this intimate room that the modern viewer can best appreciate Boucher's contribution to interior decoration and design.

Boucher's many imitators included his student and son-in-law, Jean-Baptiste-Henry Deshayes de Coleville (1729–65) whose work, like that of Boucher's celebrated student Jean-Honoré Fragonard, is often attributed to Boucher and includes the decorative pendant overdoors of *La Musique* (Corcoran Gallery of Art, Washington, DC) and *Le Dessin*, sold at auction in May 1995. Boucher's own son, Juste-François (1736–82) worked in a pronounced Neo-Classical style and produced numerous engravings relating to many aspects of the decorative arts and interior design. Described at the time as "à la moderne" (in the modern style), his oeuvre included approximately 700 designs for beds, chairs, screens, balustrades and ornament published from the mid-1770s.

Biography

Born in Paris, 29 September 1703, the son of a designer and master-painter, Nicolas Bouché. Probably apprenticed to his father c.1717–c.20; trained as an engraver, 1720; pupil of the artist François Lemoine c.1721–c.23; awarded first prize for painting, Académie Royale de Peinture et de Sculpture, 1723. Married Marie-Jeanne Buseau, 1733; 2 daughters and one son, the designer and engraver Juste-François Boucher (1736–82). Employed in making designs for engravings for Jean-François Cars c.1723–28. Travelled to Rome

with the painters Carle, Louis-Michel, and François Van Loo, 1728–30. Active as a painter, engraver, and book illustrator, Paris, from c.1731; employed as a designer by the Beauvais Tapestry Works 1734–55; stage designs for the Opéra, Paris, 1739–48; produced designs for the Vincennes porcelain factory, from 1749, and remained involved with the factory after its move to Sèvres, 1753. Taught drawing and engraving to Mme. de Pompadour (1721–64), 1751, who remained his most important patron. Appointed Inspecteur sur les Ouvrages de la Manufacture des Gobelins, 1755. Elected Professor, Académie Royale, 1737; appointed Premier Peintre du Roi and Director, Académie Royale, 1765 (resigned 1768). Exhibited at the Paris Salon from 1741. Published several suites of Chinoiseries and ornament from late 1730s. Died in Paris, 30 May 1770.

Selected Works

Notable collections of Boucher's tapestries are in Osterley Park, Middlesex; the Musée des Arts Décoratifs, Paris; the J. Paul Getty Museum, Malibu; the Metropolitan Museum of Art, New York, which includes the tapestry room from Croome Court; and the Philadelphia Museum of Art. Examples of porcelain with designs after Boucher are in the Musée National de Céramique, Sèvres.

Interiors

- 1732–34 Hôtel, rue de Poissonnière, Paris (paintings for the salle de billiard): François Derbais
- 1738 Hôtel de Soubise, Paris (overdoors for oval salon)
- 1738–39 Versailles (paintings for the Galerie des Petits Appartements du Roi)
- 1741–43 Château de Choisy (paintings and overdoors)
- 1747 Château de Choisy (paintings for the Grand Cabinet des Jeux)
- 1748 Château de Fontainebleau (paintings for the Salle à Manger du Roi)
- 1753 Château de Fontainebleau (paintings for the ceiling of the Cabinet du Conseil)
- 1754–60 Château de Bellevue (paintings and tapestries for the Chinese boudoir)

Boucher's designs for tapestries included the *Fêtes Italiennes* (1736), the *Story of Psyche* (1741), *La Tenture chinoise* (1743), *Les Amours des Dieux* (1758), and the *Tentures de Boucher* (1764).

Boudoirs and Dressing Rooms

Dressing rooms emerged as one of the private rooms leading off the State Apartments in grand houses from the 17th century, but the precise origins and function of the boudoir are less clear. The term itself has been linked to the French word *bouder* meaning to pout or to be sulky, and it has been suggested that the boudoir was therefore originally a private withdrawing room or place in which to sulk. Among architectural historians, however, the term boudoir is generally accepted as deriving from "Bower", the name used to designate the second chamber within early medieval buildings. From quite an early period the bower had feminine connotations and was regarded as a room for ladies, but as houses became larger and their rooms more specialised, the second chamber increasingly served as a parlour and lost some of its distinction as an apartment exclusively for the use of women. With the provision of private or family apartments in the latter part of the 14th century, a Lord's Chamber or Parlour was added, often adjoining the sleeping chambers on the upper floors. A Lady's Chamber (or bower) was often provided in larger houses in proximity to the Withdrawing Room and, according to the historian Bannister Fletcher, probably answered the purpose of the best bedroom.

By the 15th century, the Withdrawing Room and Lady's Bower, which had previously contained beds, were both in many cases reserved as Sitting Rooms. The term "Lady's Bower" seems to have become obscure during the 16th and 17th centuries, and "chambers" came to denote bedrooms. During this period the boudoir was often indistinguishable from the closet, a small room or rooms off the bedroom that might serve as a dressing room, study or *garde-robe*, and that was a feature of both male and female sets of apartments.

By the mid-18th century a separate boudoir was a common

Boudoir at 3 West Halkin Street, London, 1891

feature in many larger aristocratic homes. In his *L'Art de Bâtir des Maisons de Campagne*, published in Paris in 1743, Charles-Etienne Briseux, for example, suggested that another small closet, called a boudoir, might be added to the "arrière cabinet" and the two "garderobes", which comprised the suite of rooms behind the bedchamber. Similarly, Victor, Marquis de Mirabeau, writing in *L'Ami des Hommes*, 1759, remarked that every great house should have suitable provision of "mezzanines, closets, garderobes and boudoirs". To a large extent this interest reflected an increased desire for privacy and relaxation among the owners of grand 18th-century homes, and the boudoir was perceived as a place in which to retreat from public gaze and the cares of public life. Its appearance was therefore frequently intimate and informal, in marked contrast to the formality of the decorations and furnishings used in State rooms. Nevertheless, boudoirs were often luxuriously and exotically appointed employing decorative schemes that were both imaginative and innovative. Madame de Pompadour, for instance, lavished especial care on the decoration of her boudoir at Bellevue (c.1748) which included costly

embroidered silk hangings, and overdoors painted with chinoiserie by François Boucher. The boudoir owned by her brother, the Comte de Marigny, was decorated with "nudities", and the association of the boudoir with loose-living or erotic dalliance lasted for many years.

In Britain, the boudoir at Attingham Park, Shropshire, decorated in the late 1780s, serves as a fine example of ornament treated in the elegant Louis Seize style. The room is thought to have been painted by Louis-André Delabrière who was employed by the Daguerre company based in London from 1786. The boudoir at Shugborough, Staffordshire, dates from 1794. It is decorated with grey moiré wallpaper embellished with plain and cut-out floral borders supplied by the Eckhart Brothers of Chelsea, leading manufacturers of wallpaper in the late 18th and early 19th centuries. In both rooms the decorations reflect the most modish of tastes and they illustrate the extravagance with which such interiors were often treated.

While dressing rooms were used by both sexes throughout this period and later, by the 1780s several authors including Le Camus de Mesnière, author of *Le Genie de l'Architecture*, were

suggesting that the boudoir was a room for use by the women of the house only. This idea became even more firmly entrenched in the 19th century when Robert Kerr, author of the influential *The Gentleman's House*, described the boudoir as being "the private parlour of the mistress of the house". Gervase Wheeler, author of *Rural Homes, or, Sketches of Houses Suited to the American Life* of 1851, expressed a similar view when he declared it to be "a little gem of a room ... for the lady of the house", advising prospective builders "whether boudoir, book-room, or work-room, as its fair presiding deity may determine, let it have the sunniest aspect, the most charming prospect you can give it, for there will the taste that can best enjoy the enjoyable ... mostly congregate" (Thornton, p.219).

During this period the boudoir became firmly established as the feminine equivalent of the masculine study. While still a semi-private room it lost its connotations of dalliance and the daybeds, ottomans, and chaise-longues typical of earlier examples were replaced by more restrained furnishings such as light upholstered chairs and writing desks. Colour schemes were pale and overtly feminine in character and picturesque plans – "octagonal or oval or quaintly cornered" – were recommended. Boudoirs were also frequently given a distinguishing feature – a bay or an oriel window, and often had their own staircase. Male guests were rarely admitted, and an invitation to enter this room was occasion for remark. A male visitor to Lady Spencer's "sanctum sanctorum" at Althorp House in the 1870s described "a prettily furnished den. She showed me the many conveniences of her writing table, the pretty furniture and setting", while Henry James recorded being extended a similar privilege by the lady of the house during his visit to Eggesford Manor.

Within aristocratic houses the decoration of boudoirs continued to reflect a mixture of fashionable and personal tastes and were often still extremely splendid. An elaborately tented interior graced Queen Hortense's boudoir in her Paris residence in the rue Cerutti, illustrated in 1811, while the boudoir in Thomas Hope's Deepdene of 1807 was decorated in a fashionable Greek Revival style and included a chimneypiece of Mona Marble, a baldaquin supported over the sofa inspired by Charles Percier, and additional furniture designed by Hope himself. During the last quarter of the 19th century, boudoirs in artistic houses often favoured exotic effects inspired by Far Eastern decoration and design. The example in Mrs. Ellen Montagu's house at 96 Lancaster Gate, illustrated in a water-colour by Nicholas Chevalier in 1875, is furnished in the Aesthetic Anglo-Japanese taste and includes an extraordinary assemblage of genuine and fake oriental bamboo furniture and other lacquered goods. The boudoir at Clouds, the home of the Hon. Percy Wyndham and his family, was altogether less flamboyant, and had papered walls, white woodwork and plain, loosely draped curtains. The comparatively simple decorations and the elegant 18th-century English furniture conformed to progressive Arts and Crafts taste and were in marked contrast to the overtly feminine Louis XVI and Rococo Revival styles favoured in more mainstream boudoirs of this period.

In smaller, middle-class houses of the mid- and late 19th century, the boudoir was often no more than a secondary and smaller sitting room or parlour, and was reserved for the private use of the family, leaving the main drawing room for

the entertainment of guests. According to Robert Kerr, "when the Drawing Room itself is very large, this arrangement has its advantages, but it is manifest that such a Boudoir is really a Morning Room". And he went on to declare that as regards its site or position within the house, the Boudoir should be regarded as a "Sitting Room and open ... from the principal corridor of the house" adding "It may be somewhat retired in situation ... although not restricted in free access, it being the lady's business room". In fact, what is often shown as the boudoir on 19th-century plans was in reality an additional small drawing room, and if the two were connected by communicating doors as was often the case in order to extend the drawing room for functions, then the resultant lack of privacy could not really justify definition of the room as a boudoir.

While descriptions of boudoirs continue to appear in decorating manuals of the Edwardian period, they clearly became increasingly anachronistic in modest-sized homes, and the use of the term seems to have been reserved for a few houses of grand pretensions that aped the lifestyle of an earlier generation. Even those houses which by today's standards would be considered opulent, with billiard rooms and servants' halls, rarely included boudoirs in their plans, although when they did appear they were still as large as any of the main reception rooms. More often, the need for a private, ladies or family room was met by the provision of a small sitting room which took on many of the connotations of intimacy and informality traditionally associated with boudoirs. Today, the term is rarely used other than ironically.

Boulle, André-Charles 1642–1732

French cabinet-maker and sculptor

André-Charles Boulle's illustrious status within the history of European furniture has endured from his own lifetime to the present day. His name is not only synonymous with the technique of marquetry that he perfected, but with a genre of highly elaborate and skilfully executed furniture that reflected his patrons' passion for ostentatious display. Although his family originated from the Dutch-German border, Boulle is acclaimed as the first great French *ébéniste* and the most celebrated of Louis XIV's furniture makers and designers. Boulle was granted the title of *ébéniste, ciseleur, doreur et sculpteur du roi* (1672) allowing him the position of bronze founder and cabinet-maker. He exploited this dual role to design furniture marked by an unprecedented stylistic harmony between the form, marquetry and gilt-bronze mounts. Perhaps ironically, Boulle supplied very little furniture to Louis XIV himself, who seems to have preferred the work of Pierre Gole (c.1620–84) and Domenico Cucci (c.1635–1705). But Boulle executed work for other members of the royal family and private commissions for the nobility and bourgeoisie, as well as foreign royalty including Philip V of Spain.

Boulle was employed in the service of the Bâtiments du Roi, which was concerned with the furnishing and maintenance of the French royal palaces. On the evidence of the Bâtiment's accounts, it seems he was mainly responsible for the execution and restoration of marquetry and parquet floors and for the production of ornaments in gilt bronze. Between 1682 and 1683, Boulle was employed in the decoration of the Dauphin's Appartement de l'Aile du Midi, Versailles. The masterly conception and execution of the marquetry floor and wainscoting is said to have established his reputation among his peers. According to contemporary accounts, the *Cabinet* was decorated on the walls and ceiling with mirrors set in octagonal and square borders of gilt bronze on a ground of ebony, pewter and brass marquetry. The floor itself was of inlaid wood, embellished with many decorations including the emblems of the Dauphin and Dauphine. Yet the history of this magnificent decor is unclear. Most histories state that in the year following its completion the whole decorative ensemble was dismantled by order of the king and adapted for the Dauphin's new apartment on the ground floor of the palace. But a paper by J.C. Le Guillon given at the *Colloque Versailles* (1985) suggests that both Boulle and Pierre Gole, who had collaborated on the original decoration of the *Cabinet*, were commissioned to execute a completely new decor. The Dauphin's plan to economise and install the previous interior was abandoned because the two apartments differed in proportion. Le Guillon also suggests the possibility that the floor was adapted for another room in 1688. It is therefore uncertain whether contemporary sources describe the 1683 decoration or the completely new ensemble of 1684. The extent of Gole's involvement in Boulle's famous achievement is also unclear. The *Cabinet* itself fell into disrepair with the death of the Dauphin in 1711 and after subsequent refurbishments did not survive the 18th century.

Boulle's output is at once extraordinarily inventive and homogeneous. Its principal characteristics are sombre nobility

and vigorous monumentality with elaborate and costly marquetry, wood veneers and gilt-bronze mounts. The lavish effect of such contrasting materials against the marble-lined walls or gilded white paneling of French palaces of the period is often lost in modern museum settings. Although he did not invent "Boulle marquetry" (called *tarsia a incastro*, of Italian origin, and employed in the German states) Boulle nevertheless developed it into a highly distinctive and personal style. The typical Boulle ensemble combines brass and tortoiseshell with those areas not decorated with marquetry veneered in ebony. The delicate designs of scrollwork and arabesques were cut, in a single layer or as a "sandwich" of layers, using a fret-saw probably only a millimetre in thickness. The brass and sometimes the shell were engraved for a richer appearance.

Brass on a ground of shell (*première partie*) or vice-versa (*contre-partie*) could be used to stunning effect on pairs of furniture pieces. Boulle often combined the two so that, for example on a wardrobe, the door panels were of *première partie* and the sides of *contre-partie*. Variations were introduced by using other metals – for example, pewter or copper – and materials such as mother-of-pearl and imitation lapis lazuli, and he also used painting or attached coloured foils (red, green and blue) to the reverse of the shell. Boulle not only worked to his own patterns but also to the designs of famous contemporary ornamentalists, including the fashionable grotesques and *singerie*s of Jean I Berain. Boulle was also a master in polychrome wood marquetry, in particular the floral marquetry in favour during the 1680s. His masterpiece in this medium is the naturalistic panel which was remounted onto an English cabinet in the 18th century which is now in the Bowes Museum, County Durham. Other examples exist of panels in wood and shell / brass marquetry decorating the same piece and, more unusually, wood set into a ground of shell.

As a talented sculptor, Boulle incorporated sculptural elements into the general design of his work. Gilt-bronze mounts were made on a larger scale and in greater profusion and were given a dominant role which was new to furniture manufacture. All these works were original creations and of the highest quality; they were modeled by the finest sculptors of the day and cast in Boulle's workshop. Classical mythology was the predominant influence, a speciality being pictorial bas-relief mounts of Ovid's *Metamorphoses* (Apollo and Daphne, Apollo flaying Marsyas). Boulle also popularised the theme "Love triumphing over Time" in sculptural form for clocks.

If it is difficult to evaluate the role played by Boulle in the invention of furniture types such as the commode, the bas d'armoire and the bureau plat, which were all well represented in his oeuvre, his influence in the development of furniture styles is uncontested. Moving away from the simple, heavy forms produced by his contemporaries in the last decades of the 17th century, Boulle introduced lighter and more dynamic designs. This developed into the cabriole legs and swelling forms characteristic of his output between 1700 and 1725, heralding the Régence style. Examples which encapsulate Boulle's style and craftsmanship are the magnificent pair of commodes supplied in 1708 to the bedchamber of Louis XIV at the Grand Trianon and now at Versailles. A valuable source for his models and decorative details is the folio of engraved designs *Nouveaux Deisains de meubles ...* (1707–30) by Pierre-Jean Mariette,

Boulle: designs for desk, commode, and armoire

which includes clocks, inkstands, desks, cabinets, tables, mirrors and candelabra.

The longevity of furniture production in the manner of Boulle is one of its most unique aspects. The workshop itself employed four of Boulle's sons and accounted for over 80 years of production. Its direction was continued by Boulle's son Charles-Joseph (1688–1754) after Boulle's death in 1732. Numerous famous *ébénistes* were trained there, including some, like Etienne Levasseur (1721–98) who continued to restore and manufacture “Boulle” furniture independently. Levasseur and other craftsmen such as Philippe-Claude Montigny (1734–1800), specialised in pastiches of the Boulle style, occasionally reusing original marquetry panels. As none of the Boulle workshop's output was stamped, the inherent problem of attribution is exacerbated by such imitations.

The popularity of Boulle's style endured throughout the 18th century. Although it waned slightly during the Rococo period, the advent of Neo-Classicism encouraged a sense of nostalgia for the reign of Louis XIV and Boulle's furniture was the only type of its period to enjoy uninterrupted acclaim. Boulle's standing also remained undiminished in the 19th century, especially among English enthusiasts for French fine and decorative art, several of whom, like King George IV and the Marquess of Hertford, built up unrivaled collections of 18th-century French furniture. A portrait of George IV by

Thomas Lawrence in the Wallace Collection, London, shows the king seated next to a Boulle pedestal table and inkstand; the table is now in the Crimson Room of Windsor Castle. The 4th Marquess of Hertford (1800–70) not only purchased many pieces of Boulle furniture but also commissioned seven replicas after his work, six of which were made by John Webb of New Bond Street, London. One, a copy of the Elector of Bavaria's desk (Louvre, Paris), remains in the Wallace Collection today.

CHRISTINE RIDING

Biography

Born in Paris in 1642, the son of an *ébéniste* of Flemish origin. Trained by his father. Married Anne-Marie Leroux in 1677: 7 children including Jean-Philippe (1678–1744), Pierre-Benoit (1680–1741), André-Charles II (1685–1745), and Charles-Joseph (1688–1754), all *ébénistes*. Active as an *ébéniste* by 1664; appointed *Ébéniste du Roi* and took over the lodgings of the cabinet-maker, Jean Macé, in the Louvre, 1672 (workshops enlarged in 1679, and c.1685); worked in the service of the *Bâtiments du Roi* from c.1672. Designs for furniture and bronzes published by Mariette after 1707. Business transferred to his sons, 1715. Amassed a vast collection of prints and drawings, including works by Le Brun, Cotellet, Loir, Polidoro, Enea Vico, Agostino Veneziano, Le Pautre, Jean Berain, and Jacques-Antoine Ducerceau, much of which was destroyed in a

fire that gutted the Boulle workshops in 1720. Granted a royal pension, 1725. Died in Paris in March 1732. The workshops continued to be run by Boulle's four sons.

Selected Works

The output of the Boulle workshop was enormous and numerous items have been attributed to his hand. The more important collections of Boulle furniture are in the Wallace Collection, London; the Musée du Louvre, Paris; the château of Versailles; and the J. Paul Getty Museum, Malibu. Examples of Boulle's drawings are in the Musée des Arts Décoratifs, Paris. A list of Boulle's interior commissions for the Bâtiments du Roi and a list of his principal works appears in Pradère 1989.

Interiors

- 1672–75 Petite Chambre de la Reine, Versailles (marquetry daises)
- 1682–83 Appartement de l'Aile du Midi, Versailles (marquetry floor and wainscoting)
- 1684 Appartement de Monseigneur, Versailles (marquetry floor and wainscoting)

Boyle, Richard. See Burlington, Earl of

Brenna, Vincenzo (Vincentso) 1747–c.1819

Italian architect

Vincenzo Brenna lived and worked in several European countries, but the most fruitful period of his career was associated with Russia and, in particular, with St. Petersburg. It was here that he achieved his greatest success, becoming one of the leading exponents of Russian Classicism at the end of the 18th century.

Brenna began to work as an artist in his homeland, Italy. He trained in the studio of S. Pottsi who painted in a late Baroque style, and then continued his art education in France. Brenna's views on art were influenced by a study of antiquity, and an enthusiasm for the Renaissance. His first major works were measurements and sketches from paintings of Roman monuments – Nero's Golden Palace (1774 with the Polish artist F. Smuglevich) and the villas of Pliny the Younger, the so-called Laurentium (1777–78). The experience which he gained from copying arabesque and grotesque patterns and drawings on the theme of ancient mythology had a powerful influence on his subsequent work, and the extensive use of reworked motifs from antiquity is a characteristic feature of Brenna's designs in all his later projects.

In 1780 Brenna was invited to Poland by Count S. Pototsky and he worked there for several years on castle interiors and the palaces of leading magnates. In the frescoes and *plafonds* which he completed for August Chartorisky's palace in Natoline-Bazhantarni near Warsaw (1781), Princess Isabella Chartoriskaya Liubomirskaya's castle in Lantsut (1781), Marshal Stanislaw Liubomirsky's estate in Grushchin (1781), the palace belonging to the Polish king's sister, Isabella Ponyatovskaya-Brannitskaya, in Warsaw (1782), and Rech' Pospolitaya's palace (1783), Brenna showed himself to be the master of polychrome painting.

In his spectacular decorative compositions, Brenna used the ornamental motifs which he had come to love, as well as turning to the legacy of Renaissance and Baroque artists. Brenna's paintings united classical principles with the Baroque effects of perspective painting and the illusion of expanding space.

Brenna's work as an artist and interior designer brought him wide renown. In 1784 he received an invitation from the heir to the Russian throne, the Grand Duke Paul, to go to Russia. He undertook the task of decorating the interiors of the splendid palace at Pavlovsk outside St. Petersburg, built by Charles Cameron. From 1786, Brenna took charge of the completion of the state rooms in the palace and he introduced several changes in its internal decoration and planning. Apart from introducing stucco moulding, friezes and *plafonds* into Cameron's interiors, Brenna drew up his own designs for many of the rooms. The interior design of the palace was completed in 1794. However, with the accession of Paul I to the throne in 1796, further work was begun on extending the palace and Brenna found himself in demand as an architect, subsequently becoming the first architect of the Imperial court. Work on the creation of new architectural and artistic interiors at Pavlovsk continued right up to 1801.

Brenna's interiors kept to classical forms. However, in contrast to Charles Cameron, who was an advocate of strict

Brenna: library, Pavlovsky Palace, 1786–1801

canons of style, Brenna favoured a saturated decorative style and put forward new methods which led people to view him as the precursor of the Empire style in Russian art. The decoration of the state rooms at Pavlovsk combines architectural elements, which act as the compositional basis for the interior design, with rich painted and relief decoration, decorative fabrics and *objets d'art*.

Triumphal motifs predominate among the themes of the bas-reliefs, marble statues and wide stucco friezes. Magnificent marble fireplaces, which Brenna transformed into complex architectural compositions, formed part of the single ensemble. The ornamental paintings, *plafonds*, gilded moulding and complex caisson ceilings were a no less significant part of the decoration. Brenna himself decorated the walls and *plafonds*, which were close stylistically to his Polish works; he also collaborated with the eminent artist and decorator Pietro Gonzaga, whom he invited specifically for the purpose and who decorated the interiors with frescoes and paintings containing the illusion of perspective. The Russian sculptors I.P. Prokofiev, M.I. Kozlovsky and I.P. Martos also worked on the palace's decoration. Brenna designed furniture for each room and his sketches show the breadth of his talent. Bureaus and writing desks were made from his designs, as well as other items made out of fine pieces of wood with gilded details standing out in relief against their background. Brenna's

massive and rather heavy furniture is largely typical of the Pavlovsk period.

Another important undertaking by Brenna for Paul I was the reconstruction and decoration of the interiors of his palace at Gatchina near St. Petersburg, built by Antonio Rinaldi. The interiors were damaged during World War II and partially restored in the 1970s and 1980s. Brenna redecorated the main state apartments, including the Crimson and Cheshmenskaya galleries, the Marble Dining Room, Paul I's Throne Room and the Empress' main bedroom. The decoration in these rooms, which included marble, bronze, gold and tapestries, is typical of Brenna's work. In designing the interiors of the state rooms at Gatchina, Brenna turned to the decorative methods of the Roman Empire and of 17th-century French Classicism, in order to emphasize the triumphal nature of the decoration and the might of the Russian Empire and its monarch. Features of the Empire style, which are typical of Brenna's art, appear more consistently here. There was a great deal of decorative stucco moulding and sculpture in the sumptuous architectural and painted decoration, including busts of Roman emperors, bas-reliefs on the theme of ancient history, copies of ancient works of art and original statues. Brenna's skill as a craftsman is evident in his compositions of military campaigns and the military motifs in the sculptures on the walls of the *Cheshmenskaya* gallery.

Brenna's greatest achievement as architect and interior designer came with his work on the interiors of Mikhailovsky Castle (1797–1801; parts of the original building remain), which he built from initial designs by B.I. Bazhenov to be the Imperial residence in St. Petersburg. The plan of the castle, a square enclosing an octagonal inner courtyard, was proposed by Paul I himself and the Emperor devoted much attention to the completion of his grandiose project, spending vast sums on sumptuous decorations for the building.

In solving the spatial problems which the Mikhailovsky Castle posed, Brenna successfully combined rooms of all shapes and sizes: square, circular, triangular and oval halls all make up the state rooms and living quarters. He made extensive use of decorative materials for the rich architectural and artistic interior design. The palace's rooms were filled with works of art; paintings, sculpture and *objets d'art* played a crucial role in the decor. The interiors were decorated with ancient statues and sculptures by I.P. Prokofiev, who had worked with Brenna at Pavlovsk and Gatchina, as well as paintings by S.F. Shchedrin, A.E. Martinov, G.I. Ugriumov, Y.Y. Mettenleiter, A.Vigi, K.P. and J. Skotti, G.F. Dwain, and F. Smuglevich. The combination of coloured plate-glass with paintings, gilded carving and bronzes had never been attempted before. As in Brenna's earlier projects, decorative cloth, tapestries, silks, velvet upholstery and drapes all played a significant role in the decoration of the main interiors. Brenna also used coloured stone – his massive columns and wall facings were made of marble, porphyry and other types of stone.

The interiors of the Mikhailovsky Castle underwent repeated changes. Today the original internal decoration survives only on the main staircase, in the hall of the Resurrection, the Large Throne Room and the Raphael Gallery. The Mikhailovsky Castle became a symbol and monument of the Pavlovsk period and was the most significant of

Brenna's undertakings in Russia. As a mark of Brenna's services to Russian art, Mettenleiter painted an allegorical portrait of him on the *plafond* in the Raphael Gallery.

While working on the Mikhailovsky Castle, Brenna altered the interiors of the Winter, Tauride, Kamenny Ostrov and Marble Palaces, which belonged to the Imperial family. He redecorated and furnished a number of rooms in the Winter Palace (1796–98), using expensive materials, paintings and gilding as he had in the Mikhailovsky Castle. Brenna also made alterations to halls in the court Hermitage Theatre (1797). He restored Quarenghi's interior, stripped the dilapidated walls and repeated the ordered composition of his predecessor, although he did replace the columns with pilasters. The decoration of the Kamenny Ostrov Palace (1797) was equal to that of the Winter Palace. Brenna painted the main state rooms and furnished them with gilded furniture.

Brenna was frequently called upon to decorate the Imperial palaces and churches in St. Petersburg for funerals. After the execution of Prince Loudovic XVI, a decorative catafalque was built from a design by Brenna in the Polish Roman Catholic Church of St. Catherine (1793). Later, after the death of the Empress Catherine II, Brenna designed interiors for the Peter and Paul Cathedral (Fortress) and the Georgian Hall in the Winter Palace (1796).

The beginning of the 19th century marked a decline in Brenna's creative activities. In 1802, a year after the death of his patron and main client, Paul I, Brenna was dismissed and left Russia. He spent the last years of his life in France and Germany without work.

Brenna is renowned in the history of Russian art and architecture not only as an eminent architect and designer, but also as tutor to the greatest architect of the 19th century, Karl Rossi, the founder of the Russian Empire style who continued the artistic methods first employed by Brenna.

MARIA L. MAKOGONOVA

Biography

Born in Italy in 1747. Lived and worked in Rome during the 1770s; trained in the studio of S. Pottsi; published an album of drawings from *Thermae*, 1776. Active as an interior designer and architect in Poland from 1780. Moved to Russia, 1784; worked in the service of the Grand Duke Paul (later Paul I) on several royal palaces, dismissed 1802. Toured Europe with his pupil, Karl Rossi (1775–1849), 1802–05; retired to France. Died in poverty in Dresden, c.1819.

Selected Works

Interiors

- 1784–94 Pavlovsky Palace, Pavlovsk (design, decoration and furniture of the state rooms including the Italian Hall, Grecian Hall, and Grand Vestibule)
- 1796–98 Hermitage, St. Petersburg (restoration of interiors)
- 1796–98 Winter Palace, St. Petersburg (decoration and furniture)
- 1797 Kamenny Ostrov Palace, St. Petersburg (decoration and furniture for main state rooms)
- 1797–1800 Gatchina Palace, near St. Petersburg (redcoration of main state apartments; building by Antonio Rinaldi)
- 1797–1801 Pavlovsky Palace, Pavlovsk (enlargement and additions including the new Throne Room, Picture Gallery, orchestra room, and chapel)
- 1797–1801 Mikhailovsky Castle, St. Petersburg (building, interiors and furniture; assisted by Karl Rossi)

Breuer, Marcel 1902–1981

Hungarian architect and designer

Marcel Breuer was the most famous student of the Bauhaus and is a key figure in the history of Modern architecture and furniture design. Progressive and forward-thinking in every area of his work, he produced some of the most enduring and iconic designs of the 20th century including his celebrated tubular steel and plywood chairs. He was also an early champion of mass-produced furniture, and he became an influential exponent of the International Style in his architecture and interior design.

Born in Hungary, Breuer was one of many art students wandering Europe in search of a sympathetic art school in the years following World War I. He studied briefly as a painter and sculptor at the Academy of Fine Art, Vienna, and in 1920, at the age of 18, he enrolled at the Weimar Bauhaus. He rose rapidly through the ranks of his fellow-students and was appointed to the teaching staff, along with the other rationalists, László Moholy-Nagy and Josef Albers, in 1923. He became head of the Bauhaus carpentry workshops in 1925 and used the workshops to develop prototypes of the furniture he designed.

His first chair was in wood and woven upholstery and was heavily influenced by the furniture of Gerrit Rietveld and members of the De Stijl group. From them Breuer learned to enjoy the constructional framework of his chairs, tables and beds. These could be hard and rectilinear but the supported elements that made contact with the body were soft and rounded. As his work developed, the supported elements became progressively softer, evolving from straight plywood sheets, through stretched canvas and curved plywood, finally to become upholstery on slats. As the supported elements became softer, the frames got lighter. At first this was achieved by using thinner wooden members; subsequently, it resulted from the use of lightweight metals. Breuer described how he purchased his first bicycle in 1925 and was so impressed by the lightness and strength of the frame that he began to experiment with tubular steel in the production of furniture. His *Wassily* chromium-plated tubular steel chair dates from this period and numerous other designs, including his famous *B32* cantilever chair, were produced between 1925 and 1928. While tubular steel chairs rapidly became almost commonplace among Modernist designers, Breuer's designs from the mid-1920s have never been surpassed and the *Wassily* and cantilever chair are still in production.

The Bauhaus served as Breuer's client as well as his

employer and in 1925 he was put in charge of fitting out the new Bauhaus building at Dessau. Breuer's tubular steel furniture was used in the canteen, in the assembly hall and elsewhere, and it was the first time his work had been produced on such a scale. He was also asked to design the interiors for some of the staff houses. Although these interiors can appear somewhat austere and characterless today, they demonstrate Breuer's liking for built-in units, such as cabinets and wall cupboards, which he designed as standardised modular components to facilitate mass-production. Mass-produced furniture was clearly not a new phenomenon, but Breuer's obvious appreciation of its advantages and his delight in the appearance of something that looked machine-made was unprecedented.

In 1928 he left the Bauhaus and opened his own office in Berlin. Numerous commissions for interiors followed in which he used chairs, tables and standardized storage units of his own design. In the Harnischmacher apartment (1929), for example, the study walls were lined with black lacquered wall-units and bookshelves and the room was furnished – like the dining room – with tubular steel chairs and the *B14* table which Breuer used in many subsequent interior designs. A year later, he designed an apartment space for the *Deutscher Werkbund* section of the 1930 *Salon des Artistes Décorateurs*, Paris. The overall theme of the *Werkbund* section was mass-produced design in architecture, furniture and household objects and Breuer made good use of materials such as linoleum, and simple features such as white blinds, fitted wardrobes and hanging wall units, while virtually all the furniture was tubular steel.

Following the rise of fascism, Breuer left Berlin and spent much of 1932 and 1933 travelling. During this period he built and furnished the Harnischmacher House in Wiesbaden. It was his first free-standing house and was much publicised. Tubular steel and black lacquered wood furniture were juxtaposed with white walls and light linoleum floors. He also began to develop aluminium furniture for retailing by the *Wohnbedarf* home-furnishing stores. His designs for dining chairs, armchairs, stacking tables and chaise longues, won a competition in Paris in 1933.

In 1935, the English architect F. R. S. Yorke invited Breuer to join him as his partner in London. Soon after arriving in London Breuer met Jack Pritchard, a founder of the Isokon furniture company that specialised in bending plywood. Breuer adapted the Paris aluminium chaise longue for production in plywood and the result is arguably the most elegant and justly celebrated of all his furnishings. It epitomises his approach to furniture design, including a frame of great technical sophistication that is obviously factory-made, a form designed to fit the body, and softness where there is contact. Other furniture for Isokon included a set of stacking tables, each made by folding a sheet of plywood, and plywood dining chairs which are clearly the precursors of the more sophisticated Eames dining chair of a decade later. This furniture was used in his interiors for the Isobar, a fashionable meeting place for architects and designers built in Hampstead in 1937.

The most important of the interiors produced by the Breuer and Yorke partnership were designed for the Gane Pavilion, Bristol, in 1936. This was an exhibition house, commissioned by the furniture manufacturers P.E. Gane, whose interiors

served as showrooms for the company's modern furniture. The building itself illustrated a shift away from the strict geometry and hard edges of the International Style. It was an exercise in open and flexible planning with free-standing walls of rough masonry and no internal doors. Natural materials, such as stone and wood, were preferred; plywood walls and ceilings brought warmth and colour to the interiors and the plywood flooring was covered with simple rugs.

In 1937 Breuer settled in the United States, where he became professor of architecture at Harvard, and went into partnership with his old Bauhaus colleague, Walter Gropius. In 1939, he built his own house at Lincoln, Massachusetts, where the white painted timber tradition characteristic of New England architecture is combined with the rough masonry effects explored in the Gane Pavilion. The interior suggests a softening in his approach to domestic design and the space is organised over several levels linked by elegant steps.

Shortly after building this house, Breuer and Gropius designed a home for the Frank family in Pittsburgh. Described as the largest residence ever built in the International Style, it also represented one of Breuer's most complete interiors. Virtually all the contents – chairs, tables, wall units and light fixtures – were specially designed by him for the commission.

Breuer's next home, built in New Canaan, Connecticut, in 1947 is now probably his best-known project and it has become something of a mecca for aficionados of modern architecture. It is also one of his most dramatic designs and has a great cantilevered deck to take advantage of the New England summers. Both the plan and the construction are workmanlike, with a great brick chimney forming the core of the timber building. Gently sloping ceilings of pine boards, and floors of rush matting, continue the softening process.

Other projects from this period include the House for a Middle Income Family commissioned by the Museum of Modern Art and built in their garden in 1949. But it was the commission for the UNESCO Headquarters in Paris (1952–58) that established Breuer's reputation internationally as a major figure within the Modern Movement. Several substantial projects followed, including the St. John's Abbey and University at Collegeville, Minnesota (1953–61) and the Whitney Museum, in New York City. Both buildings have fine interiors but neither are as innovative or individual as his designs of the 1930s and 1940s. And it is for these houses and for his ground-breaking and beautiful pre-war furniture that Breuer will always be remembered.

Biography

Marcel Lajos Breuer. Born in Pécs, Hungary, 22 May 1902. Educated at Allami Főreáiskola, Pécs, 1912–20; studied painting and sculpture, Akademie der Bildenden Künste, Vienna, 1920; attended Bauhaus, Weimar 1920–24. Married 1) Martha Erps, 1926; 2) Constance Crocker, 1940: 2 children. Director of the carpentry workshop, Dessau Bauhaus, 1925–28. Active as an architect and designer of interiors and furniture, Dessau, 1925–28; Berlin, 1928–31; London (with F. R. S. Yorke), 1935–36. Controller of Design, Isokon, London, 1937. Emigrated to the US, 1937; became citizen, 1944. Associate Professor, Harvard University School of Design, Cambridge, Massachusetts, 1937–46. Established architectural and

design practice from 1937; in partnership with Walter Gropius, Cambridge, 1937–41; principal, Marcel Breuer and Associates, New York, 1946–76. Fellow, American Institute of Architects: Gold Medal, 1968; Grande Médaille d'Or, French Academy of Architecture, 1976. Died in New York, 1 July 1981.

Selected Works

The Marcel Breuer Collection, containing much surviving correspondence, bills, contracts, drawings and photographs for the period up to 1951, is in the George Arents Research Library for Special Collections, Syracuse University, Syracuse, New York. For additional documentation relating to Breuer's work for the Bauhaus, see the Bauhaus Archive, Berlin; for Isokon, see the Pritchard Archive, School of Architecture, University of Newcastle, Newcastle upon Tyne; and for Thonet, see the Thonet Archive, Thonet Industries, York, Pennsylvania. Notable collections of Breuer's furniture are in the Victoria and Albert Museum, London, the Museum of Modern Art, New York, and the Staatliches Kunstsammlung, Weimar.

Interiors

- 1923 Haus-am-Ham, Bauhaus Exhibition, Weimar (furniture)
- 1925–26 Bauhaus, Dessau (furniture for the faculty buildings and furniture and interiors for the Masters' Houses)
- 1929 Harnischmacher Apartment, Wiesbaden (furniture and interiors)
- 1930 Apartment for a Boarding-House-Hotel, Deutscher Werkbund Section of the Salon des Artistes Décorateurs, Paris (furnishings and interiors)
- 1932 Harnischmacher House, Wiesbaden (building, furnishings and interiors)
- 1934–36 Doldertal Apartments, Zurich (building, furnishings and interiors; with Roth Brothers)
- 1936 Gane Pavilion, Bristol (building and interiors; with F.R.S. Yorke); P.E. Gane Ltd.
- 1937 Isobar, Isokon Flats, Hampstead (furnishings and interiors; with F.R.S. Yorke)
- 1937 Gropius House, Lincoln, Massachusetts (building and interiors, with Walter Gropius)
- 1938 Breuer House I, Lincoln, Massachusetts (building, furnishings and interiors; with Walter Gropius)
- 1939 Frank House, Pittsburgh (building, interiors and furnishings; with Walter Gropius)
- 1945 Geller House, Lawrence, Long Island (building, interiors and furnishings)
- 1947 Breuer House II, New Canaan, Connecticut (building, interiors and furnishings)
- 1949 Exhibition House, Museum of Modern Art, New York (building, interiors and furnishings)
- 1952–58 UNESCO Headquarters, Paris (building and interiors; with Pier Luigi Nervi and Bernard Zehrufuss)
- 1953–61 St. John's Abbey and University, Collegeville, Minnesota (building, interiors and furnishings; with Hamilton Smith)
- 1963–66 Whitney Museum of American Art, New York (building and interiors)
- 1967–69 Geller House II, Lawrence, Long Island (building, interiors and furnishings; with Herbert Beckhard)

Breuer began designing furniture in 1921. His designs for tubular steel furniture date from 1925, for aluminium from 1932, and for plywood from 1935. His designs were manufactured by several firms from the mid-1920s, including Thonet, Standard Möbel, Wohnbedarf, and Isokon. Certain classic pieces, such as the *Wassily* chair are currently made by Knoll International.

Britain

The movements in British interior design from the 15th to the 20th centuries are by nature indefinite due to overlapping influences, historical references, and guiding principles. Reflecting this inexactness is a classification system in which a variety of labels, derived from monarchs, stylistic references, designers, and typical woods, are used to identify similar and contemporary objects and interiors. Despite this confusion, there are recurrent themes: an overriding emphasis on the reinterpretation of styles derived both from foreign sources and from preceding periods of English history, and an increasing interest in domestic comfort and convenience. These themes characterize British design from the Renaissance to the present.

Within this broad framework, a sequence of stylistic periods

Britain: Long Gallery, Hardwick Hall, Derbyshire, 1590–96

is apparent. A shift from bare fairly utilitarian medieval interiors towards more humanistic Italian Renaissance and French Baroque styles is evident during the 15th to 17th centuries. In the 18th century, Palladian, Rococo, and Neo-Classical designers working in Britain borrowed, mixed, and reinterpreted contemporary and preceding Continental movements within an identifiably British framework. Revivalism reached its height in the mid- and late 19th century with Victorian styles which in turn sparked reform movements, including Aestheticism, Queen Anne, and the Arts and Crafts Movement. During the 20th century, the main thrusts of British design were represented by the English “Country House Style” as epitomized by Colefax & Fowler and Laura Ashley, and by the new modern schools, encompassing both international Modernist movements and British Modernism as promoted by *Daily Mail* Ideal Home Exhibitions and the Festival of Britain (1951).

The high points of this historic progression occurred during the 18th and 19th centuries, when the aristocracy and the newly prosperous upper-middle classes patronised a new breed of highly talented architects who not only designed the structure of buildings but also interior details, furniture, and decorations. As wealth and the demand for design expertise spread to other sections of society, the primacy of the architect-client

relationship was overtaken by the rise of design professionals, whose status was legitimized with the establishment of the Government Schools of Design in 1836. In this sense, the growing cultural supremacy of Britain reflected in the careers of many of the country’s most notable designers, including William Kent, Robert Adam, Thomas Hope, A.W.N. Pugin, William Morris, A.L. Liberty, and Charles Rennie Mackintosh, coincided with and paralleled the growth of the British Empire.

The gradual transition from Gothic church-derived decoration to a more humanistic secular orientation in interior spaces that took place during the 15th and 16th centuries reflected a shift in the peripatetic nature of medieval households towards a lifestyle and surroundings that celebrated the owner in a permanent way. In interior furnishings, the emphasis changed from portable items that were easy to dismantle and transport to objects and decorations that facilitated household ceremony and hierarchy.

The late medieval Gothic style predominated during this period. As a lord and his retinue traveled frequently, comparatively little attention was paid to fixed decoration, and movable furnishings such as plain oak pieces, tapestry wall-coverings, carpets as table covers, and thick rush floor-matting were typical. Folding chairs, trestle tables, stools, and folding

beds with cushions were popular furniture pieces on account of their portability. Churches served as primary sources for the minimal ornament on architectural features, such as windows and doorframes, and on furniture, and decoration such as carved arches, tracery, floral forms such as vines and leaves, and human and animal representations was also borrowed from ecclesiastical models. The actual architecture of the Gothic home, however, differed from the stone churches of the period in the use of oak wall paneling and timbered ceilings. The carved and painted ornament on this paneling was often secular in nature, incorporating armorial devices, heraldic items, and portraits of kings, queens, and other notable contemporaries. Such ornament frequently embellished the principal bedchamber or the great hall, the latter serving as the social and administrative centre of the household.

British design of the early 16th century in many ways reflected the political developments of the period. Following Henry VIII's (1509–47) break with Rome, designers also broke free of ecclesiastical influences and introduced a more humanistic Renaissance style. During the reign of Elizabeth I (1558–1603), a symbolic progression of rooms which facilitated a life of continuous ceremony distinguishes the architecture of the period. Significant features included symmetrical layouts drawn from Italian Renaissance designs, ingenious manipulation of spaces, and an abundance of glass – the latter made possible by developments in engineering and which quickly became an Elizabethan status symbol.

As with architecture, Elizabethan interiors and objects employed a wider range of sources and more ornamentation than in the previous century. And while the influences themselves were often quite varied, a characteristic of much 16th-century woodwork, metalwork, and textiles is the richness of the surface decoration. Examples include elaborately-ornamented silver salts and commemorative cups, cushions embossed with pearls, tapestries of gold needlework, and colorful plaster friezes featuring allegorical references to mythological figures such as Diana, Ulysses, and Gideon. These motifs were inspired by Italian sources that had been adapted by German and Low Countries designers, and the result was a blend of native Gothic and foreign Renaissance styles.

The German painter Hans Holbein the younger (1497/8–1543) designed goldsmiths' work for Henry VIII from 1533 onwards. His designs were in the elaborate Italian Renaissance style incorporating acanthus leaves, arabesques, human heads, putti, and a lavish use of pendant pearls and encrustations of precious stones. Imported Flemish and German pattern books like those by Hans Vredeman de Vries, Wendel Dietterlin, Hans Brosamer, Virgil Solis, and Hans Collaert served as primary ornament sources for refugee Protestant craftsmen working in London. This influx of Continental influences and expertise energized native talent and greatly improved the availability of high-quality metalwork, furniture, and textiles.

Furniture tended to be massive, squat, and richly carved with a mixture of Gothic and Renaissance ornament. Sturdy balusters of cup-and-cover form were common in the legs of tables and supports for cupboards. Marquetry depicting buildings and foliage adorned expensive items such as Nonsuch chests and presentation tables. Elizabethan interiors continued

the medieval tradition of using woven and embroidered textiles on tables and as wall coverings. Table covers and cushions had needlework patterns of flowers, foliage, and coiling tendrils. The majority of tapestry wall-hangings, with the exception of those produced by the workshop founded by William Sheldon in the early 16th century, were imported from the Low Countries and France. Sheldon's tapestries were naive in style and often featured figurative designs of Flemish origin that included birds, flowers, and landscapes.

The arrival of the Renaissance style and Continental craftsmen coincided with the introduction of imported objects suitable for households of varying classes. Local pottery and coarse green Weald glass served humble Elizabethan tables. Imported Chinese porcelain, Iznik pottery, German silver-mounted stoneware, and Venetian crystal glass or English imitations by immigrant Italians such as Giacomo Verzelini dressed the boards of the wealthy and fashionable.

Hardwick Hall, Derbyshire (1587–99) represents the finest of the great Elizabethan Power Houses. Designed by Robert Smythson (c.1535–1614), for Bess of Hardwick, it successfully integrated the most notable characteristics of 16th-century British architecture – symmetry, ingenious architectural “devices,” and abundant use of glass – and incorporated diverse stylistic influences. Its symmetrical layout derives from Southern Renaissance prototypes; its tower and large grids of glass reflect the native Perpendicular Gothic tradition; and its interior ornament including obelisks and strapwork is modeled on examples published in Northern European pattern books.

Hardwick's interior layout and decoration, progressing from large, formal spaces, which visually trumpet familial status, to intimate chambers identifying their inhabitants' particular tastes and royal loyalties, reflect an aristocratic lifestyle of continuous ceremony and symbolic reference. As the great entrance hall includes an enormous plaster overmantel detailing the Hardwick family's coats-of-arms and coronets, so the high great chamber on the second floor includes a colorful plaster frieze depicting the goddess Diana and a court of animals – a symbolic reference to Elizabeth I. To complement the permanent surface decoration and for warmth, chamber walls were generously hung with tapestry series, floors were covered with rush matting, and table surfaces and bedsteads were adorned with expensive textiles. Otherwise the rooms were sparsely furnished and all the furniture – seating, tables, beds, buffets and cupboards – was arranged against the walls.

British interiors demonstrated an increasingly sophisticated assimilation of Italian Renaissance ideals – filtered through the work of Northern European designers – through the first part of the 17th century, and a growing dependence on French Baroque during the second. As the last vestiges of a peripatetic medieval lifestyle disappeared, an interest in achieving harmonious, unified interiors developed. Architects embraced classical principles of order and symmetry, blended with elegant French-inspired ornamentation and decorative touches. Mobility and symbolic ceremony were replaced by an emphasis upon comfort and aesthetic delight.

The introduction of new forms of furniture and the increased use of upholstery reflected these developments. New furniture forms – massive beds, elaborate buffets, cabinet-on-stands, writing-cabinets, and enormous candlestands – became more delicate and graceful, while upholstery – including silk,

Britain: Painted Hall, Chatsworth House, Derbyshire, 1690s

wool, leather, and tapestry wall hangings, bed and window hangings, and coverings for seat-furniture, tables, and floors – created soft, sumptuous effects.

By the 1620s, with the assimilation of Italian sources such as Palladio and Scamozzi, a sense of order, regularity, and discipline became the defining feature of larger domestic buildings. In his *Elements of Architecture* (1624), Sir Henry Wotton asserted that “Commoditie [convenience], Firmness and Delight” were the central elements of a successful home. Most crucial was a coherent progression of rooms, or specifically chambers and antechambers, arranged *enfilade* or in a row, which created interior vistas through aligned sequential rooms. This arrangement, derived from French examples, remained a favorite in Britain until the mid-18th century.

Upholstery played an important role in achieving a unified sequence within *enfilade* chambers. Typical furnishings included: seat-furniture, such as X-frame chairs with woodwork entirely masked by velvet or damask, “farthingale” chairs with seats and back-rests covered in leather or “Turkeywork,” and Dutch chairs with high splat backs and rush seats; bedroom tables, covered with carpets and lace-adorned linens; and box-like bedsteads with flat testers, finials, and rich, heavy drapery. Pictures – portraits, maps, engravings – hung on top of wall coverings, and large cupboards dressed with silver and placed in dining rooms, furthered enhanced the lavish effect.

The combination of uniform architectural elements with extravagantly upholstered, French-inspired interiors reached a highpoint in the redecoration of Ham House and various of the buildings designed by the architect Inigo Jones (1573–1652). When the State Rooms at Ham House were refurbished in the late 1630s, the North Drawing Room was decorated entirely in white satin, embroidered most probably in gold, which matched the white and gilt paneling and radiated lightness, vibrancy, and glitter. Inigo Jones, the English master of classical architecture, was much influenced by Italian sources, and his interior ornament, including chimneypieces and ceilings, was derived from contemporary French designers such as Jean Barbet and Jean Cotelie. Jones’s versatility as a designer and his successful integration of Italian and French elements won praise from royalty and he received commissions from Queen Henrietta Maria and James I, at Somerset House (1626), St. James’s (1629–31), the Queen’s House, Greenwich (1630–38), Oatlands (1636), and Whitehall (1630–38).

The restoration of Charles II in 1660 heralded the beginnings of the full-blown Baroque style and the imitation of Dutch and French decorative schemes. French designs, in particular, were extremely influential, and were much in demand by Royalists who had embraced Continental habits and tastes while in exile. And the Fire of London in 1666, which destroyed 10,000 Tudor buildings, meant that the new style was not exclusively confined to court circles. Simplified versions of French Baroque furniture – light, elegant, and commonly veneered with walnut – replaced much of the furniture that had been destroyed.

The third quarter of the 17th century, saw the introduction of Dutch-influenced floral marquetry, chests-of-drawers and cabinets on turned legs, chairs with caned seats, silver pieces embossed with floral garlands, Delftware, and imported Chinese and Japanese porcelain. But in spite of the new king’s

Dutch origins, and the arrival of Dutch cabinet-makers such as Gerrit Jensen, following the accession of William and Mary (reigned 1688–1702), French styles began to dominate British court design and a taste for French-styled gilt gesso side-tables with pillar legs, scrolled stretchers, and elaborate pendant aprons, tall chandeliers of carved and gilt wood, and chairs with cabriole legs and tall elaborately-carved backs emerged. This fashion for all things French reflected not only the fame of Versailles as pinnacle of European artistry and taste, it was also greatly encouraged by the influx of Huguenot craftsmen who departed France after the revocation of the Edict of Nantes (1685), and the success of the Franco-Dutch immigrant architect-designer Daniel Marot (c. 1663–1752).

Throughout the period, furniture progressed beyond its earlier oaken solidity and became more architectural in appearance, with sculptural carving, and vigorously ornamental surface decoration. Many designs incorporated lacquer, japanning, highly-polished veneers, and seaweed marquetry (suggesting French Boulle-work) to enhance surfaces. Tall, Marot-derived beds, as exemplified by the state bed at Melville (1685), had elaborate testers and cornices, and were richly draped with costly fabrics and trimmings. Elsewhere, the demand for stylish, comfortable furnishings for less formally decorated chambers led to the development of new types of furniture: the day-bed, sofa, wing-chair, free-standing toilet mirrors, and the fall-front writing cabinet or bureau.

A growing desire for opulence was met by the production of luxury items such as silver-coated furniture, and immense silver toilet sets, and by the increased use of gilding on woodwork, in particular carved Baroque bases for japanned or lacquer cabinets. English craftsmen and importers also responded to a new interest in the exotic: silversmiths produced Chinoiserie pieces and cabinet-makers mastered japanning. The English East India Company (established 1600) imported increasing quantities of Indian chintz and *pintados* (painted cottons), Japanese lacquer, and Chinese porcelain.

Overall, British Baroque interiors under the reign of James II and William and Mary were therefore more magnificent, yet at the same time more convenient than those in earlier great houses had been. Their design and decoration were still guided by the grand *enfilade* of chambers and the formal placement of furniture against walls, but a new emphasis on the use of rooms for specific purposes, such as dressing and dining, encouraged the introduction of new types of furniture. Displays of silver plate and porcelain became common. Similarly, mirrors, although still very expensive, played a more prominent role in decorative schemes. The “Triad” furnishing suite, consisting of a table, looking-glass, and pair of candle-stands, became a popular feature in grand interiors as did the liberal use of upholstery on walls, beds, and seat-furniture. Windows, which in Tudor times had generally had shutters, were now invariably hung with curtains.

The leading carver during the late 17th century was Grinling Gibbons (1648–1721). Gibbons’s work exemplified the rich, sculptural nature of Baroque ornament, and he created paneling, picture frames, and overmantels with fluid, detailed carved festoons of flowers, leaves, and fruit. Exceptional Gibbons commissions include Petworth (1692), Burghley House (1682), and Kensington Palace (1691–93). He also worked with Christopher Wren on the redecoration of

Britain: *A Family in a Palladian Interior*, by Josef Nollekens, 1740 (Fairfax House, York)

William and Mary's State Apartments at Hampton Court Palace (1689–1702) creating some of the most sumptuous interiors of the period. Elaborate red damask and gold-trimmed upholstery was used to cover seat-furniture, windows, the king's bedstead, and the Privy Chamber canopy. Gilded and marbled-topped furnishings, all related to Marot designs and produced by cabinet-makers such as Gerrit Jensen, Thomas Roberts, and the Huguenot Jean Pelletier, were arranged against tapestry-covered walls. The overall effect was almost overwhelming in its use of three-dimensional ornament and rich, warm upholstery, and it represented the apex of the British Baroque style.

Outside of Court circles, many 17th-century interiors were quite plain and sparsely furnished as is suggested by an engraving of Samuel Pepys's library (1693) which shows a room lined with bookshelves but containing almost no other furniture or decoration and a plain wood floor. Provincial and less wealthy consumers were unable or possibly unwilling fully to embrace the extravagances characteristic of Baroque taste. Naïve display slipware by Thomas Toft (d.1689), incorporating

subjects such as Adam and Eve and Charles II hiding in the oak tree, was very popular among the middle classes, which perhaps indicates a distaste for the foreign grandeur associated with the Court.

The increasing confidence of British design during the 18th century mirrored the country's burgeoning expansionist ambitions and growing economic might. The relationship between Britain and the Continent became more equal as British designers began influencing interior fashion in both Europe and the North American colonies. They continued to borrow from historical sources and French styles, but they reinterpreted and mixed these elements in new and trend-setting ways. Finally, increased travel and the bilingual publication of popular pattern books, by, for example, Thomas Chippendale, Ince & Mayhew, the Adam brothers, and George Richardson, ensured the wide international dissemination of British ideas.

The various styles of this century have been classified in three ways: by monarch and period (e.g., Georgian and Queen Anne); by style or movement (e.g., Palladian, Rococo, Chinoiserie, Gothic and Neo-Classical); and by architect or

upholsterer (e.g., Adam, Chippendale, Hepplewhite and Sheraton). Many of the leading architects and designers employed a variety of styles but an overriding concern for comfort and convenience defined interiors throughout the century. From the 1720s, there emerged a desire for smaller spaces better-suited to privacy, informal entertaining, and leisure pursuits such as cards and billiards. The use of dark woods such as mahogany, and the introduction of carpets and wallpapers further enhanced the warmth and intimacy of interior spaces, and architects additionally enlivened public and private rooms with elaborate wall and ceiling ornament in painted stucco and papier-mâché.

Subtle reinterpretations of earlier styles and shifts in furnishing practice more than bold stylistic innovation defined the reign of Queen Anne (1702–14). Rejecting elaborately-carved Baroque-style decoration and labored japanning, designers moved gradually towards greater simplicity. Cabinet-makers produced sleeker, more sophisticated forms incorporating stereotypical Queen Anne features such as the cabriole leg, curved chair backs, and smooth walnut surfaces. Perhaps to counterbalance this trend, the quality and quantity of objects – such as porcelain figures, vases, garnitures, and jardinières – increased. These were displayed on cabinets-on-stands, built-in cupboards, and overmantels. New furniture pieces, such as the *fauteuil de commodité* and *commode*, also emphasised the ideals of comfort and convenience.

By the 1720s, the Palladian style was in fashion. Strongly influenced by the classical ideas of Andrea Palladio and Inigo Jones, Palladianism's chief exponents adopted strict symmetry and minimal ornament in the design of exterior architecture. Palladian interiors, by contrast, were often sumptuously decorated, and included furnishings inspired by 16th- and 17th-century Italian prototypes that also incorporated elements of the provincial Franco-Dutch and late French Baroque styles that had originated during the last years of Louis XIV's reign. Palladian designers thus created a new amalgamation of late Renaissance architecture and highly-ornamented Baroque rooms.

The movement's high profile facilitated the spread of its ideals. Lord Burlington (1694–1753), who purchased Jones's Palladio drawings around 1720, and the architect Colen Campbell (1676–1729) initiated the cult of Inigo Jones. Their enthusiasm inspired other designers such as William Kent (1686–1748), Lord Burlington's protégé and the movement's most eminent designer, and John Vardy (d.1765). Key texts in disseminating Palladian doctrines included Kent's *Designs of Inigo Jones* (1727), William Jones's *The Gentleman's or Builder's Companion ...* (1739), Vardy's *Some Designs of Mr. Inigo Jones and Mr. William Kent* (1744), Batty Langley's *The City and Country Builder's and Workman's Treasury of Designs* (1740), and Isaac Ware's *Designs of Inigo Jones and Others*.

Colen Campbell's Wanstead House (1720), set the pattern for grand interiors for the next thirty years, and was the first large house built and decorated in the new Palladian style. By 1730, William Kent was producing even more splendid Palladian interiors – rich in stucco work, painted decoration, carved and gilt wood, and enormous marble chimneypieces – exemplified by his work for Lord Burlington at Chiswick House (late 1720s–36), and his designs for Sir Robert

Walpole's Houghton Hall (c.1730). Kent's ornamentation was massive in scale and ebullient in spirit, incorporating motifs such as pediments, cornices, lion masks and paws, acanthus leaves, and swags derived from architecture or antique sculpture. His designs for doorcases and chimneypieces derived from Inigo Jones but his furniture was inspired by 16th- and 17th-century Roman and Florentine prototypes. Executed by leading cabinet-makers such as William Vile (1700–67) and Benjamin Goodison (d.1767), his furniture was massive and architectural. It included gilt side-tables and pedestals with thick scroll supports and decorative carvings of festoons, curling foliage, classical masks, putti, and gigantic shells; chairs with deeply carved legs and arms; and bedsteads, with shell-surmounted heads, covered in damask.

The a-tectonic and asymmetrical Rococo style was never embraced as fully in England as it was on the Continent, and British designers used it mainly in surface ornament rather than for whole interiors. Nevertheless, they developed a comprehensive and discernible vocabulary which included naturalistic ornament such as plant, bird, animal, and human imagery, splashing water, *rocaille* or rockwork, shellwork, fluid S-shaped curves, bright colors set off by white and gold, and copious use of mirrors. It was particularly well-suited to the design of objects, and its light and fanciful forms, together with its association with the sophisticated manners of the French court, and the publication of several useful Rococo pattern books ensured the style's wide diffusion in the mid-18th century. Matthias Lock's *A New Drawing Book of Ornaments* (1740), *Six Sconces* (1744), *Six Tables* (1746) and *A New Book of Ornament* (1752) served as standard Rococo design sources for cabinet-makers, silversmiths, and other makers of interior furnishings. Thomas Chippendale's *The Gentleman and Cabinet-Maker's Director* (1754) – an invaluable guide to genteel taste in London in the 1750s – further illustrated and inspired both standard Rococo furnishings and those diversified with playful Chinoiserie and Gothic elements. Such books were widely distributed, thereby guaranteeing the extensive acceptance of Rococo elements within British interiors.

At its most successful, the British Rococo possessed animated, rhythmic, sculptural qualities. Notable examples include: Paul de Lamerie's (1688–1751) fantastic silverwork; Spitalfields' sumptuous embroidered silks of the 1750s; Isaac Ware's French-styled Rococo interiors at Chesterfield House (1740s); John Linnell's chimneypiece and overmantel designed for Lady Coventry's dressing room at Croome Court (1758); and the fluid, richly-detailed Rococo display-pieces Chippendale produced for the Earl of Dumfries (1759–66). An exceptional all-embracing Rococo interior is Claydon House, Buckinghamshire (1757–71), designed by Luke Lightfoot, whose capricious stucco ceiling, wall, and overmantel work created a unified effect rare in British design.

Chinoiserie elements were also often incorporated into Rococo pattern books and interiors. The style became fashionable in Britain in the 1750s reflecting not only the growth of the British Empire, but also the increased exposure of British designers and consumers to influences beyond Europe. Yet, 18th-century Chinoiserie differed from its earlier 17th-century counterparts in two ways. First, it appropriated novel forms and ornament in addition to exotic surface decoration such as

Britain: drawing of Earl of Derby's house, by Robert Adam

japanning. Second, designers attempted more accurate renditions of oriental subjects. Lock and Chippendale pattern books illustrated how to integrate oriental ornament within furnishings, while William Chambers's *Designs of Chinese Buildings, Furniture, Dresses, Machines and Utensils* (1757) stimulated the incorporation of correct representations of Chinese elements within other areas of British design. The acceleration of trade with the Far East also galvanized the use of genuine oriental wares, such as porcelain, lacquerwork, screens, fans, painted silks, and wallpaper, and these elements were blended with Rococo and Chinoiserie ornament within fashionable mid-18th century interiors.

William Linnell (d.1763) and Thomas Chippendale (1718–79) were leading exponents of the Chinoiserie style. Linnell designed carved decoration furnishings for the interior of a Chinese pleasure pavilion in the grounds of Woburn Abbey in 1749. He also provided furnishings for a Chinese-style bedroom at Badminton House (1752). This interior, hung with oriental wallpaper, contained a spectacular pagoda-topped bed with dragon finials, a chimney-glass, eight lattice-pattern chairs, a commode, a dressing table, and two pairs of standing shelves, all japanned en suite in black, red, and gold.

Chippendale skillfully blended picturesque Chinese elements with Rococo conceits, assimilating themes from Darly and Edwards's *A New Book of Chinese Designs* (1754) and creating designs that were more varied than those of either Lock or Linnell. Exceptional examples of Chippendale's Chinoiserie furniture were produced for Dumfries House, Scotland, where he supplied a pair of oval pier glasses, featuring a canopy that borders a bust of a mustachioed Chinese man, and a pair of gilt girandoles, Rococo in effect but Chinese in ornament with a Chinese man and ho-ho bird.

The first phase of the Gothic Revival surfaced in the 1750s and 1760s and was manifested in two parallel strands. The first of these involved leading designers such as Chippendale who adopted elements from the Gothic vocabulary alongside Rococo and Chinoiserie motifs as a means of introducing diversity within interiors. Their work reflected consumer demand for fanciful ornamentation more than a committed desire to create a genuinely Gothic effect. Its principal outlet was scrollwork ornament, patterned in cusps, ogees, lancets, and other shapes borrowed from Gothic tracery, on furniture.

The second strand of the Gothic Revival was more Antiquarian in character and involved direct borrowing from

historical sources, the use of real medieval objects, and the rejection of popular design forms. Horace Walpole's Strawberry Hill (1747–96), a model for subsequent Antiquarian interiors of the late 18th and early 19th centuries, featured stained glass, carved woodwork and stone fragments, an armor collection, Gothic-inspired decoration with *trompe-l'oeil* wallpapers imitating stucco and tracery, and ancient and modern Gothic- and Elizabethan-styled furniture. Strawberry Hill's Holbein Room, decorated in purple and white with Gothic papier-mâché ceiling ornament, was a haunting divergence from mainstream Rococo, Chinoiserie, and Neo-Classical design.

The Neo-Classical style emerged in Britain around 1770 and dominated design in various guises until the 1820s. It grew out of French design of the 1750s which emphasized ornament directly inspired by the example of the ancient Roman interiors excavated at Herculaneum and Pompeii. But it rapidly developed a uniquely British character and soon became the preferred style for both public and private commissions. Designers adorned every aspect of an interior – from fireplaces to ceiling patterns – with classical ornament so as to achieve a unified and harmonious effect, and the overall impression of such rooms was of a formal but colourful reverence for antiquity. The movement's most important designers were the architects Sir William Chambers, James "Athenian" Stuart, Robert Adam, Henry Holland, and Sir John Soane, and the cabinet-makers George Hepplewhite and Thomas Sheraton. Upholsterers, such as Ince & Mayhew, John Linnell, and Thomas Chippendale, immigrant marquetry masters such as Christopher Fuhrloh and Pierre Langlois, and the ceramics manufacturer Josiah Wedgwood also played significant roles in realising Neo-Classical schemes.

William Chambers (1723–96) produced designs that, although lighter and more measured in ornament, bore a striking resemblance to the Palladian interiors of Kent and Vardy. The work of James Stuart (1713–88), co-author with James Revett of the influential archaeological sourcebook *The Antiquities of Athens* (1762), was by contrast quite severe and resembled designs associated with the French *goût grec*. Stuart's interiors for Spencer House, London, begun in 1759, demonstrate an eclectic, partly Grecian but mainly Roman-inspired, style which appears somewhat oppressive when compared with later work by Robert Adam. Stuart's furniture reveals an obsession with classical ornament and an aptitude for appropriating design from Roman temples for 18th century household use.

The Scotsman Robert Adam (1728–92), was Britain's foremost Neo-Classical architect, designing decorations, ornament, furniture, textiles, architectural features and interior arrangements, and creating a style (in partnership with his brother James) which swept through fashionable society during the 1760s and 1770s. Robert trained with the Italian architect and engraver, G. B. Piranesi, and the French architect C.-L. Clérisseau, in Rome, but his style developed in a less solemn manner than that of his French contemporaries. He used classical prototypes for architectural design and a full repertoire of classical motifs – swags and ribbons, fluting and paterae, ram's heads, sphinxes, griffins, chimeras, Greek key patterns, and Vitruvian scrolls – to create buildings and interiors that were wholly Neo-Classical in their forms, ornament,

and restraint. He also enhanced the classical effect through a dynamic integration of materials and colors – in painted walls and ceilings, and surfaces such as marble and *scagliola* table tops and floors, and in gilding and elaborate metal door and furniture mounts. And he favoured grotesque decoration, incorporating medallions, rectangular-framed relief panels, arabesques and scrollwork that were inspired by ancient ruins and that enjoyed enormous popularity on the Continent. A fine example of Adam's grotesque interiors is the Etruscan room in Osterley Park (1776).

Two of Adam's most magnificent buildings were Syon House, begun in 1761, and Kedleston Hall (1758–77). Syon's great hall, with cream-white walls and a black and white marble patterned floor, epitomizes the classical ideal of pure, restrained ornament. Niches with classical sculpture surround the hall, stucco ornament of swags and medallions adorn the ceiling and walls, and Doric columns frame the doorcases. By comparison, the whole of Kedleston Hall reverberates with color – blue, green, yellow, and red on walls, ceilings, furniture, and upholstery, abundant gilding, *scagliola* flooring (whose design corresponds to ceiling stuccowork), and painted grotesque ornament.

The late Neo-Classical style – occasionally referred to as Hepplewhite – involved a shift towards greater simplicity and decorative refinement which was accelerated by popular books such as George Hepplewhite's *The Cabinet-Maker and Upholsterer's Guide* (1788) and Thomas Sheraton's *Cabinet-Maker and Upholsterer's Drawing Book* (1791, 1794). Hepplewhite (d.1786) demonstrated a union of elegance and utility through the simplification of Adamesque taste and the modification of early French Neo-Classicism; Sheraton (1751–1806) promoted delicate rectilinear forms and the highlighting of woods. Both featured flat, stylized Neo-Classical ornament – urns, medallions, paterae, swags, and pendants – and common features of furniture were bow- and serpentine-fronted chests and oval, heart-shaped, and shield-back chairs. Carlton House, created by Henry Holland (1745–1806) during the 1780s for the Prince of Wales, employed bold, large-scale ornament and epitomized the late Neo-Classical style. The style also had its practical side, and both Holland and Sir John Soane (1753–1837) designed furniture that was built into the architectural structure.

The architecture and interiors of many medium-sized villas and town houses during the late 18th and early 19th centuries were influenced by Picturesque theories, which celebrated the freedom, informality and irregularity of nature. These theories encouraged more informal living arrangements and asymmetrical house plans. Most importantly, they broke with the tradition of furniture being ranged around the perimeter of the room and promoted comfortable, irregular groupings in its center that facilitated conversation and less formal social intercourse. Publications which promoted this more relaxed style of living included Malton's *An Essay on Cottage Architecture* (1798), Bartell's *Hints for Picturesque Improvements in Ornamental Cottages* (1804), and Papworth's *Rural Residences* (1818).

Nineteenth-century design broadly separates into three periods, which while stylistically distinct, share commonalities of purpose and effect. The classically-inspired Regency phase of the early 19th century generally extended the stylistic prior-

Britain: drawing room from *The Decoration and Furniture of Town Houses* by Robert W. Edis, 1881

ities of 18th century “tasteful” Neo-Classicism. Victorian design, which spanned the period from the 1820s to the 1880s, adopted a broader range of revivalist motifs and consistently emphasized richness and texture. Finally, the mid-to-late 19th century reform movements argued strongly against the prevailing eclecticism and called for simpler treatments and a more “honest” approach to materials and design.

Throughout the century, however, there was greater emphasis upon the idea of home as a secluded and comfortable haven from the hazards and pressures of the outside world, as well as upon densely furnished schemes and conspicuous consumption. The century also saw the emergence of new markets in the form of the newly prosperous and fashion-conscious middle classes. Within this context, interior decoration became a major industry, supported by a vast literature of journals and home manuals that promoted popular styles and discussed design principles. Some of the best-known of these books were J.C. Loudon’s *An Encyclopaedia of Cottage, Farm and Villa Architecture and Furniture* (1833; re-issued until 1867), Robert Kerr’s *The Gentleman’s House* (1864), Charles Eastlake’s *Hints on Household Taste* (1868) and Macmillan’s *Art at Home* series (published between 1878 and 1880). The widespread success of these books guaranteed the broad dissemination of different styles.

Reacting against the excessive ornamentation within Adamesque interiors and the spindly elegance of Hepplewhite, Regency design was popular from the 1790s to the 1840s, and satisfied a taste for plain, pure surfaces, a reduction in the quantity of relief ornament, a reliance on painted decoration, and the use of furniture whose forms were based on antique prototypes. Greek Revival elements served as primary decoration in Regency interiors; but ornament and form derived from Chinese, Indian, Egyptian, and other exotic sources were also frequent embellishments. The style first appeared in works by Henry Holland, C.H. Tatham, Thomas Sheraton, and Sir John Soane. It reached its zenith in the work of Thomas Hope (1769–1831) whose book *Household Furniture and Interior Decoration* (1807) was extremely influential and whose designs were widely adapted and popularised by commercial cabinet-makers such as George Smith (d. 1826).

Hope’s designs for furniture were strongly archaeological in flavor and drew upon his knowledge of ancient Greek, Roman and Egyptian sources. Other furniture, although less authentically antique, nevertheless featured sabre legs, carved acanthus scrolls, inlaid palmettes and lion-paw feet, prompting Sir Walter Scott to remark in 1828, “An ordinary chair, in the most ordinary parlour, has now something of an antique cast – something of Grecian massiveness, at once, and elegance in its forms.”

Regency’s willingness to overlay formal classical structure with different stylistic and historical motifs culminated in the extraordinary interiors created by John Nash, Frederick Crace and Robert Jones for George IV at Brighton Pavilion (1815–23). The exterior of this building is Indian in style – featuring Picturesque groupings of minarets, porticoes, pillars, and Vathek caprices – but the symmetrically arranged interiors exude a dignified, differentiated exoticism. Indian, Chinese, and Egyptian quotations that include palm-tree columns, dragon-capped chandeliers, couches modeled after Egyptian boats, bamboo furniture, and a painted representation of a gigantic plantain tree, are coupled with an extensive use of mirrors and dramatic color schemes, and create an effect stunning in its richness.

High Victorian interiors can be broadly separated into Gothic Revival, Rococo Revival, and Renaissance Revival schools, but designers borrowed freely and simultaneously from each of these styles and others including Antiquarian, Neo-Classical, and Eastern-inspired design. The use of diverse patterns and textural embellishments on architectural structures, furniture, and all other decorative devices further complicated the visual impact that resulted from this stylistic mixing. Thus, rather than seeking unified effects, decorators and consumers attempted to balance varied color, pattern, and texture within comfortable, visually-stimulating rooms. To this end, the Victorians developed a uniquely British design movement characterized by rampant eclecticism.

The Victorian Gothic Revival developed as a nationalistic response to the foreignness of the classically-inspired Neo-Classical and Regency styles. Gothic, by contrast, was perceived as a native, ecclesiastical style and it had strong moral overtones. A.W.N. Pugin (1812–52), the style’s major proponent, spearheaded a Reformed Gothic movement which insisted on the correct use of authentic medieval ornament and designs, honesty in construction and truth to materials. His

ideas were disseminated in his published works, notably *Gothic Furniture in the Style of the 15th Century* (1835), *Contrasts; or, A Parallel Between the Architecture of the 15th and 19th Centuries* (1836; 1841) and *The True Principles of Pointed or Christian Architecture* (1841).

While designers from many different schools borrowed Gothic elements, Pugin, and the second generation of Gothic Revivalists such as William Butterfield, George Edmund Street, G.F. Bodley, and Philip Webb, created stylistically-uniform Gothic buildings with rambling, informal ground-plans. They revived the medieval Great Hall, which served as a seat of "old English hospitality" and functioned as the home's heart, to link other rooms and to provide a communal entertainment space, and used bold, chunky furniture such as Pugin's Glastonbury chairs and his massive cabinets with tracery and large brass hinges. Wall hangings of gilt leather with embossed patterns and stained glass in windows enhanced the Gothic effect. Notable Pugin interiors include Scarisbrick Hall (from 1837) and Eastnor Castle (from 1849). William Burges's (1827–81) Cardiff Castle (1869–81), represents the culmination of the Victorian Gothic Revival in its fantastic mix of Moresque detail and medieval painted decoration, carving, gilding, paneling, coffering, tiling, and architectural ornament.

Despite its morally superior stance, Gothic was never widely popular as a domestic style. Far more successful was the Neo-Rococo or Louis Quinze style, whose rounded forms and elaborate ornament were better-suited to the new priorities of comfort and display. Popular Neo-Rococo designs included heavily-stuffed, deeply-buttoned, and elaborately-trimmed furniture like balloon-back chairs with cabriole legs and curvaceous sofas. Ornament was similarly cumbrous and frequently included dense, bulging, sinuous foliage adapted from the acanthus ornament of the early 19th century. While originally for the very wealthy and embodying political connotations of the *ancien régime*, this plush domestic style dominated many drawing rooms and/or boudoirs – the feminine spaces of middle-class homes – by the 1840s; examples of the style within wealthy homes are Benjamin Dean Wyatt's (1775–1852) Belvoir Castle (c.1825–30), and Stafford House (c.1826–33). By the 1860s, the Rococo had developed into the *Louis Seize* revival, the High Victorian style most often associated with interiors brimming with densely-massed objects and ornament.

Another immensely popular style of the 1870s and later was the Renaissance Revival which had first emerged in the 1830s when it was used by Prince Albert for Osborne House on the Isle of Wight. This movement embraced a variety of revivalist idioms – many of which were not Renaissance-based and none of which were pursued with the fervor of the Reformed Gothic – and by the late 19th century, Victorian Renaissance interiors incorporated motifs from the Renaissance, Neo-Classicism, Louis Quatorze Baroque, Louis Quinze Rococo, and renewed Pompeian, Grecian, Turkish, and Egyptian styles. This "Free Renaissance" style, as it was known, also favored the use of different styles within different rooms. For instance, dining rooms or halls were typically "old English" and were decorated with paneling or leather wallhangings and pictures such as portraits. Drawing rooms, regarded as a more feminine domains, were more delicate in appearance and featured French or 18th-century Neo-Classical styles and soothing

watercolors and landscapes. Reproduction furniture of virtually every period filled all parts of the home.

The Arts and Crafts Movement, the principal reform movement of the mid-to-late 19th century, represented a reaction to this eclecticism and a critique of the degeneracy of much mass-produced industrial design. Inspired by the writings of John Ruskin (1819–1900) and William Morris (1834–96), it championed the revival of obsolete craft skills, the use of natural materials and an emphasis upon simpler, vernacular forms. Though the name itself stemmed from the Arts and Crafts Exhibition Society founded in 1888, the movement grew out of the widespread critical dissatisfaction with the objects shown at the Great Exhibition of 1851. Its principles gained broader acceptance in the 1860s with Charles Eastlake's *Hints on Household Taste* (1868), through the work of Morris, Marshall, Faulkner & Company (founded in 1861, became Morris & Co. in 1875), and with the establishment in 1857 of the Victoria and Albert Museum whose mission was to promote standards of "good" design. Under its auspices, various design schools and design guilds were born, including the Century Guild (1882), Guild of Handicraft (1887), and Art-Workers' Guild (1884).

Although Arts and Crafts objects and interiors consistently emphasised fine workmanship, good design and native forms, individual designers and architects involved with the movement developed their own priorities and styles. The Aesthetic Movement, for example, championed by E.W. Godwin (1833–86), was strongly influenced by the lightness and elegance of Japanese forms, while the Queen Anne Revival, spearheaded by Richard Norman Shaw (1831–1912) and William Eden Nesfield (1835–88), drew on the vernacular traditions of the late 17th and early 18th centuries and favoured red brick, asymmetrical structures with a preponderance of Picturesque features such as tall chimneys and elongated windows. Queen Anne furniture was modelled on 18th-century prototypes and included tall display cabinets and corner cupboards featuring intricate mouldings, turned legs and stretchers, and gilt gesso naturalistic ornament. Designers such as Christopher Dresser (1834–1904), and C.F.A. Voysey (1857–1941) worked even more independently. Dresser produced designs for ceramics, wallpapers and textiles as well as furniture that explored the use of semi-abstract botanical and oriental forms. Voysey used a bright, light palette and simple unconventional patterns on his wallpapers and textiles and designed a range of simple, craftsmanlike furniture for cottage-style interiors such as those for his own house, The Orchard, Chorley Wood (1899).

Arguably the most celebrated Arts and Crafts interiors were designed by Morris & Co., the decorating firm founded by William Morris in association with Philip Webb (1831–1915), Dante Gabriel Rossetti (1828–82), and Edward Burne-Jones (1833–98), and others in 1861. The company produced solid oak furniture, wallpaper and textile patterns based on natural and historical sources, embroidered tapestries and bed hangings, and medieval-style stained glass. Their work was used for both important public commissions and town houses, for example the state rooms at St. James's Palace (1880–82) and the decoration of Aleco Ionides' house, 1 Holland Park (from 1880), as well as in more rustic settings like Philip Webb's Great Tangle Manor (1885–91) and Standen (1891–94)

Britain: library, Eaton Hall, Cheshire, c. 1882

where the interiors adhered more closely to the aesthetic of simplicity that characterized the later Arts and Crafts ideal. Moreover, Morris & Co.'s activities as a retailer and manufacturer exercised a strong influence on progressive upper-middle class tastes.

"New Art" or Art Nouveau emerged in the 1890s. The style's distinguishing features were its use of energized, swaying lines, deliquescent human figures, and tentacle-like flower and leaf motifs in surface decoration and eccentric, organic, curving forms. A watered-down version of the style was actively promoted by commercial manufacturers such as Liberty's (established 1875) which produced reasonably-priced furniture, textiles and wallpapers derived from the Arts and Crafts designs of artists like C.R. Ashbee, M.H. Baillie Scott, Archibald Knox and Voysey. Art Nouveau's most celebrated British exponent was Charles Rennie Mackintosh (1868–1928) but Mackintosh's style was more closely affiliated with that of the Viennese Secession and the International Modern Movement than with the work of his British contemporaries.

Born and trained in Glasgow, he combined Scottish vernacular, Art Nouveau, and industrial functionalism in his architecture and furniture. He delighted in rectilinear formal effects and rounded, squat decoration such as his ubiquitous rose. His furniture designs evolved into square, heavy forms like the high-backed chair with a pierced oval backrail, used in the Tea Rooms at Argyle Street, Glasgow (1897–98). Mackintosh's interiors, notably those in the Glasgow School of Art (1896–99; 1907–09), Hill House at Helensburgh (1902–04) and multiple furniture designs, also prioritized stark architectural effect over comfort and convenience, and in his concern for design as artistic statement, he foreshadowed the interests of the 20th century.

The major developments in British design in the 20th century can be broadly classified as the continuation of the Arts and Crafts Movement, the development of the English Country House style, and emergence of the Modern Movement. The aesthetic characteristics of these programs ranged respectively from simple, rustic forms, to chintzy

domesticity to functional minimalism. While individual designers created unified interiors in each of these styles, the mass of consumers selected elements from one or more movements and integrated them within a broader interior framework that included historicist ornament and antiques. The growth of retail chains devoted to both modern and revivalist designs further enabled customers to choose from various styles and to create interiors that reflected personal taste rather than a consistent style.

The Arts and Crafts ideals of high-quality workmanship and simple, straightforward design were perpetuated in the early part of the century by the designer and retail-store owner Sir Ambrose Heal (1872–1959) and the architect Edwin Lutyens (1869–1944). Heal's shop specialised in simple cottage-style furniture and freshly coloured textiles and he disseminated his ideas through publications such as *Plain Oak Furniture* (1898) and *Simple Bedroom Furniture* (1899) until the 1930s. Lutyens's designs, particularly those for Castle Drogo (1910–32), were also grounded in Arts and Crafts principles, but included additional ornamentation and touches of playful complexity to create more mannered effects.

The work of the Omega Workshops (1913–19) reflected more Modernist principles. Inspired by the Wiener Werkstätte and founded by Roger Fry, Vanessa Bell, and Duncan Grant, the Workshops used Fauvist and Cubist forms and axioms to create furniture, carpets and textiles decorated with brightly colored flat patterns. The Workshops' most important commissions include the Cadena Café in London's Westbourne Grove (1914) and a Post-Impressionist room in the Ideal Home Exhibition (1913). While occasionally classified as Arts and Crafts due to the Workshops' organizational structure, the designs themselves clearly suggest later Modernist movements.

The first sustained break with the Arts and Crafts tradition came with the English Country House style, which emerged in the 1930s with the establishment of the interior decorating firm Colefax & Fowler. Colefax & Fowler's clientele represented a wealthy social elite many of whom were intent on decorating their stately homes in a manner that was sympathetic to the age and history of the architecture. The firm's mixture of antiques with modern conveniences, their reliance on a subtle use of "old" paint colors to highlight features such as mouldings and plasterwork decoration, their revival of historic and traditional floral textile and wallpaper patterns, and their generous use of draperies and soft upholstery, were ideally suited to this task. Moreover, they formed the backbone of design principles which have gained post-war international popularity through the work of companies like Laura Ashley whose rustic chintz-style wallpapers and textiles have satisfied a more widespread taste for nostalgia and traditional living.

An interest in historical styles and references developed concurrently with the above-mentioned styles. Antique objects and revivalist design visually reinforced values of tradition, stability, and national pride, and antique or reproduction furniture from the 17th and 18th centuries was favoured in many fashionable turn-of-the-century homes. Firms such as Heal's and Liberty's established Antiques departments to service middle-class demand and the Ideal Home Exhibition (1920) and the British Empire Exhibition at Wembley (1924) both encouraged this anti-Modernist taste. The British Empire Exhibition featured a sequence of rooms furnished in the styles

of 1750, 1820, 1852, 1888, and 1924. Popular architectural features included mock-Tudor timbered gable ends, heavy-paneled front doors, and wood-paneled halls and dining rooms.

British interpretations of international Modern Movements began with Art Deco of the 1920s and 1930s, and continued with British Modernism, Utility schemes, Pop, High-Tech and Postmodern design. But perhaps because of their foreign origins, or because of consumers' preference for cozy domesticity, none of these movements became firmly entrenched within the mass of British interiors. Rather, consumers tended to incorporate Modernist elements within rooms that were generally Country House or revivalist in style.

The British Art Deco Movement grew out of the 1925 Paris Exposition des Arts Décoratifs et Industriels and Art Nouveau. Art Deco designers rejected most historical references and used color and abstracted decoration, including motifs of chevrons, zigzags, and sunrises, as expressions of contemporaneity. Phyllis Barron (1890–1964), one of the British movement's most important textile designers, created hand-blocked fabrics of abstracted geometrical and floral patterns with Dorothy Larcher (1884–1952). Interior designer Syrie Maugham (1879–1955) juxtaposed white surfaces and mirrors. In the late 1930s, Art Deco design evolved into an extravagant, luscious style. The Dorland Hall Exhibition (1933) featured a boudoir with a glass chaise longue, silver-glass walls, and a glass floor by Oliver Hill. Suburban variations of Art Deco included bright, geometric Jazz-Age patterns for wallpapers and textiles, chunky or rounded sofas and matching armchairs covered with leather, velvet or moquette, stepped veneered cabinets and bookshelves, and geometric coloured glass light-fittings.

Modernism, developed on the Continent under Le Corbusier, Mies van der Rohe, and designers associated with the Bauhaus school, favored modern materials such as concrete, tubular steel and glass, and mass-production technology to create pure, clean, sparsely furnished interiors. Serge Chermayeff (1900–96), the leading Modernist designer in Britain in the 1920s and 1930s, revolutionized British design with his incorporation of black glass, silver cellulose, macassar ebony, and abstract patterns. Chermayeff, who envisioned the elimination of ornament in the evolution of a pure style, designed strikingly plain interiors for the BBC (1932–34). The Design and Industries Association (DIA) and government commissions such as the Council of Industrial Design and the 1932 Gorell Report on Art and Industry actively promoted this minimalist aesthetic. Their efforts, however, had mixed results, with the broader adoption of Modernist designs by commercial manufacturers occurring only after World War II.

The premise that underpinned much post-war design was that scientific and technological advances as applied to the home could improve the quality of life through labor-saving and automation. The Festival of Britain (1951), while nominally devoted to celebrating Britain and its history, actually had a pervading sense of science fiction and displayed a consistent emphasis on science and technology as the means of modernizing the workings of the home. In many Festival exhibits, molecular, crystallographic, and atomic structures served as the basis for designs for textiles and other surface decoration for glass, packaging, pottery, and furniture. The Festival Pattern Group, for example, which represented 26

Britain: Joan and David, New Bond Street, London, by Eva Jiricna, 1994

manufacturers including Wedgwood, Goodearl Brothers, Chance Brothers, and London Typographical Designers, derived their ornament from the crystallographic structures of substances such as boric acid, insulin, aluminum hydroxide, and haemoglobin.

The Festival stimulated a general interest in “Contemporary Style” design among middle-class consumers. This style fused function and ornament in a playful manner, as epitomized by Robin Day’s stackable *Hillestack* chairs and ubiquitous bold surface patterns, such as Lucienne Day’s *Calyx*, on wallpapers, plastic laminates, and carpets. “Molecules” became a widespread decorative element – found on the feet of domestic appliances and furniture, and as surface ornament – throughout the 1950s.

By the mid-1960s, London had become a major centre of the youth-oriented Pop Movement which affected fine arts, fashion, and graphic and interior design. The Independent Group was at the forefront of Pop in the 1950s and members Alison and Peter Smithson created one of the earliest Pop interiors for the Ideal Home Exhibition (1956). This futurist house included organically-shaped rooms contained within an

expendable plastic-plaster shell. Pop concepts of expendability and design pluralism challenged traditional notions of permanence and status. Designers created furniture constructed in cardboard, chipboard, and paper. Bright colors, strong geometric patterns such as targets and the Union Jack, and consumer-oriented motifs inspired by contemporary artists such as Oldenburg and Warhol decorated object surfaces. The radical youth culture of the late 1960s and early 1970s also encouraged the emergence of a psychedelic design style which drew upon the imagery and colors associated with experience of taking LSD as decorative sources. Designers blended hallucinatory motifs and colors with a variety of historical and artistic references including the illustrations of Aubrey Beardsley and Art Deco motifs and ornament. Nevertheless, the Pop and Psychedelic movements had only a marginal effect on domestic interiors through posters and other inexpensive, readily-available decorative items. Most middle-class homes retained either a revivalist, chintz, or 1950s “Contemporary” flavor.

Unlike the suggestive wit and modernity of Continental exponents such as Ettore Sottsass and the Memphis Group, much British Postmodernism, developed in the 1980s, has

revealed a concern to preserve existing structures and a renewed interest in historical ornament and traditional craft techniques. The pastiche Georgian revivals of architects such as Quinlan Terry or the "classic" designs of the furniture maker David Linley are typical of this trend. The industrial home-furnishing style, known as High-Tech, is, by contrast, more modern in appearance and has proved more marketable. High-Tech interiors have incorporated steel furniture components, graph-based wallpapers and fabrics, and bulkhead lighting. The design concepts relate to the mid-20th-century work of Charles and Ray Eames and use ready-made industrial components to create personalized, contemporary interiors. Norman Foster and Nigel Coates represent the British movement's most influential designers, and Sir Terence Conran's Habitat and Conran's stores have served as the movement's major retailers.

While modern design movements continue to evolve, variations on the English Country House style and revivalism still reigns supreme, comfort and nostalgia – a veneration for the past no matter how recent or distant – remain guiding principles. Indeed, multiplicity has characterized British interiors from the turn of the 19th century through today, and reactions to the perceived detrimental impact of industrialization and the increasing significance of the middle class has clearly encouraged the celebration of individualism and personal taste. Retail design markets serving and directing *en masse* individual consumers in the 20th century have usurped the role of the architect-designers and design professionals of the 18th and 19th centuries.

Brustolon, Andrea 1662–1732

Italian sculptor and carver

Described by Honoré Balzac as the “Michelangelo of wood”, Andrea Brustolon was one of the most celebrated Italian woodcarvers of the late 17th and early 18th centuries. Active for much of his career in Belluno and Venice, he worked in an elaborate Baroque style and executed a wide range of furniture and carvings for wealthy aristocrats and Venetian churches. His father, Jacopo, was also a woodcarver, and it was from him that Andrea received his first training. He became particularly skilled in the carving of box and ebony, both of which were hardwoods and were extremely difficult to carve. Brustolon’s mastery of these materials is further evidence of his technical prowess and skill.

A significant precedent for Brustolon’s work is the extraordinary carvings of Francesco Pianta (1632–c.1692) in the Church of San Rocco, Venice. A letter of 1677 records that Brustolon was in Venice that year and that he met the Genoese sculptor, Filippo Parodi, during the course of his stay. Some drawings of antique Roman sculptures such as the *Laocoön* and the *Farnese Torso*, now in the Museo Civico, Belluno, support the suggestion that he made a trip to Rome c.1679. Brustolon could also have seen the works of Gian Lorenzo Bernini in Rome, and the sculptor’s influence is detectable in a number of Brustolon’s works during the following years. His highly personal style was also closely linked with Venetian traditions which are reflected especially in the overwhelmingly monumental character of his sculpture. And he also appears to have been influenced by the iconographic repertory of Northern European culture which may have provided the starting point for his own fanciful compositions.

Brustolon’s figurative style is already apparent in his first documented work, the Altar of the Anime (Souls) in the Church of S. Florian in Pieve di Zoldo, near Belluno (1685–86). The wooden cone of the architectural structure is conceived on a rigorously classical foundation which is then masked by the complex interweaving of ornamental features such as curling leaves, cherubs and skulls. Two flayed telamones and two skeletons – symbols of temporal power – appear on the sides of the Altar. And the figures of two angels, carved in the round, are arranged on the cornice, crowning the central group of the Pietà.

Other sculptures are documented in the last decade of the 17th century, and Brustolon’s ecclesiastical work includes carvings for several churches and convents in the Veneto. These include the group of angels for the church of San Fermo and the *Custodia* of Saint Teodora for the Augustinian convent in Feltre, both of which date from 1695 and were carved in the Belluno workshop where he worked with his father and his brother, Paolo (1664–c.1734).

In the first years of the 18th century Brustolon received his first important commission from patrician Venetian families. One of the statues from the “Venier suite”, now in the Museo

Correr, is inscribed “1706 And.s Brustolo.s Bellu.s F.” This ensemble was produced for the Venetian nobleman, Pietro Venier, and demonstrates an exceptional technical virtuosity as well as a pleasing treatment of its subject. The suite consists of an assortment of sculpted furniture including twelve armchairs, two pedestals, several vase-stands, supports depicting Ethiopian slaves and Moors, groups of putti and caryatids, and a large group representing Hercules overcoming the Hydra with Cerberus. It was Brustolon’s most celebrated work and the carving has such an unrestrained sculptural value that the practical function of the individual elements is completely obscured.

Preparatory studies in the Museo Civico have made it possible to authenticate numerous other secular works, including frames, chairs and wall panels, that are now in private collections. However, the authorship of the two famous suites of armchairs for the Correr family (Museo Correr, Venice) and for the Villa Pisani at Strà that are traditionally attributed to Brustolon has recently been called into question. The latter group, now in the Palazzo Quirinale, Rome, consists of twelve pieces, decorated with signs of the Zodiac and various naturalistic details, that symbolise the months of the year.

Documents published by Biasuz (1969) provide details of some of Brustolon’s later works. These include two elegant angels carrying lamps in the Church of the Frari, Venice, and the Reliquary Tabernacle of Saint Innocentia made for Archbishop Antonio Polcenigo of Feltre (now in the Museum für Kunst und Gewerbe, Hamburg). Many commissions for religious institutions in Belluno followed in the last decade of his career, such as the Tabernacle for the Altar of the Rosary in the Church at Cortina d’Ampezzo (1724). Secular commissions included a box-wood group of statues on pedestals carved in low relief which were made for the Count Tiopo Piloni (1724). Once again a vivacity and freedom of invention are restored to subjects that hitherto had been strictly codified.

Brustolon’s work was highly acclaimed by his contemporaries. Indeed, such was his fame that by the time of his death in 1732 he had a large number of followers and imitators whose work is often misattributed to Brustolon himself. These imitations rarely achieve the high sculptural quality of the artist’s original works.

LUCIANA ARBACE
translated by Antonia Boström

Biography

Born in Belluno, 20 July 1662. Son of Jacopo Brustolon, a sculptor and woodcarver, with whom he first trained. Studied drawing and sculpture with Agostino Ridolfi (1646–1727), then entered the Venetian workshop of the Genoese sculptor, Filippo Parodi (1630–1702), 1677. Travelled to Rome, 1679; returned to Venice, 1680. Received commissions for suites of furniture from the Venier di S. Vio, S. Simeone and Pisani families in Venice, 1684–99. Completed the Altar of the Anime for the church of S. Floriano di Zoldo, 1685–86. Returned permanently to Belluno, where he set up a workshop with his father and brother Paolo, c.1699. In addition to decorative secular sculpture, furniture and frames, he executed much sacred sculpture for churches in Belluno and the surrounding area. Member of the Confraternità di S. Giuseppe, and Oratorio di S. Filippo Neri. Died in Belluno, 25 October 1732.

Selected Works

Brustolon's most important work is represented in the Museo Correr, and the Museo Ca' Rezzonico, Venice; the Quirinal Palace, Rome; and the Kunsthistorisches Museum, Vienna. The most comprehensive list of surviving, attributed, and lost works and earlier bibliography is in Biasuz and Lacchin 1928. Persicini 1882 has a full catalogue of works and documentary appendices.

- 1706 Venier Palace, Venice (now Museo Ca' Rezzonico, Venice; suite of sculpted furniture [the "fornimento Venier"] including 12 armchairs; 9 Ethiopian slaves; 2 dead Moors; 1 standing Moor; 2 female caryatids; the Four Seasons; the Five Elements; 2 groups of putti; 2 pedestals; group of Hercules overcoming the Hydra with Cerberus with figures of Rivers and slaves); Pietro Venier

Attributed Works

Suite of 8 armchairs (now Museo Correr): Correr family
Villa Pisani, Strà (now Quirinal Palace, Rome; suite of 12 armchairs depicting the Months): Pisani family

Buckland, William 1734–1774

American architect and carver

In colonial America, master builders, house joiners, and gentlemen were occasionally referred to as architects. Although many were distinguished for their technical expertise, ability to oversee a workforce, and basic knowledge of classical form and detail, few were architects in the strict sense of the word and fewer ventured into other areas of design. A notable exception is William Buckland, whose designs for public and private buildings and furniture in Virginia and Maryland justify his claim to the title, architect.

Buckland was born in the parish of St. Peter's-in-the-East, Oxford, England, in 1734 and trained as a joiner by his uncle James Buckland of London. On 4 August, 1755 – approximately four months after his apprenticeship expired –

Buckland signed an indenture with Thomas Mason of Fairfax County, Virginia, agreeing to serve the former's "Executors or Assigns in ... Virginia" for four years. In turn Buckland received free passage to the colonies, food, lodging, and an annual salary of £20 sterling.

Thomas Mason acted as an agent for his older brother George, a prominent northern Virginia planter who had recently begun building Gunston Hall about ten miles south of Alexandria. Although the exterior walls of Gunston Hall probably were complete when Buckland arrived in November, it is likely that he designed the portico on the "south front." The portico closely resembles a garden temple in William Paine's *The Builder's Companion and Workman's General Assistant* (1758). Both designs are based on a hexagon and have Doric friezes, broad engaged pilasters, and Gothic arches.

The floor plan of Gunston Hall is similar to many other five-bay Virginia houses. On the first storey there is a wide central hall that accommodates the stair, and provides access to four rooms of approximately equal size. Both the hall and the southwest room are almost completely within the Palladian tradition. The hall has a Doric entablature and fourteen engaged pilasters, two of which act as imposts for elliptical arches. Functioning as a support for the floor at the top of the stair, the arches have keystones with toed back mouldings, a large pendant drop, and carved spandrel appliqué. The stair has intricately carved walnut brackets and newell posts and originally had a large frieze appliqué.

Buckland's acute understanding of classical form and detail was the result of his training and his familiarity with published designs. His estate inventory included fifteen architectural design books, furniture design books, and builders' guides. He probably purchased most of the books before leaving England, but at least four were acquired after his arrival. Buckland frequently borrowed designs from these sources. The acanthus appliqué on the windows and doors in the southwest room, for example, are based on the crossette appliqué on pl. 75 in Batty Langley's *The City & Country Builder's and Workman's Treasury of Designs* (1740), a book Buckland owned.

The northwest room is one of the most fully developed interiors in the Chinese taste. Passion for Chinoiserie design was well established in English architecture before Buckland's move to Virginia, in part owing to publications such as William Halfpenny's *New Designs for Chinese Temples, Triumphal Arches, Garden Seats, Palings &c.* (1750) and George Edwards' and Matthias Darly's *A New Book of Chinese Designs* (1754). However, there is no design in these books that precisely matches Buckland's treatment of the windows and doors, which suggests that he was either working from memory or simply borrowing conventional "Chinese" details, such as scalloped cresting and imbricated consoles, from published sources. The only book in Buckland's library with similar details was Thomas Chippendale's *The Gentleman and Cabinet-Maker's Director* (1754).

For the execution of his designs, Buckland relied on local artisans. A suit for back wages filed by joiner James Brent provides information on tradesmen in Buckland's crew. On 6 July, 1763, Brent presented a list of outstanding wages and expenses incurred on Buckland's behalf including a "Pare Shoes" purchased for carver William Bernard Sears in 1759. Sears's son, Charles Lee, maintained that his father was inden-

tured to Mason and that he executed the carving in Gunston Hall. The designs of the carved mouldings, appliquéés, and other ornaments in Gunston Hall probably represent the collaborative efforts of Sears and Buckland; however, the former was entirely responsible for their interpretation in wood. Buckland and Sears also made at least four side chairs for Gunston Hall. Only a fragment of one survives, but its fret legs, carved brackets, and rail shaping are related to those of a Chinese chair illustrated on pl. 25 in Chippendale's *Director*.

Most of the interior work in Gunston Hall was completed when Buckland's indenture expired. On 8 November, 1759, Mason wrote, "I can with great Justice recommend him to any Gentleman ... I think him a complete Master of the Carpenter's & Joiners Business both in Theory & Practice." Mason's endorsement and social connections undoubtedly helped Buckland secure other commissions.

In 1761 Buckland moved to Richmond County, Virginia and settled near the town of Warsaw. By December of that year, he was working for John Tayloe II (1721–79), a wealthy planter who was either completing or remodeling his house, Mt. Airy. As at Gunston Hall, the masonry work probably was complete before Buckland's arrival. Although the interior of Mt. Airy burned in 1844, fragments of carved cornice moulding and three tables attributed to Buckland and Sears survive. The architectonic form of these tables and their carved details suggest that Buckland designed them to complement the interior woodwork in the house, much as he would have learned to do in England. One example is based on the sideboard table on pl. 38 of Chippendale's *Director*, but the large egg and tongue moulding, rope moulding, and circular fret match details in both Mt. Airy and Gunston Hall.

Buckland and Sears probably parted ways about 1765, after completing their work at Mt. Airy. Sears evidently moved to Loudoun County, Virginia and Buckland remained in Richmond County where his shop continued to produce furniture and architectural components and drawings. Between 1765 and 1771, Buckland took two apprentices and hired a "London Carver a masterly Hand." In November 1771, he and several of his tradesmen moved to Annapolis, Maryland to complete the large, five-bay townhouse that Edward Lloyd IV had recently purchased from Samuel Chase. Lloyd undoubtedly learned of Buckland from his father-in-law, John Tayloe II.

Lloyd's patronage enabled Buckland to escape the predominantly rural confines of Virginia's Tidewater region and move to a small, prosperous city during an unprecedented period of construction and renovation. At least fourteen townhouses were built in Annapolis between 1764 and 1774. Although Buckland's Maryland career lasted only three years, he has been erroneously credited with work on at least fifteen structures in the Annapolis vicinity and on Maryland's eastern shore. To date, only two houses and three public buildings can be firmly associated with his shop.

The woodwork on the first two floors of the Chase-Lloyd House occupied most of Buckland's workforce through April 1773. The floor plan features a wide central hall with an Ionic screen dividing the entrance from the stair. The stair rises from the center of the hall, divides at a landing with an ornately carved Venetian window, and terminates in a short hall with niches for sculpture. The dining room, which is the most

ornate space in the house, has doors with gadrooned surrounds with floral appliquéés in the crossettes, acanthus-carved trusses, pitched pediments with carved mouldings and frets, and Rococo frieze appliquéés with bird heads and leafage derived from a design for a stair bracket on pl. 39 in Abraham Swan's *British Architect* (1745). The windows also have gadrooned surrounds, but they rest on paneled plinths with applied garlands of fruit and flowers.

The carving in the Chase-Lloyd House is attributed to Thomas Hall, a London artisan who was indentured to Buckland. Hall ran away in December 1773, but soon returned to his master's service. Judging from Buckland's advertisements for runaway servants – primarily bricklayers and plasterers – his workforce grew considerably after his arrival in Annapolis.

Unlike Buckland's previous work, the commission that he undertook for Lloyd's neighbor Mathias Hammond in 1774 involved furnishing both interior and exterior plans and elevations. Although construction may have begun in April, Buckland's death in December prevented him from seeing its completion. Nevertheless, evidence that Buckland designed the house is found in the final account of his estate and in artist Charles Willson Peale's depiction of Buckland working on the exterior elevations and floor plan. Despite Buckland's untimely death, the Hammond house was completed as drawn. With its two-storey, five-bay central block and half octagon wings, it is one of the most ambitious townhouses surviving from the colonial period. The large southeast room on the first floor has an ornate carved chimneypiece and three windows and doors, all with entablatures with carved trusses, mouldings, and appliquéés. The latter are also based on pl. 39 in the *British Architect*, but the flow of the design and articulation of the leafage is more in the Neo-Classical taste. This stylistic shift may reflect the influence of Thomas Hall who worked in London during the late 1760s.

In addition to working on the Chase-Lloyd and Mathias Hammond houses, Buckland executed plans for a court house and prison in Caroline County, Maryland and received £25 for "expenses and services relative to the Public Building" in Annapolis. The latter may have referred to plans and elevations for the Senate Chamber in the State House. His Annapolis shop also produced a few pieces of furniture. The commissioners of the loan office paid him £16.12.6 for "one Large Double Desk" and miscellaneous repairs and his inventory listed table and picture frames.

During the 1750s and 1760s, Buckland referred to himself as a "house joiner" or a "house joiner and cabinetmaker," but in a letter written on 7 November 1772 he described himself as a "Citizen of the City of Annapolis ... Architect." This shift in self-perception was undoubtedly brought on by his growing prominence as a designer of domestic and public buildings and furniture. Today there is little dispute that Buckland was one of colonial America's greatest architects.

LUKE BECKERDITE

Biography

Born in Oxford, England, 1734. Apprenticed as a joiner to his uncle, James Buckland, London, 1749–55. Served indentures as a cabinet-maker and house-joiner under Thomas Mason, Fairfax County, Virginia, 1755–59. Active as an architect and carver in Richmond

County, Virginia, with workshops producing furniture and architectural components, from 1761. Moved to Annapolis, Maryland, 1771. Died in Annapolis in December 1774.

Selected Works

Examples of furniture attributed to Buckland's workshop are in the collection of the Museum of Early Southern Decorative Arts, Winston-Salem, North Carolina, and in the Colonial Williamsburg Foundation, Williamsburg, Virginia. Carving attributed to Buckland's workshop survives in Gunston Hall, Virginia, the Chase-Lloyd House, Annapolis, and the Mathias Hammond House, Annapolis. Notable design book collections related to Buckland are in the Redwood Library, Newport, Rhode Island, the Winterthur Museum, Delaware, the Metropolitan Museum of Art, New York, and the High Point Furniture Library, High Point, North Carolina.

Interiors

- 1755-63 Gunston Hall, Fairfax County, Virginia (south portico, interior and some furnishings): George Mason
- 1760 Truro Parish Glebe House, Fairfax County, Virginia (£93.2.0 received for unspecified work)
- 1761-64 Mt. Airy, Richmond County, Virginia (interior and some furnishings): John Tayloe II
- 1768 Richmond County Workhouse, Virginia (building and interiors)
- 1771-73 Chase-Lloyd House, Annapolis, Maryland (some exterior woodwork and interior): Edward Lloyd IV
- 1774 Mathias Hammond House, Annapolis, Maryland (exterior and interiors)
- 1774 Prison, Caroline County, Maryland (plans and elevations)
- 1774 State House, Annapolis, Maryland (£25 received for unspecified services, possibly plans for the Senate Chamber)

Buffets, Cupboards and Sideboards

The basic need for receptacles for the purposes of storage and display has been fulfilled by the development of buffets, cupboards and dressers, and sideboards (or sideboard tables). These terms are mainly used to define pieces of furniture associated with rooms intended for eating – whether the hall, parlour or dining room. As a separate development – cupboards with fitted shelves for linen or pegs for hanging clothes are generally intended for bedrooms and became known as presses (*armoires* in France), while medieval "cubbordes of boxes" or "tills" were to develop into chests of drawers.

In the Middle Ages receptacles enclosed by doors were known in England as "aumbries" – the cupboards as such being an open structure of shelves or "bordes" on which were placed cups, both for use and for display. This corresponds to the French *buffet* – a term not apparently used in England with this meaning until the late 17th century. There are many illustrations and descriptions of these "riche cubbordes well and richly garnyshed" with silver and silver gilt objects. "Dressoirs" or dressers performed the same function, with the objects arranged in tiers according to the etiquette of the time and the status of the owner, "the largest firste, the richest in the myddis, the lightest before". By the early 16th century aumbries and cupboards had begun to combine as single pieces of furniture and the former term fell into disuse. They were often fitted into the panelling of a room, sometimes with canopies over them as can be seen in Holbein's drawing of Sir Thomas More and his family. If found in bedchambers they might have been described as "livery cupboards" after the nightly delivery of refreshments for a nobleman or his honoured guests.

When in use the shelves or tops of cupboards would be covered with a cloth from a variety of different materials, white diaper (with the ends falling down each side), damask, velvets or Turkey work. Closed aumbries for the storage of food had also appeared by the late 15th century – characterised by pierced panels with late Gothic tracery patterns, to be placed in the Solar or Great Hall.

Cupboards intended for the dining room, hall or parlour of the prosperous Elizabethan or Jacobean household developed as two-tier structures: either with an open lower section, with doors flanked by panels (often splayed) in the upper section; or with both upper and lower sections entirely enclosed. They often show the full range of Mannerist ornament – posts with bulbous "cup and cover" or figurative carving, low relief strapwork or inlaid decoration with arabesques. In France they inevitably show ornamental ideas derived from Fontainebleau. The chief purpose of these pieces was for the storage of utensils required for dining "cups and glasses to drink in, spoons, sugar box, viall and cruces for vinegar, oyle and mustard pot". The Court Cupboard which developed at the end of the 16th century was intended entirely for display: they derive from the French word *court* to distinguish them from their taller cousins. They consist of three open shelves supported by posts, sometimes with drawers in the frieze.

All three types of cupboards fell out of favour in the mid 17th century except in country areas where they frequently developed regional characteristics: in Wales the deuddarn or

Buffets from Vredeman de Vries' *Verscheyden schrynwerck*, 1630 (reprint of *Differents pourtraicts*, c.1585)

tridarn types; in northern England with distinctive variations in ornamental details. In more metropolitan circles they were replaced by marble-top side tables which were often supplied in pairs. Dining rooms in the grandest houses now contained virtually no cupboard or drawer furniture for storage; the sole purpose of these sidetables (or "sideboard tables") being to display plate in the renewed vigour of the Baroque style. New types of silver objects for the sideboard now emerged. In addition to purely ornamental pieces, the fountain and monteith were now used for rinsing glasses, the wine cooler and cistern were also used for rinsing glasses, while salvers and waiters were needed for the service of wine. In addition baskets for bread and cruet frames for condiments were now all to be found. The Hall of the Teutonic Knights in Berlin shows the style at its most extreme, while at Castle Howard in the early 18th century there were two sets of sideboard plate – one in white silver for everyday, the second in gilt for best. Lady Grisell Baillie described the essential items required for the well-appointed sideboard in the early 18th century: "Bread, Water Peper, Vinegar, ail, wines, Mustard, Shalot, Smal Beer, sugerr, Oyle, Sallad".

In more modest houses the dresser reappeared, generally consisting of a long narrow table with a deep frieze containing drawers, but sometimes with closed cupboards in the lower

section. They also acquired superstructures with further open shelves intended for storage and display of earthenware or pewter.

The architectural and decorative styles of the early 18th century dictated the forms and ornament of such pieces of furniture as well as the etiquette and traditions of the time. Often the grander sideboard tables correspond to pier or side tables placed below mirrors and between mirrors in other rooms of the house. The Palladian style inspired "the sumptuous sideboard [which to] an ingenious eye has often more the air of an altar than a table", while Chippendale provided designs for whimsical variations in Rococo, Gothick and Chinoiserie tastes. Corner cupboards, in one or two stages, or on stands, or of the hanging variety, appear in the late 17th century, sometimes built-in to the panelling of a room. If they were open they were used for the display of china; if they had doors they were frequently japanned in imitation of lacquer. Alcove cupboards, both open and closed, served the same purpose, especially on the Continent. However, the appearance of glazed "china cupboards" by the mid century sounded the death knell of this former type.

The idea of a special recess in the dining room to accommodate a side table and sometimes tiers of shelves became a common enough feature in Continental Europe from the late

17th century. In England, where they appear more rarely, they are known as buffets. It was not until the early Neo-Classical period that semi-domed niches with a fitted side table (or sometimes three) became a feature. At Kedleston Hall, Derbyshire, Robert Adam designed just such a bespoke feature, also suggesting the ideal arrangement of the Scarsdale family silver, their knife boxes, jasper cistern and new-fangled *athenienne* or perfume burner. It was but a short step from here to the development of the matching five-piece suite: the sideboard table (often with a brass rail for hanging a protective cloth and for supporting candle branches), two pedestals with vases (for a variety of useful purposes), a wine cooler beneath, and a pier glass or mirror above. Hepplewhite illustrates such an arrangement in his *Cabinet Maker and Upholsterer's Guide* (3rd edition 1794, pl. 124). For less ambitious households new shaped sideboards, with hollow fronts and lateral drawers or cupboards, appeared from c.1780 from commercial firms like Gillows. With the emergence of the Regency style such pieces, inevitably Grecian, took on a new massiveness according to the taste of the time.

The 19th century saw the proliferation of new designs and styles for sideboards of all sorts, many intended for entirely new locations in the household or public building. Some of the most spectacular pieces shown at the international exhibitions were described as sideboards – the *Wines and Spirits* Sideboard by William Burges (1862), the *Pet* Sideboard by Bruce Talbot (1872). They ceased to belong exclusively to the dining room – drawing rooms now acquired pieces with identical features, often surmounted by vast mirrors and containing open shelves and glazed cupboards intended for the display of *objets d'art* of all kinds. Often these were supplied as part of a suite of furniture in a particular style – Gothic, Anglo-Japanese, “Artistic”, New Art, or the revived 18th-century styles towards the end of the century. For the past hundred years the sideboard and cupboard have shown little development: storage and display problems have been resolved by different types of furniture.

Bugatti, Carlo 1856–1940

Italian designer of furniture and interiors

Father of Ettore, the celebrated automobile designer, and the sculptor Rembrandt, Carlo Bugatti has been somewhat overshadowed by his sons and, with much of his work in private hands, his life and work are still comparatively little known. Born in Milan in 1856, he was active in a number of different media and worked variously as a designer of furniture, interiors and silverware and as a painter. His most significant work, however, was the furniture and interiors that he designed in the late 19th and early 20th centuries which combined exotic materials and rich decoration in a highly original and eccentric way. He participated in several of the major international exhibitions of this period and his emphasis upon craftsmanship was very much in keeping with the concerns of other 19th-century artists and designers. Yet, described as an “isolated genius”, he was fiercely jealous of his independence; he did not ally himself with any particular group or movement and the radical individuality of his designs defies classification.

He was the son of the sculptor Giovanni Luigi Bugatti, whose diverse interests also included architecture and science, and it is not perhaps surprising that Carlo's career should have embraced several design disciplines. He studied art at the Brera Academy of Art in Milan, although in later years he tried to give the impression that he had received no formal training. An early interest in architecture gave way to a concentration upon furniture and interiors, and he then moved on to jewellery, sculpture and even musical instruments in the latter part of his career.

He viewed the design and making of furniture as a form of pure art and took pains to master the techniques appropriate to different materials. This facilitated a close understanding of the individual properties of each medium and allowed him to manipulate and exploit materials in a unique and highly personal way. The development of his furniture can be divided into three phases: in the first his work has been described as “quaint and whimsical”; in the second he became bolder, relying on the circle, or parts of the circle, as the foundation for the design; and in the third phase his work became increasingly fluid and sculptural in form.

Bugatti's earliest known furniture is the bedroom suite he designed and made as a wedding present for his sister in 1880. This suite consisted of a pair of chairs, a bed-head and foot-board, and bedside cabinets. The pieces are constructed out of heavy, dark timber, and their geometric forms are alleviated only by asymmetrical features and the elaboration of the decoration. Applied wrought copper and fine fenestrations, combined with friezes of inlaid wood and ivory reflect the influence of contemporary fashions, and the impact of exotic Middle Eastern and Japanese styles, which were extremely popular during this period, are clearly evident in this work.

It was also during this phase of his career that Bugatti exhibited at the Italian Exhibition at Earl's Court, London (1888), where he was awarded a Diploma of Honour in recognition of the originality of his designs. In the same year he established his own workshops in Milan for the commercial production of his furniture. In 1900 he was commissioned to provide furniture for the Khedive's Palace, Istanbul, a project

that underlined his skill in adapting the Moorish style for contemporary European furniture. In 1901 Bugatti executed his first complete interior, The Flowers Room, for the first Lord Battersea in London. Every detail of the room was subjected to Bugatti's discerning eye and the result was a sumptuous theatrical statement of pure opulence.

During the 1890s the second distinct phase of Bugatti's work had begun to emerge. The solid timber structure remained along with increasing use of materials such as vellum set against intricate inlaid metal borders and ornament inlaid in ivory and mother-of-pearl. But his style developed away from picturesque asymmetry towards more balanced geometric shapes and there was much greater emphasis upon the circle as the dominant form. A typical example is the desk in the Metropolitan Museum, New York.

The Decorative Arts Exhibition in Turin (1902) marked the beginning of Bugatti's third, "organic" phase. He exhibited furniture within complete room-sets that illustrated the type of decoration and accessories that would be appropriate for his work. Placed against a backdrop of panelled walls and richly patterned carpets, Bugatti's furniture was almost completely covered in vellum, and the vellum itself was also decorated. The most extravagant of his room-sets was the Camera del Bovolo or Snail Room which included a table and chairs and high-backed banquette seats whose forms were based on the snail-shell spirals. The furniture was extremely sculptural and combined sweeping curves with geometric decoration. Its extraordinarily eccentric style anticipates some of the African-inspired furnishings produced some twenty years later by Art Deco designers such as Pierre Legrain and Armand-Albert Rateau. In recognition of his originality, Bugatti received another Diploma of Honour for this work.

In 1904 Bugatti moved to Paris. His furniture business was sold to the Milanese firm of De Vecchi who continued to produce his work. Bugatti himself became more involved in producing designs for silverware, and an exhibition of his work in 1907 illustrates his unique ability to mix different materials harmoniously, displaying pieces with delicate combinations of silver, ivory and turquoise. He continued to exhibit designs at the Salon des Artistes Décorateurs in 1910 and 1911 but in 1913 his wife's ill-health forced him to leave Paris and he concentrated increasingly on painting. Lacking any pupils or direct imitators, he was nevertheless the only Italian designer of the late 19th and early 20th century to gain international recognition and acclaim, and his work stands out as virtually unique for its time.

RACHEL E. FRENCH

Biography

Born in Milan, 12 February 1856, the son of the sculptor Giovanni Luigi Bugatti. Studied architecture at the Accademia di Belle Arti de Brera, Milan, late 1870s. Married Thérèse Lovioli in 1880 (died 1935): 1 daughter, and 2 sons, the automobile designer Ettore and the sculptor Rembrandt. Designed his earliest known furniture, 1880; established a commercial workshop for the production of furniture in Milan, 1888. Exhibited at several national and international exhibitions; awarded Diploma of Honour, Italian Exhibition, London, 1888, and Turin, 1902; silver medal, Exposition Universelle, Paris, 1900. Sold furniture-making business to De Vecchi and moved to Paris c.1904; took up painting. Exhibited silverware at the Galerie Hébrard, Paris, 1907, and at the Salon des Artistes-Décorateurs,

1910 and 1911. Moved to Pierrefonds c.1910; moved to Molsheim c.1937. Died near Molsheim in April 1940.

Selected Works

Much of Bugatti's work is in private collections but examples of his furniture can be seen in the Museum and Art Gallery, Brighton, Sussex, the Musée des Arts Décoratifs, Paris, and the Metropolitan Museum of Art, New York. A chair from the Camera del Bovolo is in the Brooklyn Museum, New York.

Interiors

- c.1901 Bedroom for Cyril Flowers, 1st Lord Battersea
- 1902 International Exhibition of Decorative Art, Turin (four rooms, including the Camera del Bovolo or Snail Room)

Built-in Furniture

Furniture that is made as an integral part of the fabric of a building, or built-in as an addition, has a very long history. It has been an essential part of the Japanese interior for many centuries, and has been part of the Western furnishing environment since the earliest homes.

Among some of the earliest surviving furniture are the built-in bednooks, cupboards and "dresser" located in the Neolithic settlement of Skara Brae in the Orkneys. Constructed from stone at the same time as the house, this built-in furniture was an integral part of the interior as well as the fabric of the building. This tradition continued into medieval churches, where stone seats and benches were commonly built into walls of chapter houses and choirs. In medieval domestic dwellings, the use of fixed wooden benches was common in a range of houses up to the 17th century. In addition to benches, cupboards and beds were among other furniture that was built-in. The space-saving reasons are clear, but questions of hygiene in the case of food, and personal comfort and privacy in the case of beds, gave a range of reasons in addition to the cost savings that

might be achieved by building in furniture during the construction of a house.

Changes in the use of built-in furniture occurred as the well-to-do became less peripatetic and demanded more versatile moveable furniture for their interiors, as opposed to the built-in items that were located in the less genteel sorts of dwellings. What this meant was that built-in furniture generally remained a less important form of furnishing in high-style interiors, yet continued to be highly important to the vernacular buildings. Indeed, built-in furniture was the rule in most commonplace buildings up to the 19th century.

The forms of built-in furniture often varied with the locality. In Devon, for example, farmhouses often had a kitchen with a fixed wooden bench under a window wall to be used in conjunction with a long table. A deep recess next to the fireplace had a large built-in cupboard which was used for storage and display, while a built-in corner cupboard was also on the other side of the hearth for storage. In the north of England, it was common to screen off the inglenook by a wooded seat called a heck or speer, built into a wall divider. The spice cupboards of the Lake District are an early indication of a pragmatic solution to a problem by using built-in storage. By building a cupboard in the wall where a fire was made, and fitting it with a tight door, the cupboard interior could be kept dry for salt, spices, etc., and yet remain convenient for cooking. These wall cupboards are also found in other parts of northern England from a later date.

The best known examples of historic built-in furniture are beds. Various arrangements of built-in beds have existed for many centuries, but it was in Scotland that the built-in wall or cupboard bed tradition was most strong. The box beds were clearly intended to provide privacy and a degree of warmth in a one- or two-room house. This Scottish custom remained in both the remote highland and island areas as well as in the lowland areas (for example in Robert Owen's New Lanark as well as urban tenement blocks) well into the 20th century.

In some cases wall and furniture were combined in that the built-in furniture in one room served as a wall on the other side. Sometimes these pieces were used in conjunction with an added partition wall. Long lateral settles, or large press beds were used in these cases, being common in North Wales and Ireland until the beginning of the 20th century. Another way of saving space and money, was by building in a cabinet across a corner. J.C. Loudon's *Encyclopaedia* (1833) described such an item: "the shelves, which are supposed to be of deal, are let into the plaster; and the whole, outside, and inside, including the plaster between the shelves is painted of a wainscot colour. The cost will be considerably diminished by having the upper doors in single wooden panels."

Other built-in furniture of various kinds has also been part of the interior furnishings of vernacular houses. Hinged wall-mounted tables, larders, closets, alcove cupboards and a wide variety of specialist storage cabinets, often related to particular geographical areas are among the diverse range of built-in furniture.

However, not all built-in furniture was associated with the vernacular or common home. In the late 17th century, Cornelius Meyer (1629-1701) published designs for an amazing arrangement of built-in and folding fixtures and fittings to furnish his famous one-room fantasy. During the

later 17th and 18th centuries, certain forms of high-style built-in furniture were in vogue. Room arrangements by such designers as Jean Berain and J.-F. Blondel often included luxurious beds built into niches, built-in buffets fitted into wall panelling, and sofas designed to fit into particular parts of the schemes in conjunction with the panelled wall designs. On a less grand scale, the built-in alcove was a feature of the first half of the 18th century. These display niches were often surmounted with a decorated semi-hemispherical head with pilasters framing the recess. These recesses became less popular with the decline of panelled walls, but have experienced a revival in some later 20th century interiors.

The development of libraries in the 17th century, and their wide acceptance in the 18th century, promoted a demand for book storage for which the built-in bookcase provided the ideal answer. In many instances they were contrived as part of the architectural shell of the room and were treated as such by the architect. The library at Ham House, Richmond (1670s) has built-in book storage as well as an integral writing cabinet. The library at the Hôtel de Lauzun, Paris, was devised so that books were stored in cupboards, whose doors were part of the integrated panelling scheme. Adam's magnificent Neo-Classical library at Osterley Park is an example of the grand architectural treatment that was popular in the 18th century.

During the 19th century, the American Shaker sects espoused the idea of built-in furniture. They produced elegant and functional built-in cupboards, chests and storage pieces designed to avoid clutter and display and to satisfy their creed of cleanliness and tidiness.

By the later 19th century the traditional built-in inglenooks of cottage homes were adapted to the Arts and Crafts-influenced middle-class tastes of the time. In addition to this revival there was a taste for built-in window seats and the so-called "cosy corner". The latter, which may have derived from medieval originals, were designed to be free-standing or built-in as an integral part of the wall. Cosy-corners often emphasised elaborate upholstery and carved features to promote an air of luxury and exoticism.

In contrast to the frivolous nature of the Victorian cosy-corner, at the turn of the 20th century, built-in furniture was seriously considered for its practical advantages. The taste for built-in wardrobes in the early 20th century was noted by the German architect, Hermann Muthesius. In his *The English House* he recorded that "built-in cupboards form a major element in the treatment of walls and are the most characteristic feature of the modern English bedroom". Although Muthesius warned against excessive built-in mania, he generally agreed with R.W. Edis, who, twenty years before, had recommended built-in cupboards in his *Healthy Furniture and Decoration*, as being hygienic. Muthesius added that they were also artistically advantageous "as they kept the room free and empty, so creating an impression of space and size". However, even such an apostle as Muthesius railed against the taste for built-in wash-stands which he considered were most unsuitable for their purpose.

During the 20th century, built-in furniture has developed from a vernacular necessity and a response to Victorian concerns with hygiene, to become a ubiquitous part of interior design and furnishings. The combination of apparent cleanliness, simple function, space-saving, and the integrated nature

of built-in furniture meant that it satisfied most requirements on one level or another. The idea of built-in furniture was soon sold to the new generations of home-makers. Again the reasons were more often practical than aesthetic. Christine Frederick, in her *Household Engineering*, had designed a house that could be maintained solely by a housewife. No doubt influenced by developments in office and factory planning and layout, she achieved this improvement by reducing the size of rooms, and also in the extensive use of built-in furniture. Her main reason for using this form of furniture was that it never needed moving and it made cleaning simpler.

In contrast to the purely practical aspects of built-in furniture was the growing desire on the part of some architects for a modern integrated building incorporating shell, interior, and furnishings. Frank Lloyd Wright in his "In the Cause of Architecture" (*Architectural Record*, March 1908) pointed out the role of built-in furniture in this integration process: "The most truly satisfactory apartments are those in which most or all of the furniture is built in as a part of the original scheme". When this concept was combined with ideas of cleanliness, function, practicality, space-saving and convenience, it is easy to see how built-in furniture was espoused by the new generation of Modernist architects. For example, Le Corbusier in his Villa Savoye, Pierre Chareau and the Maison de Verre, and Rietveld's Schröder House demonstrate the remarkable cohesion that built-in furniture and fittings can give to an architectural concept. The concept of built-in went hand in hand with ideas of function and rationality, so it is no surprise to find that fitted furnishings were soon part of the repertoire of most advanced architects. From these radical examples, along with the ideas of scientific management, built-in furniture was to become one of the hallmarks of most Modernist interiors.

By the second half of the 20th century some of the pre-war Functionalist architects' ideas were used in a diluted form in general practice. Built-in furniture was to gain wide acceptance both in new building (especially flats) and in re-planned private interiors. In this period, flat dwellers were seen as particularly lucky in that built-in furniture was usually supplied as a matter of course.

In 1947 *Modern Homes Illustrated* praised built-in furniture as being labour-saving and space-saving, and for "living" it was seen as especially suitable for small homes. Traditional ideas were revived and recommended. A built-in sideboard between the kitchen and dining room, with a hatch and two-way drawers was seen as a valuable feature. Another reclaimed idea was to have cupboards built-in as a double wall between two bedrooms, so that one half served one room and the other half served the other room. This was successfully incorporated into English prefabricated housing after World War II.

In the second half of the 20th century, "built-in" furniture has become the norm for many parts of an interior. The availability of pre-prepared and packaged panels and parts all made to standard modules, in combination with the expansion of the DIY trade, has led to the irresistible rise of the fitted kitchen and bedroom. In addition, the boom in the DIY sector has encouraged home-makers to build in their own fixtures, whether shelves in alcoves or fully fitted kitchens. In Europe it is common for a residence to have very little free-standing furniture (except for chairs), the rest of the storage requirement being built-in. A more recent trend has been the fitting of

customised furniture, designed for individual rooms and built-in by a joiner.

Bulfinch, Charles 1763-1844

American architect

No practitioner in design better represents America's Federal period than Boston's Charles Bulfinch. Born in the decisive year of 1763, when the Colonial period began its road to Revolution, he died in 1844, during a powerful era of expansion in the USA. Scion of an old Boston family, Bulfinch graduated from Harvard in 1781, just before the close of the Revolution, and entered young manhood in a time of great prosperity for Boston.

Interested in architecture, and somewhat familiar with its principles through a small but select library of architecture books owned by his grandfather, Bulfinch visited England, France, and Italy between 1785 and 1787. In England he became enthralled with the conservative Neo-Classicism then in the twilight of its popularity. He saw the work of William Chambers and the interior decorations of James Wyatt both at Heveningham Hall and at the Pantheon in London. In Paris he met Thomas Jefferson and the Marquis de Lafayette, who provided letters of introduction that admitted him to notable hôtels and châteaux. For several months he remained on the road in Italy, studying the classical ruins he had known heretofore in books in the Harvard library.

Back home in Boston he entered the field of design rather as a gentleman, enjoying, as he put it, a "season of leisure, pursuing no business, but giving gratuitous advice in Architecture." Among those he designed houses for was Joseph Barrell, a wealthy merchant and shipper. This villa summed up early the particular "style" with which Bulfinch was to captivate New England for an entire generation. Built of pinkish red-brick, with pine trim painted cold white, the Barrell house was in plan a rectangle, pierced by a semi-circular projection that rose from the ground, on above the second storey cornice line, and

inside provided a saloon of that shape, rising a storey and a half and lighted by double bands of windows.

The plan is reminiscent of French houses of the time, with a succession of spaces climaxing in the saloon. As a surprise, a transverse hall featured a large “flying” staircase of wood, sweeping up in two ranges that united on a landing, then parted again to reach the second floor. Delicate composition ornaments appeared as Neo-Classical figures, urns, and swags and adorned the principal interiors as borders and also as ornament on door surrounds. The mantelpieces were marble. In the saloon a curved recess contained a stuffed satin *banquette*, with cushions laid against the wall. The pine floors were carpeted wall to wall. A bowed porch opened through the saloon’s windows, giving a view over formal gardens and the river to Boston.

Barrell’s house, the most ambitious of the early dwellings by Bulfinch, was considered the finest house in New England. Hardly had its paint dried when commissions came from the Secretary of War, Henry Knox, and also the fashionable beauty Mrs. Perez Morton. The latter’s house was built of frame, somewhat resembling a traditional New England house, with embellishments. The interior, however, was very grand. Composition decorations were richly Adamesque with sunrays, pearl-beads, and garlands. The drawing room’s coved ceiling was decorated with a deep swag of flowers.

Apparently Bulfinch accepted no fees for his work at this time. Possessed of family wealth, and living at home, he was a gentlemanly adviser, but one eagerly absorbing lessons in building from the tradesmen. From the first he had a strong affection for fine workmanship. His knowledge of construction grew, as his fascination with building increased. In 1796, at the zenith of Boston’s post-Revolutionary boom, he persuaded his family to invest in a remarkable real estate development known as the Tontine Crescent, which he built a few blocks from the center of Boston. Tall and elegant, the Tontine houses were worthy of the Bath crescents that inspired them. Alas, in a temporary business slump, the Tontine Crescent threw Bulfinch and his kin into financial ruin.

All he had left was his architecture. He learned to charge fees, and though never a businessman, he struggled to make his projects support his family. Between 1796 and 1798 he completed his greatest public building, the Massachusetts State House, a direct although liberal borrowing from Chambers’s Somerset House, which he had admired on his trip to England.

While the main influences on the structure are unquestionably English, Bulfinch also borrowed from A.-J. Gabriel’s façades on the Place de la Concorde in Paris, and somewhat from the national capitol of the time, New York’s Federal Hall, by Pierre Charles L’Enfant. The latter seems to have inspired a princely touch in interior decoration, which was rare in Bulfinch. The General Court, which stands behind a long colonnaded porch, has colonnaded galleries and rich arcades fashioned into ashlar reminiscent of stonework; it is domed and embellished with elaborate Neo-Classical composition ornament set against smooth plaster walls. *Guilloche*, garlands, modillions, rosettes, Ionic-capped pilasters, immense bursts of leaves and flowers all characterize both General Court and Senate. Wood trim by comparison is somewhat plain, although finely moulded. Presumably the surfaces have always been white, as they usually are today, although it would

not be hard to imagine the flat walls tinted, to emphasize the splendors of the composition ornament.

Row houses, churches, mansions, country residences, a prison, and remodelings of colonial buildings were projects he completed with distinction. His plans were often innovative, largely English, with French touches. The design themes of the interiors were nearly always the same, employing flat plaster, with composition embellishments. For the New South Church in Boston he devised a dome in plaster on lath, with deep span-drels; lesser groin vaults gave to the side aisles and altar area drama in light and shadow. At the Church of the Holy Cross, the ceiling is a shallow barrel vault crossed by smaller barrel vaults springing from Corinthian pilasters and lighted by arched windows.

Ironically, the best representative of his interiors is a painting which is one of the most valuable documents of America’s Federal era, Henry Sargent’s *The Dinner Party* (Museum of Fine Arts, Boston). It shows an interior – a ground floor dining room – in the Tontine Crescent. Spare in ornament, the room has a plaster cornice in white, against butter-yellow walls, with mahogany-grained doors and white mantel and door trimming. The floor is covered wall to wall with an ingrain carpet; red silk is swagged over the two windows, unlined, with light passing through it where a shutter is open. Gilt-framed pictures hang high on the wall, lined up like soldiers. Gentlemen sit at a long mahogany table, beneath the light of an Argand chandelier that awaits movement up or down by way of a counter-weight device in its chain.

Making a living was hard on Bulfinch. At one point he went to prison for his debts. He accepted a salaried public office in 1799, in which he served for many years, designing and building privately all the while. In 1817, when President James Monroe visited Boston on his New England tour, Bulfinch was his guide. So delighted was the president with Bulfinch’s work that he offered him the position of architect of the US Capitol, which was then under construction.

With a substantial salary, Bulfinch moved to Washington, DC, where he worked for the government until 1830. He proved as adept with monumental architecture as with the domestic mode that had made him famous. Bulfinch built the Capitol’s central rotunda on the east side and the Library of Congress on the west; the building externally is in harmony with the French Neo-Classicism of the wings, already underway, and was originally crowned with a tall, bulbous dome that, while it appears characteristic of Bulfinch, was not his preference but that of the building committee.

His rotunda, with its echoes of the Pantheon in Rome, survives today complete. It is at once a very simple and an august interior, carried out in marble, with a majesty of form, light, and shadow that makes it one of the greatest of all American public interiors. The excellence of Bulfinch’s taste in design, detail, and quality of workmanship are evident everywhere. Note for example the lobbies to the rotunda, with their chaste Corinthian columns in pale gray marble; their delicacy of design and skill in execution is worthy of fine statuary. Light pours into the space through a high-placed ring of windows and spills onto pilasters, classical panels, and patterned marble floors.

The Library of Congress chambers, which no longer exist, were workrooms surrounding a central reading room two

storeys high, with Corinthian pilasters and columns along the walls. The shallow, sky-lit ceiling was decorated with composition work in Neo-Classical motifs. For this interior Bulfinch designed a Neo-Classical stove in iron, a column topped by an urn.

Bulfinch is best-remembered for his houses and for the Massachusetts State House. However, it was after his move to Washington that he really proved himself an architect. Already in his fifties, he made a distinguished place for himself comparable to that of any architect in the nation. Today's west front of the Capitol, with its porch that once opened off the reading room of the Library of Congress, is known as the Bulfinch Front.

WILLIAM SEALE

Biography

Born in Boston, Massachusetts, 8 August 1763. Educated at Harvard University, 1778–81 (M.A. 1784). Toured Europe, visiting England, France and Italy, 1785–87; met Thomas Jefferson and the Marquis de Lafayette in Paris. Married his cousin, Hannah Apthorp, 1788 (died 1841); 7 children. Worked as an accountant for a local Boston merchant, 1787. Practised as an architectural adviser on an amateur basis, Boston, from the late 1780s. Following the failure of the Tontine Crescent development, suffered financial ruin and practised as a professional architect, Boston, from 1796. Accepted salaried post as Chair of Boston's Selectmen and Superintendent of Police, 1799; appointed supervising architect for the United States Capitol Building, Washington, DC, 1817; lived in Washington, DC, 1817–30. Retired to Boston, 1830. Died 4 April 1844.

Selected Works

Important collections of Bulfinch's drawings and designs are in the Library of Congress, Washington, DC. Numerous archive photographs of Bulfinch's buildings, including views of interiors, are in the Connecticut Historical Society, Hartford, and manuscript material relating to his work on the Harrison Gray Otis House and the Derby House is in the Essex Institute, Salem, Massachusetts.

Interiors

- 1792–93 Joseph Barrell House, Somerville, Massachusetts (building and interiors)
- 1793 Charles Bulfinch House, Boston (building and interiors)
- 1793–94 Theater, Boston (building and interiors)
- 1793–96 Tontine Crescent, Boston (buildings and interiors)
- 1793–96 State House, Hartford, Connecticut (building and interiors)
- 1795–96 Harrison Gray Otis House I, Boston (building and interiors)
- 1795–97 State House, Boston (building and interiors including the Representatives Room, Senate Chamber and Council Chamber)
- 1795–99 Elias Hasket Derby House, Salem, Massachusetts (building and interiors)
- c.1796 James Swan House, Dorchester, Massachusetts (building and interiors)
- 1796 Perez Morton House, Roxbury, Massachusetts (building and interiors)
- 1800–02 Harrison Gray Otis House II, Boston (building and interiors)
- 1803–04 Thomas Amory House, Boston (building and interiors)
- 1805–08 Harrison Gray Otis House III, Boston (building and interiors)
- 1811 Essex Bank (now Salem Fraternity Building), Salem, Massachusetts (building and interiors)
- 1818–29 US Capitol, Washington, DC (rebuilding and completion of work by Benjamin Henry Latrobe, and interiors)

1829–32 State House, Augusta, Maine (building and interiors)

Bullock, George 1782/83–1818

British sculptor and cabinet-maker

George Bullock is celebrated as one of the most innovative cabinet-makers active during the Regency period. It was his individualistic ability as a designer which distinguished the furniture made in his workshops from that of his contemporaries.

Details about Bullock's early life remain vague, but he appears to have been born in Birmingham where he followed in his mother's footsteps as a wax modeller. His earliest known work is a wax relief of the great collector Henry Blundell executed in 1801, by which date it is assumed that Bullock had arrived in Liverpool. By 1804 he had begun to practise there as a cabinet-maker as well as a sculptor and had various work-

Bullock: drawing room window curtain from Ackermann's *The Repository of Arts*, April 1817

shops in the city until 1814, when he became fully established in London. Bullock's reputation rests principally on this final phase of his career (1814–18) during which time he created some of his most characteristic furniture and when he executed his major commissions.

Bullock never entirely discarded sculpture and continued to make busts even while presiding over his grand establishment and newly built workshops in Tenterden Street, London. As well as furniture, Bullock designed interiors, textiles, light fittings, silverware, ceramics and chimneypieces. These last were made of the so-called Mona marble (mainly green like *verde antico* and red) from the quarries he owned on Anglesey. Although Bullock did not publish a self-promoting pattern book, he was, from the start, a skilful publicist and made good use of the Liverpool press to announce new developments in his career. Later, from 1816–17, he contributed eight attributed and five anonymous designs to the monthly series on "Fashionable Furniture" which appeared in Ackermann's *Repository of Arts*. This would have been an excellent publication in which to introduce to a wider audience his furniture, chimneypieces and interiors.

Bullock is first noted as a cabinet-maker in partnership with William Stoakes; together in 1804 they advertised as "General Furnishers and Marble Workers". In December that year Bullock designed a Gothic drawing room for the Marquess of Cholmondeley, for whom he also supplied furniture and mock

armour. In the *Liverpool Chronicle* (4 September 1805) Bullock took the "opportunity of acquainting his Friends, and more particularly those ... who have expressed a desire to see the Rich Gothic Furniture, Armour &c WHICH HE HAS DESIGNED AND EXECUTED FOR LORD CHOLMONDELEY ... previously to their being removed to Cholmondeley Castle". Throughout his career, Bullock moved easily between the Gothic, Old English (Antiquarian) and Neo-Classical styles. A rosewood and brass inlaid table (National Museums and Galleries on Merseyside), acquired by Sir William Cumming in the 1819 sale following the closure of Bullock's workshop, is a Neo-Classical variant of an oak Gothic-revival table designed for Battle Abbey, c.1817 (now in the Victoria and Albert Museum, London).

Although Bullock does not appear to have received any formal artistic training, he benefited from being taken up by such discerning figures as the Liverpool poet, patron and art historian William Roscoe and Henry Blundell, also of Liverpool. It was perhaps from Blundell's substantial collection of antique sculpture that Bullock learned the Classical vocabulary he adapted so naturally in his London-period furniture. For example, Blundell owned a restored relief *Girl Before a Round Temple* (National Museums and Galleries on Merseyside) a detail of which Bullock drew and turned directly into the pattern for a marquetry panel. Other immediately identifiable influences on Bullock's artistic development were

Thomas Hope's *Household Furniture* (1807) and the published designs of Piranesi and Percier. However, on every occasion where these debts can be established, it is also the case that Bullock has effected a distinctly personal transformation.

The most important source for our understanding of Bullock as a designer is an album of tracings known as the Wilkinson Tracings (City Museum and Art Gallery, Birmingham). On more than 200 sheets, there are hundreds of designs for furniture, silver, monuments, metalware, mounts, "buhl" marquetry, chimneypieces and interiors. The cover states these are "from designs of the late Mr George Bullock 1820". These, or another version, remained in his workshop after his death. The Wilkinson Tracings offer a broad overview of Bullock's mature achievements in the full range of styles which he employed. They also record the names of several clients, including those such as Mr. Sone (sic), Mrs. Barron, Lady Spencer, Sir Henry Bunbury and Lady Ormond for whom no other evidence of patronage survives.

A good idea of the appearance of a Bullock interior can be gained from the Drawing Room Window Curtain in Ackermann's *Repository*. The design shows elaborate curtains either side of a bold "dwarf cabinet" with brass grilles and marble slab, on top of which sits a bronze colza lamp. In common with major designers from the previous century such as William Kent and Robert Adam, Bullock clearly saw the importance of being involved with every aspect of the interiors he created.

Bullock's London career was brief but successful. The Prince Regent had already been patron of the Liverpool Academy, where Bullock had been the first president. In 1814, Queen Charlotte gave a cabinet by Bullock to Princess Sophia of Gloucester and there is other evidence of Royal patronage. On many of his better known commissions Bullock worked alongside the architect William Atkinson, including at Abbotsford, Biel, Gorhambury and Scone. His work at Abbotsford connected Bullock with Walter Scott's literary circle and strengthened his involvement with the nascent Antiquarian movement, to which the writer was such a central figure. It is, however, another Atkinson / Bullock commission that perhaps crowned his career.

In 1815 Bullock was chosen by the Prince Regent to supply the furniture and all the other domestic requirements for Napoleon and his entourage who were to be exiled on St Helena. As architect at the Board of Ordnance, Atkinson was responsible for the house. This well-documented commission saw Bullock designing a suite of interiors, all fully furnished and lavishly upholstered in fashionable Regency period taste. Bullock supplied a wide range of furniture, some in the British oak of which he was a keen advocate, but much in mahogany inlaid with ebony (which he also favoured) and also some ebonised and brass inlaid pieces.

Several features combine to distinguish Bullock's furniture. In design many of his cabinets, tables and chairs have a boldness dictated by an artist's creative eye rather than by more purely practical considerations. His choice and combination of materials created a powerful and striking effect: for example, in the contrasting use of oak and ebony on his clearly delineated marquetry, the designs for which were often inspired by British plant forms. In general, his treatment of flat pattern can

be seen as anticipating the approach, later in the century, of designers such as A.W.N. Pugin and Owen Jones.

A year after Bullock's death, having lost the driving inspiration of his forceful personality, his workshop was sold up. Much of the stock-in-trade (including marquetry panels, partly made up furniture, patterns for metalwork and design drawings) was acquired by the London cabinet-making trade. Thus, features of his style were immediately circulated and began to be incorporated into the production of Bullock's talented, but less inspired contemporaries. His distinctive furniture design was also disseminated by admirers such as Richard Brown (*Rudiments of Drawing Cabinet and Upholstery Furniture*, second improved edition, 1822) and Richard Bridgens (*Furniture with Candelabra*, 1826).

Bullock's work and personality were much admired by his friends. As Richard Brown wrote: "The late Mr Bullock was the only person who ventured into a new path ..." (*Rudiments* ..., under pl. XXV). And Sir Walter Scott observed: "he had a taste rarely found in that profession in which such sums of money are expended to make more barbarous and costly monstrosities ..." (Wainwright, 1988).

MARTIN P. LEVY

Biography

Born in Birmingham, 1782/83. In Liverpool by 1801; working as a sculptor, modeller and cabinet-maker by 1804; trading as Bullock and Stoakes with William Stoakes from c.1805 (partnership dissolved 1807); involved with the mining of Mona Marble in Anglesey from c.1806; in partnership with J. M. Gandy as "architects, modellers, sculptors, marble masons, cabinet-makers and upholsterers" from 1809; established in London as a sculptor, furniture maker, and proprietor of the Mona Marble Works from 1814. Continued to practise as a sculptor and exhibited at the Liverpool Academy and the Royal Academy, London. Contributed designs to Ackermann's *Repository of Arts* 1816–17. Died 1 May 1818; workshop closed 1819.

Selected Works

Examples of Bullock's furniture are owned by the Walker Art Gallery and Sudely Art Gallery (National Museums and Galleries on Merseyside) Liverpool, and by the Victoria and Albert Museum, London. An important album, containing more than 200 sheets of designs for furniture, silver, monuments, chimneypieces and interiors, known as the Wilkinson Tracings, is in the City Museum and Art Gallery, Birmingham.

Interiors

- 1805 Cholmondeley Castle, Cheshire (furniture and armour for the Gothic drawing room): Marquess of Cholmondeley
- 1814–19 Blair Castle, Perthshire (furniture): Duke of Atholl
- 1815 Longwood, St. Helena (furniture and fittings for Napoleon's use)
- 1816 Tew Park, Oxfordshire (furniture and fittings): Matthew Robinson Bouton
- 1816–19 Abbotsford, Roxburghshire (furniture and fittings): Sir Walter Scott
- 1816–17 Battle Abbey, Sussex (furniture and fittings): Sir Godfrey Webster

Buontalenti, Bernardo 1531–1608

Italian architect, designer and engineer

The chief architect of the Florentine Medici family in the second half of the 16th century, Bernardo Buontalenti worked in various media and his activities covered every area of courtly life. Trained as a painter and architect in the circle of Salviati, Bronzino and Vasari, he also worked as an engineer and he is even reputed to have designed a perpetual motion machine. His interest in scientific and mechanical studies was shared by his patron, Grand Duke Cosimo, and his work for the Medici frequently involved jobs where such expertise was essential. Buontalenti’s understanding of waterworks was the key to his fantastic designs for the Boboli Gardens Grotta Grande, and the layout of the grounds at Pratolino, and his elegant and eccentric designs for these projects were no less influential than his designs for masques and silver and hardstone vessels. He worked in a refined but energetic proto-Mannerist style and his work was both flamboyant and grand. Surviving examples and drawings illustrate his wit and artistic independence, qualities that were all the more unusual at a time when grace was a codified virtue and the undisputed authorities were classical forms.

Buontalenti’s earliest work for the Medici household was as a planner of festivals at the wedding of Francesco I and Johanna of Austria in 1565; the Medici nuptial masque consisted of a fully realised naval battle. He was also involved in the renovation of the Casa di Bianca Capello which he decorated with a delightful festooned, scrolled and figured sgraffito fresco on the street façade in 1567. Such pleasing accomplishments were rewarded by Francesco I with a commission to

design a villa and its grounds, the Pratolino. Sadly the main building of the villa was destroyed in 1822, but plans and a lunette painting by Giusto Utens of 1599 as well as visitors’ descriptions survive. The French essayist Montaigne was deeply impressed on his arrival in 1581 and commented favourably on the time and care that had gone into creating such a complex. A lake and waterfalls were engineered so that even during the summer water levels were constant. Much of the ornamentation of the extremely elaborate waterworks was mechanised and the grottoes were installed with moveable scenery. The gardens also contained organs, topiary, an aviary, a maze and numerous examples of statuary and fountains. On one of the lawns there were hidden sprinklers from which an automated shepherdess would gather water in a bucket while a small satyr played his pipes. The grounds were designed to be an entertainment and the landscape was fashioned accordingly. The villa rose above symmetrically laid-out gardens. The chapel is still standing; it is a small, graceful domed structure that Buontalenti would repeat with modifications later in his Tribuna in the Uffizi. Pratolino is an excellent example of the harnessing of intricate fancy to complex mechanics for which Buontalenti was so celebrated.

The Uffizi was Vasari’s last Medici project and he did not live to see its grandeur realized. His students Buontalenti and Alfonso Parigi inherited the job and carried it through to completion. Among the many buildings incorporated within the Uffizi was Buontalenti’s octagonal domed Tribuna (1574–89). The design included clerestory windows, which the earlier Cappella at Pratolino had not. And the interior was ornamented from floor to the ceiling. The marble floor was patterned to divide the space into a graceful ground plan articulating each block of the interior space corresponding to its segment of the unifying dome. The revetment on the floor was imitated up the walls and around the window niches in paint, wooden and plaster mouldings and *pietre dure*. The dome itself was painted brilliant blue with gold-leaf, starry scales. The connection and contrast between the solid geometry of the floor and the dizzy illusionism of the roof lent a sense of gravity and airiness to a small and powerful room. Buontalenti’s controlled seriousness may have been informed by his interest in fortifications for which he also drew plans. Such sombre effect was perhaps not his favoured design product, but it was evidently a part of his more rigorous Renaissance formalist vocabulary – a part he would express again in his designs for the Cappella de’ Medici, San Lorenzo.

Another triumph of decorative extravagance and technical virtuosity is the Boboli Gardens complex (1583–93). Buontalenti took over the general plans from Tribolo and worked in conjunction with Bartolommeo Ammanati who was architect of the extension project of the Pitti Palace. Vasari had also been involved in the planning stages but his designs for the façade of the grotto do not survive and were never completed. The grotto, known as the Grotto Grande, is arguably Buontalenti’s masterpiece. Flat lintels over columns make up the niched lower elevation which was crafted into a loggia with three arches while, in the interior, the free handling of forms explore the Renaissance concept of the grotesque. Exaggerated or stylized natural elements are carefully aggregated in unnatural volumes and combinations. According to the historian Eugenio Battisti, “The symbolic and pictographic language of

the grotesque voices such marvellous ideas! But unfortunately it follows no glossary, no syntax, no conventional, united plan. Sometimes it has a relationship with the material whose soul it attempts to reveal; it articulates itself in the vaguest ways as the material suggests; it does not speak aloud by hints without explaining. And at least in certain of its forms, for example crystal, it expresses itself in a wide variety of formal tendencies which always demand new images and alternative technical solutions for displaying them."

Although Buontalenti's grotto does follow a united plan, the intention was to surprise and dissemble at every opportunity. The basic materials are plaster, stone, sponge, pumice and shell. Their textures ripple and blend into one another, agitating the heavier outlines of the forms they describe. The shapes are therefore a kind of three-dimensional *trompe-l'oeil*, and the rocks, waves, and stalactites prove on closer inspection to be a community of human and animal figures. The challenge of interpreting the forms and their relationship to the supporting walls, surrounding spaces and materials was further complicated when the grotto was first constructed due to Buontalenti's masterful manipulation of light. There are no windows and the only source of light is the oculus in the ceiling. The plans originally adapted this space for a crystal fishbowl; the light was meant to filter through the water and crystal and the shadows of small fish would have thrown a dappled, undulating pattern over the entire interior thereby creating a striking underwater effect. In the event, this project proved too complicated but fountains and other mechanized props contributed to the transformational power of the place. The grotto was also to have been the setting for Michelangelo's statues of the Slaves, and it contained Bernardino Poccetti's frescoes of Pyrrha and Deucalion.

Buontalenti's work in the Grotta Grande suggests a sense of drama and theatre that is also evident in his festival productions. The baptism of Filippo de' Medici, for example, was a stunning spectacle. Buontalenti modified the interior of the Baptistry of San Giovanni adding two silvered, balustraded staircases in a platform over the medieval font. The existing columns were to be hidden by pilasters built on volutes. These created niches for the Ammanati stuccoes finished and installed for the occasion. A screen was also rigged in front of the lower gallery giving the plans a particularly Roman accent. Ideas from the Pantheon and Bramante's villa architecture are visible in Buontalenti's plans which pre-date the wider influence of Roman architecture in Tuscany.

The exterior of the Baptistry was similarly dressed. The "Gates of Paradise" were hidden by a temporary portico designed as a triumphal arch which suggested Constantine's in its design and its decorations. The newly made oval double font and its *pietre dure* table were also Buontalenti's and they formed the centrepiece of the ceremony. No expense was spared and the festival grew naturally into a huge civic event. In addition to the hunting and feasting that were organized, elaborate decorations were ordered to complement the rituals. Buontalenti was called on for these arrangements as well and he produced model or "counterfeit" creatures out of wood, cloth, clay, and wax, each capable of movement or the spectacular emission of fireworks. Such displays were not to be enjoyed frequently by Florentines as they were extraordinarily costly. But the weddings of Virginia de' Medici to Cesare d'Este

in 1585, and of Ferdinando I de' Medici to Christine of Lorraine in 1589 were on a similar scale. The 1589 wedding was a reprise of earlier naval battles for wedding celebrations, but the extravagant *conchetto* was vastly expanded in its execution. The bride was led through the streets of Florence which had been decorated with triumphal arches celebrating the past of both families and the parades, pageants, masques, banquets, ballets and musical intermezzi were ceaseless. The lavish culmination was staged at the Pitti Palace in the courtyard leading to the Boboli Gardens. The area was flooded to accommodate eighteen galleys from which victorious Christians played their parts and took a Turkish fort.

Because these celebrations are impossible to re-visit, and the drawings are so brief a guide, Buontalenti's contributions to the artistic culture of his age are generally measured by more enduring monuments. His skill in *pietre dure* design stands out as brilliant and pioneering. The Capella de' Medici was decorated entirely with stone and semi-precious revetments cut into the heraldic emblems and mottoes of the twelve league cities of Tuscany, based on their Etruscan precedents. Even in this monumental and dark setting, the decoration maintains an element of chivalric pageantry which makes permanent the presence of the families who sponsored such displays. The heaviness and endurance of the rock itself defies the transience of the festivals and politics that are left on paper and in archives. Regrettably, such a monument can only hint at the fully realized creations of such a diverse and curious mind.

Biography

Born in Florence, 1531. Training is unknown, but his fresco of *Christ on the way to Emmaus*, in S. Miniato al Monte, Florence, is dated 1547. Taken under the protection of the Medici family; probably learned painting and architecture in the circle of Francesco Salviati, Agnolo Bronzino and Giorgio Vasari. Appointed tutor to Francesco de' Medici, whose passion for scientific studies he shared; remained in Medici family's service for the rest his career from c.1557–1608. Accompanied Francesco de' Medici to Spain in 1562–63; appointed engineer to the Medici, 1568. Worked on Medici villas and grottoes, 1580–97. Designer of silver and hardstone vessels, and porcelain for the Grand-ducal factory, 1575–87. Died in Florence in 1608.

Selected Works

The largest number of Buontalenti's architectural drawings and decorative designs are in the Uffizi, Florence (c. 200); others are in the Louvre, Paris; Victoria and Albert Museum, London; Chatsworth House, Derbyshire; and in Rome and Florence.

- 1565 Decorations for the marriage of Francesco I and Johanna of Austria: Grand Duke Cosimo I de' Medici
- 1567 Casa di Bianca Cappello (renovation, sgraffito façade, and interiors): Francesco I de' Medici
- 1569–80 Medici villa, Pratolino (gardens, grotto, fountains, houses): Francesco I de' Medici
- 1574 Designs for funeral of Cosimo I (catafalque, decorations): Grand Duke Francesco I de' Medici
- 1574–80 Casino di S. Marco, Florence (building and interiors): Grand Duke Francesco I de' Medici
- 1574–89 Tribuna, Uffizi, Florence (interior, central table and cabinet) Grand Duke Francesco I de' Medici
- 1575–90 Medici Villa, Petraia: Grand Duke Francesco I de' Medici

- 1577 Baptismal font for Prince Filippo de' Medici: Grand Duke Francesco I de' Medici
- 1583–93 Grotta Grande in the Boboli Gardens, Florence
- 1585 Design of theatrical events for marriage of Virginia de' Medici and Cesare d'Este: Grand Duke Francesco I de' Medici
- 1589 Design of theatrical events for marriage of Ferdinando I de' Medici and Christine of Lorraine: Grand Duke Francesco I de' Medici
- 1594–1602 Cappella de' Medici, S. Lorenzo, Florence (interior marble decoration)

Burges, William 1827–1881

British architect and designer

William Burges was one of the leading exponents of Britain's mid-19th century Gothic Revival, and an architect who was responsible for some of the most extraordinary interiors of the period. Heavily influenced by the French architect Viollet-le-Duc, and by A.W.N. Pugin, his architectural and interior designs were the antithesis of the graceful and coherent classi-

cism of the 18th century, which Burges called "the dark ages of art". Instead, he was an uncompromising advocate of medieval design and worked in a distinctive style that became known as "Burgesian gothic". Most of his designs were inspired by historical precedent but they were also often enlivened by a quirky and humorous individualism. Indeed, his vivid interiors frequently border on the fantastic and are bright with gilding, painting, stained glass, furniture and textiles. His rooms are warm and rich with red, gold and green generally dominant. The overall effect is occasionally overwhelming, but never gloomy or dull.

Burges's projects were nearly always highly elaborate and he paid great attention to each detail of his buildings, and to each stage of the design process. In many schemes this would include designing not only the structure, but also its decoration and furnishings. No doubt because of this, Burges was a costly architect to employ and many of his most spectacular proposals, such as those for London's new Law Courts, or for cathedrals in Edinburgh, Lille or Brisbane, would have proved prohibitively expensive. Burges himself was also possessed of a comfortable private income and so could afford to be exacting and uncompromising in his designs. Consequently few buildings by him exist.

He travelled extensively in Europe and the Middle East throughout his career, measuring and drawing buildings. Many details of these buildings appeared in his subsequent work and he adopted a skilfully eclectic approach to decoration and design. His principal source of inspiration was medieval European architecture, especially that of 12th- and 13th-century France. But he was also interested in Arab architecture and design and was an early champion of Japanese art which he likened to the art of the Middle Ages in that it was uncontaminated by industrialisation.

Burges's early works were completed during the period in which he was articled to the architect Edward Blore and in partnership with Henry Clutton. His first major independent commission came in 1863 with a competition for rebuilding the Cathedral of St. Fin Barre in Cork, Ireland. The main influence in this project is 13th-century French Gothic and, despite its comparatively small size, the cathedral is built on a grand scale. Sculptural decoration always played a large part in Burges's designs and there are over 1200 pieces at Cork alone. Equally lavish are his two major churches at Studley Royal and Skelton in Yorkshire, and his restorations at Waltham Abbey. With such commissions Burges became an important figure in the renaissance of stained glass manufacture and his churches glow with colours. Their furnishings, such as choir stalls, pews, lecterns and so on, are designed in a bold, muscular style that is highly individual.

Burges's domestic designs were equally opulent, and although the commissions to build and decorate Knightshayes Court, Devon, and Gayhurst, Buckinghamshire, were not completed, Burges's drawings record the richness and colourfulness of his projected interiors.

His most important patron was the 3rd Marquess of Bute, a wealthy and cultured aristocrat who shared his architect's vision of the medieval past. Bute commissioned Burges to transform his Welsh seat, Cardiff Castle, from a small, plain historic house into a neo-Gothic fantasy. It was a project that would last the rest of Burges's life. Beginning with the Clock

Burges: library, Tower House, 9 Melbury Road, London, late 1870s

Tower in 1869, Burges created some fifteen interiors of extraordinary splendour within five towers reminiscent of the architecture of fairy-tales.

All Burges's interiors had themes and at Cardiff the rooms were inspired by incidents from classical and medieval literature and history, depicted in mural paintings, tiles and stained glass. The designs were realised by his team of artisans which included, among others, the sculptors Thomas Nicholls and Ceccardo Fucigna, the painters Horatio Lonsdale, Frederick Smallfield and Fred Weekes, and the stained glass artist G. Saunders. This talented group worked with Burges on many of his most important schemes. One of the principal interiors at Cardiff was the Summer Smoking Room. Burges designed an impressive dark encaustic tiled floor covered with tiled panels which was inspired by the medieval work at Westminster Abbey; the walls were covered with tiled panels illustrating the legends of the zodiac, painted by Smallfield in delicate tones of pale blue, pink and gold. The chimneypiece, a characteristically dominant design featuring a massive hood, was carved

with scenes of courtly love by Nicholls before being painted and gilded.

Some of the rooms at Cardiff Castle included Burges furnishings. The Library (1875–81) remains the only interior to survive intact and includes bookcases and desks made by Gillow and carved by the Bute workshops. Lord Bute's Sitting Room, the Bachelor Bedroom and the Summer Smoking Room also included examples of Burges's textiles, usually made of crewelled serge with Gothic diaper and band designs. Nevertheless, there is little in the way of conventional Victorian upholstered comfort which was always subordinated to the medieval appearance of Burges's rooms. His interest in Middle-Eastern styles culminated in the Arab Room which is lined with marble, has *mishabaya* shutters fitted to the windows and a spectacular richly gilded and painted Muqarnas ceiling. Burges would prepare detailed drawings, cartoons and models for his interiors which would be used by decorators such as Harland and Fisher, and later by Campbell and Smith who worked on several of his schemes.

At Castell Coch, another commission for the Marquess of

Bute in Glamorgan, Burges's academic approach to the restoration of the structure was combined with a more personal style in the interiors which, like those at Cardiff, are elaborate Gothic fantasies. The drawing room is particularly impressive and has a dramatic domed ceiling decorated with birds and butterflies against a sky-blue background. This room was completed after Burges's death by his assistants J.S. Chapple and William Frame.

During the 1870s Burges also began creating his own home in Kensington. Tower House, in Melbury Road, was an astonishing tour de force of his thoughts and ideas and was described as "massive, learned, glittering, amazing" and "strange and barbarously splendid". The rooms at Tower House were not as large as those at Cardiff Castle or Castell Coch, but they demonstrate how Burges was equally comfortable working on a small scale. Indeed, many of the interiors have an intricate jewel-like quality. The Library, whose walls are lined with the witty *Alphabet* bookcases, is dominated by another of his massive chimneypieces, as is the adjoining Drawing Room. Both chimneypieces were carved by Thomas Nicholls, and the walls and ceiling of the Drawing Room were decorated with legendary and mythical lovers, painted by Fred Weekes, echoing the romantic theme of the *Roman de la Rose*.

Burges's passion for Gothic pervades every aspect of his work as a designer. His furniture, in particular, was strongly influenced by 13th-century French precedents and many pieces featured intricate and detailed paintings of mythical or historical scenes. Several pieces were exhibited in the Medieval Court at the International Exhibition of 1862 where they excited much interest and praise. The *Yatman* cabinet (now in the Victoria and Albert Museum) of 1858 is a typical example of his work – colourful, highly decorated and amusing. Painted neo-Gothic furniture is often described as Pre-Raphaelite in deference to the early pieces decorated by Morris, Marshall, Faulkner & Co. but Burges's interest in this style clearly predated that of his contemporaries by several years. Nevertheless, unlike other decorators or cabinet-makers, Burges's furniture was only made to commission and his designs were never repeated or mass-produced.

By the time Burges died in 1881, the Gothic Revival was more or less a spent force. However, the legacy of Burges's own work endured, for not only did he create some of the most memorable interiors of the period, his interest in medieval techniques was later revitalised by the Arts and Crafts movement.

MATTHEW WILLIAMS

Biography

Born in London, 2 December 1827, the son of Alfred Burges, a successful marine engineer. Studied engineering at King's College, London; articulated to the architect Edward Blore in 1844; moved to the office of Matthew Digby Wyatt (1820–77) in 1849. From 1851 in partnership with Henry Clutton; in independent practice, London, from 1857. Made successful competition designs for Lille Cathedral, 1856, and Crimea Memorial Church, Constantinople, 1857; from 1858 designed furniture, jewellery and metalwork, and later wallpapers and stained glass; main interiors from mid-1860s. Member of several antiquarian and artistic societies including the Medieval Society, from 1857, and the Hogarth Club, 1858–63; delivered Royal

Society of Art's Cantor Lectures on "Art Applied to Industry", 1864, and published extensively on antiquarian subjects in the *Gentleman's Magazine*, the *Ecclesiologist*, and *Annales Archeologiques*. Exhibited furniture at the 1862 International Exhibition, London. Died in London, 20 April 1881.

Selected Works

A complete list of Burges's secular and ecclesiastical commissions appears in Crook *William Burges* 1981. A large collection of his designs for buildings and interiors, including many drawings for furniture and decorations at Buckingham Street and Tower House, is in the Drawings Collection of the Royal Institute of British Architects, London; 9 albums of sketches are in the Prints and Drawings Department of the Victoria and Albert Museum, London. An additional collection of drawings is in Trinity College, Hartford, Connecticut. Important collections of Burges's furniture and metalwork are held at the Victoria and Albert Museum, the Fitzwilliam Museum, Cambridge, the Cecil Higgins Art Gallery, Bedford and at Knightshayes, Devon.

Interiors

- 1858–71 15 Buckingham Street, London (decoration, fittings and furniture): William Burges
- c.1858–62 Treverbyn Vean, Cornwall (decorations and chimneypieces): Lt. Col. C.L. Somers Cocks
- 1858–65 Gayhurst, Buckinghamshire (alterations, fittings and furniture): Lord Carrington
- 1864–79 Worcester College, Oxford (hall and chapel)
- 1867–74 Knightshayes Court, Devon (decorations and furniture): Sir J. Heathcote-Amory
- 1869–81 Cardiff Castle, Glamorgan (alterations, extensions, decoration, fittings and furniture): Marquess of Bute
- 1871–77 Harrow School, Middlesex (speech room)
- 1875–81 Castell Coch, Glamorgan (reconstruction, decoration and fittings): Marquess of Bute
- 1875–81 Tower House, Melbury Road, London (building, decoration, fittings and furniture): William Burges

Burges's numerous designs for furniture include the *Yatman* cabinet (1858), *King René's Honeymoon* cabinet (1861–62), *Narcissus* washstand (1865–67), *Zodiac* settle (1869–71), *Alphabet* bookcases (1876), *Philosophy* cabinet (1878–79) and the *Vita Nuova* washstand (1879–80). His wallpapers were produced by Jeffrey & Co, and his tiles by Minton & Co. and W. B. Simpson. He also designed jewellery and metalwork, stained glass and painted decoration.

Burlington, Earl of 1694–1753

British architect and connoisseur

Lord Burlington was perhaps the most influential patron of the arts and architecture in early 18th century England. Of Anglo-Irish origins, he was appointed Lord Treasurer of Ireland and Lord Lieutenant of the East and West Ridings of Yorkshire by George I in 1715. His wealth and position at court enabled him to patronize a number of architects and designers, most notably William Kent (1685/86–1748). He also promoted the architectural designs and ideas of the Italian architect Andrea Palladio (1508–80) and in so doing established the pre-eminence of Palladian Neo-Classical architecture, essentially a reaction to the perceived "unpatriotic" and licentious Baroque tradition exemplified by Wren, Hawksmoor and Vanbrugh.

The young Burlington acceded to the family titles on the premature death of his father in 1704. His interest in the arts was most likely kindled by his mother, a noted patron in her own right and, like most aristocrats, he completed his education with the Grand Tour. It was between this Tour in 1714–15 and his second visit to Italy in 1719 that he was converted to the idea of a new architecture based on the tenets of Palladio. The catalyst for this was undoubtedly the publication in 1715 of two seminal works in English architectural history. The first was volume 1 of the three-volume *Vitruvius Britannicus*, mainly a collection of engravings of 17th and early 18th century English country houses by the Scottish architect Colen Campbell (1676–1729), and the second was the first full English edition of Palladio's *I Quattro Libri dell' Architettura* – *The Four Books of Architecture* – edited by immigrant Italian architect Giacomo Leoni.

During Burlington's Grand Tour his London home in Piccadilly, Burlington House, was being extensively altered and refurbished by the architect and Baroque traditionalist, James Gibbs and a plan of the house appeared in the first volume of *Vitruvius Britannicus*. Burlington subsequently dismissed Gibbs and employed Campbell to oversee the continued refashioning of his London home. The Earl himself now determined to seek out the work of Palladio at first hand and this resulted in his second visit to Italy in 1719.

Andrea Palladio had drawn his inspiration from the buildings of classical antiquity and especially those of the 1st-century architect and engineer Vitruvius. Palladio wished to free Italy from the Gothic influence and lead architecture back to "correct proportions". Introduced into England a hundred

years earlier by Inigo Jones – the "British Vitruvius" of Campbell's title – Palladianism was anglicized by Burlington and his protégés and developed into a distinctive style which set the tone of English architecture and interior decoration for the ensuing half century.

Burlington acquired a number of Palladio's unpublished drawings while in northern Italy and visited the best examples of his built repertoire. He also met William Kent there and so began the partnership which lasted until Kent's death in 1748. Burlington commissioned Kent to paint a number of ceilings in Burlington House. These included the *Banquet of the Gods* in the Great Saloon, the *Assembly of the Gods* in what is now the Secretary's Room and an *Apotheosis of Inigo Jones* in a third room (now over the main staircase).

Burlington, meanwhile, was developing his architectural ideas with the construction of three major buildings, the Dormitory of Westminster School in London, Petersham Lodge in Surrey and Tottenham Park in Wiltshire, the latter based on the layout of Palladio's Villa Poiana. It was in these buildings that Burlington established the principles of English Palladianism, notably the use of four symmetrical wings to the main house (rather than the two used in a traditional Palladian villa) and the associated multi-level roofscapes.

Chiswick House is the apogee of Burlington's interpretation of Palladio's aesthetic. It also introduced the villa into the English vernacular, a style of domestic architecture which has endured. Although relying on Palladio's Villa Capra (Rotonda) for inspiration, with its coffered domes and half-domes, Chiswick incorporates significant variations, for example the use of thermal windows and the octagonal dome and hall of the *piano nobile* (first floor). Probably never intended as a dwelling house, the villa was described as "the beautiful model" by Horace Walpole and can be considered an architectural masterpiece. William Kent was entrusted with the interior decoration which, though sombre, incorporates traditional classical mouldings: egg and dart, Greek key and Vitruvian scrolls as well as Inigo Jones-inspired triangular pediments over the doorways. The opulent ceiling in the Blue Velvet Room, with Kent's painting of *Architecture with Attendants* in the centre is clear testimony to the growing abilities of Burlington's protégé.

It was at Chiswick also that Burlington and Kent initiated the change from the formality of the Italian Renaissance garden to one which emphasized a natural landscape of vista and perspective. Kent was to develop these ideas more radically in his later landscape gardening work.

The Grand Assembly Rooms in York (1731–32), funded by public subscription, enabled Burlington to interpret his ideas in a public building. Again he drew inspiration from Palladio, who had executed a design for a hall "suitable for festivals and entertainment". This design in turn was based on a description in Vitruvius's work of a hall built in the "manner of the Egyptians". Intensely classical with its colonnaded hall lit by clerestory (high-level) windows, the Assembly Rooms reflect the grandeur of ancient Rome, not only in concept but also in interior detailing. The design of the secondary spaces – square, rectangular, round, a double-apsed entrance hall, with one room leading into another – was echoed later in the work of Robert Adam. The concept of the Egyptian Hall, with its long and short axis, displaced the cube-shaped hall hitherto

Burlington: interior of Chiswick House, 1730

employed in domestic architecture and was copied throughout Europe. As a final act of patronage Burlington donated the magnificent Venetian chandeliers and chimneypiece.

Burlington also commissioned the publication of a number of architectural volumes which added to his reputation as an arbiter of taste. Kent's *Designs of Inigo Jones*, based on the Earl's collection of Jones's drawings, was published in 1727 and Burlington's own *Fabbriche antiche* followed in 1730. This contained Palladio's unpublished drawings of ancient buildings which Burlington had purchased during his second visit to Italy.

Burlington retired from public life in 1733 and spent most of his remaining years at Chiswick and his Yorkshire estates at Londesborough. His ideas provoked a mixed response during his lifetime. The strong contrast between the severity and restraint of Palladian exteriors and their often lavish and ornate interiors, for example, was frequently criticised and contemporaries also complained that Palladian houses were dark and gloomy owing to the wide spaces between windows (as, for example, at Houghton Hall, Norfolk). Nevertheless, the partnership between Burlington and Kent marked a turning point in English architecture and, although some doubt still exists about the exact contribution of each, there is no doubt that, whether considered as architect or patron, Lord Burlington exercised a profound influence on the English architectural tradition. As Kent wrote to him in 1732, "What you and I do, it may be esteemed a hundred years hence, but at present does not look like it." Time has proved kinder than Kent's pessimistic forecast.

Biography

Born Richard Boyle in London, 25 April 1694; succeeded as 3rd Earl of Burlington and 4th Earl of Cork with large estates in Yorkshire and Ireland, 1704. Travelled to Italy on a Grand Tour, 1714–15; visited Vicenza to study the work of Palladio, 1719; first architectural projects date from c.1721. Married Dorothy Savile, 1721. Appointed Lord Treasurer of Ireland and Lord Lieutenant of East and West Ridings of Yorkshire, 1715; made a Privy Councillor, 1729; made a Knight of the Garter, 1730; resigned all political appointments in 1733 and devoted the remainder of his life to intellectual pursuits and architecture. Published scholarly works on Inigo Jones (1727) and Andrea Palladio (1730). Died in London, 4 December 1753.

Principal Works

A collection of Burlington's architectural plans and drawings is in the Drawings Collection of the Royal Institute of British Architects, London. Manuscript material, including correspondence, is held at Chatsworth, Derbyshire, and Althorp, Northamptonshire.

Interiors

- c.1721 Tottenham Park, Wiltshire (building and some interiors): Charles, Lord Bruce
- 1722–30 Westminster School, London (dormitory)
- c.1723 29 Old Burlington Street, London (building and some interiors): General Wade
- 1726–27 Warwick House, St. James's, London (internal alterations): Lord Bruce
- c.1730 Foxhall, Charlton, Sussex (banqueting hall)
- 1730 Northwick Park, Worcestershire (remodelling including entrance hall): Sir John Rushout
- 1730 Chiswick House, London (building and interiors; with William Kent): Lord Burlington
- 1731–32 Assembly Rooms, York (building and interiors)
- c.1734 Holkham Hall, Norfolk (building and some interiors; with William Kent, including north dressing room): Earl of Leicester
- 1747 Kirby Hall, Northamptonshire (building and interiors; with Roger Morris)

Publications

The Designs of Inigo Jones (with William Kent), 2 vols., 1727
Fabbriche antiche diseguate da Andrea Palladio, 1730

Burns, Robert 1869–1941

Scottish painter and decorative artist

During his long career the Edinburgh artist Robert Burns worked in many different media and styles. His work ranged from decorative oil paintings in a late Pre-Raphaelite style to German-inspired advertisements, from Symbolist book illustra-

tions to elaborately worked metalwork. One medium, however, which Burns returned to repeatedly was interior decoration.

Burns's interest in interior decoration began during the years 1889–91 which he spent studying in Paris. The Nabis were the new influence in French art at this date and Burns would probably have seen and admired their mural paintings. On returning to Edinburgh in 1892 he became involved with Patrick Geddes's Edinburgh Social Union, helping to paint murals in the Old Town tenements which Geddes was renovating. Burns's murals – scenes from Celtic and Arthurian legend – have since been painted over, but similar paintings by his friends and colleagues still survive.

Burns's involvement in interior design continued after he left Geddes's circle; he exhibited several mural and stained glass designs in the Royal Scottish Academy annual exhibitions – including in 1919 a sketch for the decoration of an, as yet untraced, music room. In 1900 he was commissioned by the Glasgow architectural firm Salmon and Gillespie to design mosaics for a house at 22 Park Circus in Glasgow.

Interior decoration commissions were limited, however, by Burns's other commitments. From 1908 he was head of the Painting and Drawing department at Edinburgh College of Art and he was working as a fine artist, specialising in moody landscapes of East Lothian and in Austrian-inspired interior scenes. In 1919 however, he left his job at the art college and in the following year resigned his associateship of the Royal Scottish Academy, choosing instead to concentrate on applied and commercial art.

This break left him free to accept the commission for which he is now best known, the interior decoration of the flagship premises of D.S. Crawfords, an Edinburgh-based chain of restaurants and tea rooms. The decoration of this eating place, which contained several different restaurants, grill rooms and cafes, took from 1923 until 1927 and the resulting interiors became an important part of Edinburgh social life, described by Edwin Muir in 1935 as “places more strange than a dream” (*Scottish Journey*). The consciously artistic tea room had been very popular in Scotland since the 1890s when Miss Cranston commissioned George Walton and Charles Rennie Mackintosh to decorate the interiors of her Glasgow tea rooms. Novel interior decoration, especially when it created an otherworldly atmosphere, drew customers; David Crawford's aim in employing Burns was “to create an environment which would attract the best class of customer” (“A caterer's experiment”, *Commercial Art*, August 1926).

Crawfords Tea Rooms were made up of two buildings, one on Princes Street, the other on the adjoining Hanover Street, which were linked by a large room called the Oak Hall. This hall was one of the first rooms to be decorated by Burns and contemporary photographs show that it was not conceived as a unified scheme. The only obviously artistic elements are two painted panels over the fireplaces, a series of bas reliefs and a curtain appliquéd with the Crawfords logo. These have to compete with heavy oak panelling, classical columns, plaster urns, a paisley patterned carpet and shaded candelabra-style wall lights. If Burns's involvement in the interiors had stopped at this point it would be difficult to understand why he was praised by contemporaries as an artist who proved that “the commonplace can be recreated enticingly uncommon when

embued with spirited design” (E.A. Taylor, *The Studio*, 1925 p.36).

However, the Chinese Room, a banqueting room on the first floor, completed towards the end of 1926, provides a total contrast, justifying Burns's reputation as an interior designer. In this room Burns gave his attention to every detail – basing the scheme around a magnificent set of painted panels depicting the wreck of the Spanish Armada off the coast of Scotland. These panels, which covered two facing walls, were inspired by Japanese screens of the Edo period. They are predominantly gold, black and red, with full-sailed galleons foundering against black rocks, the sea spray, anemones and barnacles picked out in tooled gold leaf over modelled plaster. The remaining walls were hung with woven oriental textiles that set off two elaborate lacquered and veneered cabinets which were designed by Burns and made by the Edinburgh firm Whytock and Reid. The room is conceived as an integrated scheme – from the stepped-back ceiling and the air conditioning grills to the lacquer coal boxes and specially painted china, everything was made to fit the oriental theme. The contrast between these two rooms is dramatic and the evidence which remains of the other rooms suggests that either Burns gained confidence as the project developed, or that at some point his role changed from that of an artistic adviser enlivening an existing scheme to that of a full blown interior designer.

Burns did not work alone in these schemes but brought in a number of younger artists, many of whom had been students at Edinburgh College of Art. These artists were responsible for working up Burns's sketches into either finished works of art – at least one of the fireplace panels was painted by Burns's protégé W.R. Lawson – or into measured drawings to give to manufacturers. The artists were given little scope for individual creativity. Burns was ultimately responsible for every design, even choosing the colouring of the letters on the bronze hanging signs outside (Letter from D.S. Crawford to the sculptor Pilkington Jackson who had notional responsibility for the hanging signs, National Library of Scotland).

The newly refurbished tea rooms were very favourably received, receiving several eulogistic reviews in *The Studio*. This was to be Burns's last interior commission, however. He received no more commissions from Crawfords, though he continued to design advertisements for them, and in 1929 he suffered a stroke which confined him to bed for six months. While recovering he began to work on a series of book illustrations for his patron Alexander Hunter Crawford which were to take him the rest of his life.

Crawfords Tea Rooms were refurbished in Scandinavian style in the 1960s and have since been broken up into separate shops. Various panels and pieces of furniture survive in the National Gallery of Scotland, the Royal Scottish Academy and in several private collections.

JANE LINDSEY

Biography

Born in Edinburgh, 9 March 1869. Studied painting at the South Kensington Schools, London, and at the Académie Delécluze, Paris, 1889–91. Active as a mural painter with Patrick Geddes's Edinburgh Social Union, 1892. Worked as a painter and commercial artist, producing designs for stained glass and interiors, from c.1893. Elected Associate of the Royal Scottish Academy, 1902 (resigned

1920). Head of Painting and Drawing, Edinburgh College of Art, 1908–19; active as a painter of landscapes. Concentrated upon applied and commercial art from c.1920; suffered a stroke, 1929; active as a book illustrator from 1929. Exhibited frequently at the Royal Scottish Academy, Royal Society of Painters in Water Colours, Royal Glasgow Institute of the Fine Arts, and Aberdeen Artists' Society, between 1893 and 1926. Died in Edinburgh, 30 January 1941.

Selected Works

Panels from the Chinese Room, Crawford's Tea Rooms, are in the Royal Scottish Academy, and some pieces of furniture are in the National Gallery of Scotland, Edinburgh. Examples of Burns's paintings and illustrations are in the Hunterian Gallery, Glasgow, and the National Gallery of Scotland, Edinburgh.

Interiors

- 1900 22 Park Circus, Glasgow (mosaics)
 1923–27 Crawford's Tea Rooms, Princes Street and Hanover Street, Edinburgh (interiors including the Oak Hall and the Chinese Room)

Burns's designs for furniture were made by Whytock and Reid, Edinburgh.

Byzantine Interior Design

The word "Byzantine" refers to the culture of the Byzantine Empire which was founded by the first Christian Roman emperor Constantine in c.330 AD, and lasted for over a thousand years until it was conquered by the Muslim Ottomans in 1453. The term is also used to describe the art and architecture of the Greek, Russian, Armenian and other Orthodox Churches which have perpetuated the formal conventions of the Byzantine era during the post-medieval period to the present day. Centred on its capital city Constantinople, situated between Europe and Asia on the Bosphorus, Byzantium was at the height of its power under the emperor Justinian in the 6th century. The Empire reached as far as Persia in the east, included the upper reaches of the Nile and the hinterland of the North African Mediterranean coast to the south, stretched along the northern Mediterranean coastline from Gibraltar, encompassing the Italian and Balkan peninsulas and extended as far north as the northern shores of the Black Sea.

Despite the duration and extent of Byzantine influence, the principal elements of Byzantine art and architecture were remarkably constant. The greatest threat to representational art occurred in the 8th century when the controversy of Iconoclasm and the triumph of the image emphasised the iconic character of Byzantine pictorial art. With Greek as the

imperial language, the Byzantines regarded themselves as the legitimate heirs of the Greeks of Antiquity and responsible for integrating Christian Orthodoxy into their Classical heritage. Also influenced by the Orient, their philosophy was concerned with defining the indefinable and led to a consuming interest in the finer points of religious doctrine, in which ceremony was given important symbolic functions. The edicts of emperor Constantine VII Porphyrogenitus (913–959), *De Ceremonis* and *De Administratione*, provide insights into the contribution expected from the architectural context and from the visual arts in conveying the symbolic aspects of ceremony. The greater part of written sources and surviving examples of Byzantine culture relate, therefore, to an ecclesiastical context; the secular and domestic aspects of Byzantine civilization are still largely underestimated.

The Byzantines modified and made their own contributions to the Graeco-Roman tradition. The re-use of Roman columns and carved capitals, sometimes alongside their own, serves as a demonstration of their lack of distinction between the two cultures. However, their lack of respect for architectonic principles as seen, for example, in their treatment of carving which tends to obscure the definition between the capital and the abacus, demonstrates the Byzantine preference for ornament. Their favoured building material was brick, with which they perfected the use of pendentives and unsupported semidomes to carry hemispherical domes. A unique achievement of this method, in terms of scale, is Justinian's church dedicated to Holy Wisdom, Hagia Sophia (532–537) in Constantinople. The dome in square plan, as exemplified in the 11th-century church of Hosios Loukas in Phocis, has served continually since Iconoclasm as a model for both the monastic and secular church in Orthodox cultures.

In contrast to the brickwork of the exterior, the magnificence of church interiors was intended to evoke the splendours of the Heavens on earth. On ground level, the brickwork was concealed under marble revetment, slices of marble applied as veneer on the wall giving mirrored patterns of veining. In the upper registers, mosaics of ornamental friezes and biblical scenes, and later narrative schemes of wall painting, covered the brick structure. Most of these forms of treating the internal surfaces are to be found in the Monastery in Chora (converted to the Kariye Djami) in Constantinople, which belongs to the first half of the 14th century. Byzantine descriptions praise church interiors for the quality and colour of effects of light reflected off the polished polychrome surfaces of marbles, mosaic, and ritual objects of enamel, gold and other burnished metals.

Comparatively little material relating to domestic architecture survives from the earliest period of the Byzantine Empire, and it is assumed that the constructions were less permanent than their Roman equivalents. The surviving material on imperial palaces is in the form of written accounts, mostly by Western visitors, notably by the Bishop of Cremona, Liudprand (922–972), by Eudes de Denil (visited the capital under Comnene rule in 1147) and by the Frankish crusaders in 1204, Robert de Clari and Villehardouin. Owing to the ceremonial structure of religion and government, the imperial court required a complex of buildings. The Byzantine Palace was therefore an elaboration of the Roman villa plan found at Tivoli and Piazza Armerina and anticipates the Alhambra and

Byzantine: Sala di Ruggero, Palace of the Normans, Palermo, Sicily, c.1170

the Topkapı Sarayı. Byzantine palaces dating from the early 5th century have been excavated at Lausus and Antiochus, but the most important are the imperial palaces in Constantinople. The site of the Bucoleon, founded by Constantine, stretches from the Hippodrome to the sea walls and accommodated up to 20,000 people.

The second imperial palace in Constantinople dates from the 12th century and was built by the Comnene dynasty on the Theodosian walls at the point of the Golden Horn, commanding the sea, the city and the hinterland. The plan of both was similar, with a great number of buildings housing state rooms, private apartments, military quarters, offices of administration and of government and workshops supplying the court community, arranged around gardens, terraces and connected by stairs, colonnades and covered passages. Western visitors were struck by the number of richly furnished chapels and shrines housing venerated relics, by the imposing scale and magnificence of the bronze doors and porphyry floor of the main entrance, the Chalke Gate, and by the mosaics in the imperial apartments depicting Byzantine emperors and their achievements. Descriptions also emphasise the use of precious metals for functional purposes, such as silver used for floors, door hinges and for the chains of hanging lamps. The furnishing of the Room of Porphyry hung with silks epitomises the importance attached to costliness by the Byzantines, for only children born in this bedchamber were entitled to ascend the throne.

The sources are not specific on the furnishing and arrangement of interiors. In an imperial bedchamber, the focus of attention was not the bed but a central fountain in the form of a peacock from which the water flowed in channels to the four corners of the room. Formal banquets were taken on couches in basilican halls, the largest containing nineteen cubicles for the couches aligned on each side of the principal couch in an apse. From the evidence of representational art, such as the mosaic of empress Theodora and her suite in the apse of San Vitale in Ravenna, it can be seen that textiles hanging from rings on poles served as adaptable partitioning in large halls. Floors were of polished stone or marble, inlaid in geometric patterns. The throne of Maximian of the early 6th century (Ravenna, Archaeological Museum) suggests that ceremonial seating furniture of wood was elaborately carved and inlaid with sculpted ivory plaques. Due to the formality of conduct at court, it appears that little attention was given to other forms of seating. Carved ornament, whether in ivory, wood or stone, was generally executed in shallow relief with drilled holes. Typical ornament relied on geometric pattern, often making repeated use of roundels and interlacing, and favoured motifs included scrolled vines, sharp-leafed acanthus, the peacock and symbols of Christianity, imperial insignia such as the double-headed eagle and elements assimilated from Eastern and Oriental sources.

The impression the Byzantines' predilection for automata left on Western visitors features frequently in accounts of Byzantine interiors. Dishes of food in the great dining halls as well as lamps were operated automatically and the most memorable was the raising aloft of the Emperor himself, seated on his fabulous gilded throne, blazing with jewels.

By the 13th century, the plan of an imperial residence had developed into a narrow, rectangular building with vaulted

halls superimposed on several floors. The ruined Palace of Pophrogenitus, also depicted on the Theodosian walls, has a three-storey elevation ornamented externally with polychrome treatment of the ashlar. The principal apartments were raised onto the first floor. The remains of the imperial palace of the Nymphaion, Kemalpasa near Izmir, inhabited by the emperor John III Vatatzes exiled at Nicaea during the Latin occupation of Constantinople after 1204, is similar and the near contemporary palace at Mistra offers a more complete example. An impression of the marble revetment and mosaic decoration of these Byzantine medieval interiors can be obtained from the heavily restored Sala di Ruggero (1170) in the Palace of the Normans in Palermo, Sicily.

The appreciation of Byzantine art and architecture has had a chequered history. Relations between western Europe and Byzantium were not as antagonistic as the history of the perpetual religious disputes might suggest. Byzantium was renowned for its luxury and exoticism, and objects from Byzantium, often in the form of diplomatic gifts, were highly prized in the West. The late 8th-century silk with the charioteer motif from the tomb of Charlemagne (now divided between Aachen and Paris, Musée Cluny), the 9th-century silk discovered in 1827 in the tomb of St. Cuthbert in Durham Cathedral and the fragments of the 11th-century textile found in the tomb of Edward the Confessor (now London, Victoria and Albert Museum, Textile and Dress Collection 2,3,4-1944) are some examples of the prestige attached to Byzantine textiles in the western medieval world.

Another channel for the dissemination of Byzantine art in the West were the Crusades, and many ecclesiastical treasuries in Venice and in the Kingdom of the Franks were filled with items looted during the Sack of Constantinople by the Fourth Crusade in 1204. As a measure of how these objects were valued in the West, many of them were subsequently mounted in metalwork or incorporated into jewellery and regalia by secular rulers, among whom the Medicis and Louis XIV of France were renowned for their collections.

Following the Ottoman conquest of Constantinople in 1453, access to Constantinople and to other Christian sites in territories of the former Byzantine Empire was closed to Christians. Consequently, the regard for Classical Greece maintained in the Orthodox tradition of the Byzantine Empire was marginalised in the Humanist Renaissance of western Europe. During the Neo-Classical era, European Byzantine monuments and sites, such as St. Mark's, Venice, and later the church on Torcello, and the ecclesiastical buildings of Ravenna and Sicily (San Vitale, Ravenna; San Apollinaire, Classe; the churches at Monreale and Cefalù, Sicily, and the Palace of the Normans, Palermo) were perceived as extraneous achievements of the medieval period. And it was only with the scholarly interest in the classification of historical styles that emerged in the mid-19th century that Byzantine art began to be accepted as a distinct category. Owen Jones's *Grammar of Ornament* (1865), which includes a chapter devoted to Byzantine ornament illustrated with three plates, represents one of the first pattern books to reflect the revival of interest in the art of Byzantium. The author of this section acknowledged the pioneering publication of Christian monuments in Constantinople, W. Salzenberg's *Alt Christliche Baudenkmal vom Constantinopel*, which had been published in Berlin in

1854 as a result of Western European concern for the crumbling Ottoman Empire. And with the increasing enthusiasm for decorative polychromy and dense pattern came a reappraisal of Byzantine colour and interlaced patterns.

Nevertheless, archaeological interest in Byzantium was never developed to the same extent as it was for other cultures, and the art of Byzantium did not stimulate a revival which resulted in stylistic consistency. The hemispherical forms and geometric ornament and polychrome decoration were viewed as synonymous with Norman, Ottonian and Carolingian art in the revived Romanesque style. When Byzantine elements were accentuated, it was usually for political or religious purposes. Representative examples frequently quoted are Paul Abadie's Sacre Coeur in Paris (1875–1919) and John Francis Bentley's Westminster Cathedral (1894–1903), the seat of Roman Catholicism in the United Kingdom, with ivory inlaid choirstalls designed by Ernest Gimson. This also accounts for the use of Byzantine forms and non-Christian motifs as appropriate for synagogues and other Jewish buildings, exemplified in the Jewish synagogue in Berlin. In the United States, the architect H.H. Richardson (1838–86) blended Byzantine influences with the Romanesque Revival, and Charles Vöge's *Byzantine Architecture and Ornament* was published in Boston in 1890. The contribution to the progressive reform movements of the late 19th century – the Arts and Crafts movement and Art Nouveau – is yet to be evaluated.

The popular perception of Byzantium remained shrouded by myth and fable and the taste for brightly coloured and gilded mosaic decoration and for luxurious materials characteristic of the end of the 19th century made Byzantium one of the sources for fantasy. The episodes of Homer's *Odyssey* depicted in mosaic by Gaetano Meo in the dome of the double-storeyed central hall in Sir Ernest Debenham's house built by Halsey Ricardo at 8 Addison Road, Kensington in London (1905–07) reflects a concept of Greek decoration that was far from authentic. The revival of mosaic decoration owed as much to Arab as to Byzantine decorative schemes and the distinction between Christian and Muslim cultures became confused in the vogue for Orientalism. An example was the decoration in glass mosaic by Tiffany for a chapel at the Chicago World's Columbian Exposition of 1893 and this popular fashion can still be seen in the mosaic and marble interiors of the London Railway's Criterion Eating Room (1874) on Piccadilly. The mosaic decoration in the apse of the Guards Chapel, remodelled by G.E. Street in 1875–78, reflects an acad-

emic dimension of the Byzantine Revival that also has yet to be fully evaluated.

C

Cabinets

Originally a small private room, often planned to house a personal collection, a cabinet is now considered as a case for displaying or storing objects. Cabinets are usually distinct from cupboards in that they have drawers, and distinct from chests of drawers in that they have doors. This can present difficulties in description as the types and styles of cabinets can vary enormously.

They originated from the early simple coffers, chests, and cupboards that were found in the ancient world. These fulfilled the requirement for storage, but were not necessarily attractive. The Spanish *vargueno* from the 16th century is an early example of a moveable cabinet that also had a stand to display it upon. It has been said that this model was the first type of cabinet in the true sense. Originally used as church furniture, its particular arrangement made it useful for other situations: supported on a trestle stand, the dropfront, the drawers and small cupboards inside made it ideal for a number of uses. Although the first mention of the cabinet as an item of furniture appears to date back to a French record of 1528, by the early 17th century cabinets were one of the main items of a fashionable interior and were considered to be a reflection of status as well as a focal point of the room. The desire to display meant that the cabinet was placed in a prominent position within either the main bedchamber, withdrawing room or gallery. Ham House, Surrey, has a large ivory cabinet in the principal bedchamber, which is indicative of the costly materials, impressive techniques and high value that was placed upon cabinets in the 17th century. Cabinets were sometimes made in pairs to double the effect or they were displayed with a table *en suite*.

Many cabinets attained the status of works of art in themselves, being finely veneered, painted or inlaid with precious materials. The wide variety of finishes and settings including painting, inlaying, marquetry, *pietre dure*, tortoiseshell, metal inlays, and other embellishments such as mirrors, mouldings, and carving also meant that the status of the maker assumed greater importance. The term cabinet-maker reflects this changed role.

The centres of excellence of this trade in the 17th century were Antwerp and Augsburg. Augsburg continued to produce show-piece cabinets for over a century, with the famous *Wrangelschrank* being the epitome of their craft. In Antwerp

an international trade developed in exclusive cabinets often veneered in ebony with painted inside doors.

Oriental cabinets were introduced into Europe early in the 17th century and although not always lacquered, this particular finish was the most popular. In both France and England the lacquered or japanned cabinet was usually intended to sit upon a stand, often exuberantly carved and gilded or silvered.

Towards the end of the 17th century the highly decorated Baroque-inspired cabinet fell out of favour and was replaced by a larger, flatter, squarer cabinet on a stand. This was decorated with veneers, used to produce floral marquetry designs. Amsterdam and The Hague became centres for specialists in this field of decorative wood veneer. Jan van Mekeren's Amsterdam workshops produced some of the most outstanding work. With the influence of the Dutch court, this taste spread to England, and cabinets on stands decorated either in floral or geometric marquetry were considered high-style.

In France the Royal workshops encouraged production of exotic pieces. Pierre Gole's cabinets on stands with fully formed figures supporting a cabinet with drawers are an example of this exclusive patronage, while the Dutch cabinet style was interpreted by cabinets on stands wholly finished in ebony. These have been particularly associated with Jean Mace. Another exotic taste was established by André-Charles Boulle, whose work with metal and tortoiseshell inlays was widely admired.

Just as exotic was the work of Italian cabinet-makers who produced cabinets finished with *pietre dure*. The diarist, John Evelyn, purchased panels of *pietre dure* and had them mounted into a cabinet, while the famous Beaufort cabinet represents a marvellous example of the process. This cabinet was commissioned by the Duke of Beaufort in 1726 to be inset with *pietre dure* panels from Florence. Other parts of Italy specialised in different cabinet styles. Naples specialised in ebony and ivory cabinets, specifically for the Spanish taste.

Each part of Europe had its own specialty. In Egerland (once Germany, now Hungary) there developed cabinets with drawers or sections in the interior, with doors carved with low relief panels. More generally in Germany there was a taste for white or ivory-finished cabinets. Particularly attractive was japanned decoration applied on a white background.

During the early 18th century, the flowering of the Rococo taste was witnessed throughout Europe. In Italy, cabinets sometimes developed into top-heavy edifices balanced on side

Cabinets: ebony cabinet with inlay and marble plaques by Henri Fourdinois, Paris, 1860s; awarded Grand Prix, 1867 Paris Exposition Universelle

tables, although the work of cabinet-makers such as Pieta Piffetti was oddly magnificent. A more practical, but no less exuberant version of Rococo was found in German cabinets. The large secretaire cabinet, often asymmetrical, crested and covered in marquetry and bronze mounts was a typical product of the period.

In England the taste for Rococo was less well established, but the cabinets of makers such as John Channon reveal an interest in this style of decoration. The cabinet on a stand continued as a type-form through the century. Whether designed to display rare marbles, exotic marquetry, glass paintings or other expensive materials, the idea of impressive display was never far away.

Cabinets for other special purposes were also developed during the 18th century. The china cabinet was a term used both by Thomas Chippendale and Ince and Mayhew to describe units for the display of china. Glass doors indicated display, while storage required solid doors. Print cabinets were low, rectangular cases with doors and sliding shelves designed to be pulled out for examination of the contents. Collectors' cabinets were planned to house particular collections, for example, medals, minerals, birds' eggs and so on.

During the 19th century cabinets were made in a great variety of shapes and styles depending upon the fashionable revived taste. The early Regency particularly offered smaller side cabinets set on plinths or short legs. Useful for storage, they again offered a surface suitable for decoration. Dark timbers combined with brass, white on black penwork, lacquered panels or even pleated fabric, all offered a decorative finish.

Most spectacular however, were the cabinets designed for the international exhibitions that were a feature of the century from 1851. These magnificent cabinets were not intended for sale; rather they were an opportunity for a cabinet-making firm to display their skills and demonstrate the quality of their workmanship. The English makers Jackson and Graham showed a cabinet and mirror in the Paris Exhibition of 1855, which was nearly fourteen feet high, encrusted with enrichments and ornament much of which was gilded. More restrained was the Adam-style cabinet shown by Wright and Mansfield in the Paris Exhibition of 1867. One of the most remarkable examples of this genre is the carved fruitwood and ebony cabinet made by Henri Fourdinois. An example of consummate skill, it took six years to complete and was also displayed in Paris in 1867.

These exhibition pieces were often unique, but there was a growing demand for cabinets for the home. A particular cabinet from the mid to end of the 19th century was the side cabinet. The type probably derived from the French *meuble d'appui* or the smaller Regency cabinets, and was available in a wide variety of styles. These cabinets still had a function but were often made with highly decorated marquetry panels, ormolu mounts, marble tops and the like.

For Gothicists and Arts and Crafts designers the cabinet was an ideal vehicle for displaying their particular taste. William Burges's painted cabinets, J.P Seddon's architect's cabinet with panels painted by Pre-Raphaelite artists and William Morris and Philip Webb's *St George* cabinet give an indication of this trend.

Another development was the work of reformers such as Charles Eastlake and Bruce Talbot. The progressive style of their work was defined by inlay, carving and a trend towards elementalism. The style of cabinets was pushed further by E.W. Godwin who had helped to develop an Anglo-Japanese style characterised by cabinets decorated with Japanese carvings and giving a lighter delicate feel. This led into a more commercial Art furniture movement, both in England and America.

The 20th century has seen the continuation of the cabinet as a furniture form. The results have been varied. Arts and Crafts influence has maintained the cabinet in its traditional role, with makers such as C.R. Ashbee using it as a vehicle for crafts objectives. Other designers, Koloman Moser for instance, introduced their particular style into the form, Art Deco designers revived the use of exotic materials on cabinets, and subsequent practitioners like Piero Fornasetti used the cabinet as a basis for art work.

In contrast to these decorative cabinets was the Modernist ideal of reducing storage to a minimum function. Hence, box-like cabinets were part of a complete storage programme. The work of architects such as Walter Gropius, Charles and Ray Eames, Robin Day, as well as products such as the Plan range

illustrate this. In the last quarter of the century, the choice of styles, as well as the eclectic nature of interiors has meant a revival of historical images offering reproductions of classic cabinets, a development of the Modernist cabinet into mainstream popular models as well the idea of a cabinet being continually adapted to a variety of decorative aesthetics.

Cabinets of Curiosities

"Cabinets of curiosities" were collections of natural and artificial objects, popular in educated and aristocratic circles in 16th and 17th century Europe – they are sometimes referred to by their German name, *Wunderkammer*. The term "cabinet" can refer to the collection, or to the room, or a specially worked cupboard in which the collections were stored and presented. Cabinets of curiosities were emphatically private collections, corresponding with the "closet" or cabinet in the scheme of a palace or country house as the most private of withdrawing rooms. Many of the most influential cabinets were formed by university professors as a teaching resource for natural sciences; but as they became fashionable they were acquired by monarchs and cultivated by many with pretensions to learning. Cabinets could be both encyclopedic in content as well as arranged to impressive visual effect. Dr. Johnson defined a museum in his 1755 *Dictionary* as "a repository of learned curiosities" and a number of significant private cabinets became the foundation for the great public collections of the 19th century.

In 1594 Francis Bacon (1561–1626) wrote of the essential requirements of a learned gentleman. He listed a good library

and a well-stocked garden with a menagerie: "so you may have in a small compass a model of universal nature made private". A gentleman, he said, required "a goodly, huge cabinet ... wherein whatsoever the hand of man by exquisite art or engine has made rare in stuff, or form or motion: whatsoever singularity, chance or the shuffle of things hath produced: whatsoever Nature has wrought in things that want life and may be kept, shall be sorted and included".

Bacon's description of the type of rarity that was prized in such collections is an indication of both their scope and their function. The curiosities were the objects of study, comparison, learning and conversation. While cabinets might include paintings, fragments of classical sculpture, as well as antique coins, they were also likely to contain precious stones, shells and other exotic objects from distant lands and objects of a perceived historical or mythological significance.

The collecting of curiosities has a long tradition in Western Europe. Pliny the Elder described collections of semi-precious stones preserved in temples; Suetonius noted that the Emperor Augustus had such rarities in his palace as the bones of giants and the weapons of fabled heroes. In the medieval period natural curiosities had found their way into churches alongside the relics of saints. Durandus described ostrich eggs in churches "and other things of the like kind which cause admiration and are rarely to be seen ... that by their means the people may be drawn to church and have their minds more affected". During the Renaissance in Italy the revival of interest in classical literature led to a corresponding interest in the surviving small objects of that historical period: coins, inscriptions, and other archaeological fragments.

The range of the contents of such cabinets of the 16th and 17th centuries was broad and is surprisingly all-encompassing to the modern eye, used to the narrow specialisms of museums and collectors in the later 19th and 20th centuries. Indeed, "the very traits of diversity and miscellaneity which serve in our eyes to impair the serious intent of these collections were essential elements in a programme whose aim was nothing less than universality" (MacGregor, 1983).

Cosimo de Medici (1519–74) and his sons had a collection renowned for its ethnographic content, with objects from South America, Africa, India and Japan. John Evelyn described it in 1644 as containing: "hundreds of admirable Antiquities, Statues of Marble and mettall, vassas of porphyry", also, "antique habits, as that of Chineze Kings, the sword of Charlemain (and) ... such rare tourneries in Ivory, as are not to be described for their curiosity". The Medici family were also patrons of Ulisse Androvandi (1522–1605), Professor of Botany and Natural History at the University of Bologna, who published a series of important reference works on zoology and mineralogy, derived from the collections of his own cabinet.

One of the great princely collections outside of Italy was that of Rudolf II (1552–1612) at Hradschin in Prague, where four whole rooms were filled with the curiosities of art and nature. If he was unable to acquire a work of art he admired for his collection he had it copied by skilled artists. His collection was dispersed in the 17th century.

Olias Worm (1588–1654) in Copenhagen, Denmark, where he was Professor of Latin and of Medicine, formed one of the most important collections in northern Europe, which after his

Cabinets of Curiosities: Bonnier de la Mosson's physical sciences cabinet, by Jean Courtonne, 1739–40

death passed to the royal cabinet. There is a published catalogue of 1642, which includes fossils, plants, “sea unicorns” and parts of mermaids, as well as Egyptian antiquities and other ethnographic material. A contemporary observer noted: “many royal persons and envoys visiting Copenhagen ask to see the museum on account of its great fame and what it relates from foreign lands, and they wonder and marvel at what they see”.

Certain private cabinets became the founding collections of important museums. The famous collection of the Tradescant family of Lambeth became the foundation for the Ashmolean Museum (1683), while the British Museum was created from the cabinet of curiosities of over 100,000 items collected by Sir Hans Sloane (1660–1753), physician to the governor of Jamaica, the Duke of Albemarle.

At the height of their popularity, the cabinets were intensely personal fields of operation. Always seen as a source of education, like a library in a well appointed house or palace, they were also for relaxation; John Ray was shown the cabinet of the Elector Karl Ludwig at Heidelberg in 1663: “after dinner his highness was pleased to call us into his closet, and shew us many curiosities ... (including) an excellent and well digested collection of ancient and modern coins and medals of all sorts in which the prince himself is very knowing”. Similarly, John Evelyn on his travels wrote in his *Diary*, in 1644, that he

visited: “Signor Angeloni’s study: where with greater leysure we survey’d the rarities, his cabinets and medaills especially”. But perhaps one of the most engaging descriptions of the sheer enjoyment of collected objects comes in his *Numismata*, in 1697: “nothing can be pleasanter than to see a circle of these virtuosi about a cabinet medals, descanting upon the value, rarity and authenticalness of the several pieces that lie before them.”

Cameron, Charles c.1745–1812

British architect and interior designer

The ambitious son of a carpenter and builder, Charles Cameron was first apprenticed to Isaac Ware, then spent the years 1767–69 in Rome, studying and measuring and drawing antiques with the aim of producing a work that would establish him as an authority on the architecture and decoration of antiquity. Having been trained in the Palladian tradition, he first planned his work as a new edition of Burlington's *Fabbriche antiche* (1730) as well as correcting and continuing Palladio's work on antiquity. He was also influenced by the works of Giovanni Battista Piranesi. His publication *The Baths of the Romans* was published in 1772 after his return to England. The work received mixed reviews, but the plates were admired.

Cameron failed to achieve the success of such predecessors as Robert Adam, and after various vicissitudes he went to Russia in 1778. Catherine the Great was impressed by his publication and his knowledge of antiquity and, having been frustrated in her desire for a Roman house by the French architect Charles-Louis Clérisseau (1721–1820), she made Cameron her architect. Cameron spent the rest of his life in Russia, producing palaces and interiors for the Empress and her successors in the current Neo-Classical style. The works were shaped by his Palladian background as well as his first-hand knowledge gained in Rome. Furthermore Clérisseau's designs of 1773 for a Roman House as well as over 1,170 drawings of antique subjects had been bought by Catherine and were used by Cameron in his various works.

Cameron produced a series of brilliant interiors for the palace at Tsarskoe Selo, including the Green Dining Room of 1780–83, which had raised stucco decoration in the Clérisseau style, but is exaggerated in size and scale and lacks the grace and subtlety of Adam's work based on the same ancient and Renaissance sources of *grotteschi*, inset plaques and urns. The decoration of the door panels was smaller in scale, more successful and less "provincial" in appearance. Cameron's surviving drawings are more delicate and subtle, so the differences may be due to the artists and workmen who executed the work. Cameron's decoration of the 5th Apartment of 1782–84, containing Catherine's bedroom with inset Wedgwood plaques with gilded bronze embellishments, glass panels and mirrored surfaces, is far more successful and original. It has the delicacy of the works of Adam but with the added richness of shining metal and coloured moulded glass. Other rooms had delicate detailed silk panels recalling Clérisseau and Adam. None of these rooms was original in shape as they were primarily the redecoration of Rastrelli's old palace.

Cameron's exteriors for the Agate Pavilion 1782–85 and the Cameron Gallery (1783–86) were Palladian in style combined with severe Neo-Classicism. The interiors were decorated with rich materials, including, besides flat glass over coloured felt, malachite, agate, and moulded glass columns, all of which produced a richness and brilliance of colour – particularly blue and gold and black and terracotta – and a variety of textures and surfaces that was lacking in Neo-Classical interiors in England and Germany.

Cameron's work for Grand Duke Paul at Pavlovsk (from 1781) is perhaps the architect's most complete work (now completely restored). The Palladio-inspired exterior is square, with a dome, but the rich interiors were inspired by the Pantheon and Roman baths and have various geometrical room shapes with domes and niches. The Grecian Hall, for example, with its great Corinthian columns, niches and elaborate stucco ceiling resembles Adam's work at Kedleston. Any lack of subtlety is more than compensated for by the richness and colour of the decoration and the wide variety of precious and shining materials. The furniture, too, is elaborate in style and primarily by Russian designers, perhaps using Cameron's designs.

Cameron's Russian works are brilliant examples of the Neo-Classical style as it spread from Italy, France, and England. His use of a wide variety of rich, precious and colourful materials is unparalleled in the development of Neo-Classical interiors.

THOMAS J. MCCORMICK

Biography

Born in London, c.1745, the son of Walter Cameron, a Scottish carpenter-builder. Apprenticed to his father in 1760; subsequently became a pupil of the architect Isaac Ware. Lived in Rome from 1767, collecting material for a new edition of Lord Burlington's *Fabbriche antiche* (1730), published as *The Baths of Rome*, 1772. Returned to London by 1769. By 1778 had established himself in Russia as court architect to Empress Catherine II; worked chiefly on the royal palaces. Married Catherine Bush by 1784. Dismissed from service by the Grand Duke Paul after the Empress's death, 1796; re-employed as an official architect on the accession of Paul's son in 1801; made Architect to the Admiralty in 1802. Died in St. Petersburg early in 1812.

Cameron: Great Hall, Agate Pavilion, Tsarskoe Selo, 1782–85

Selected Works

A large collection of over 100 drawings by Cameron is held by the State Hermitage Museum, St. Petersburg. An album of designs is in the Alexander Palace Museum, St. Petersburg; 10 additional designs are in the Museum of the Academy of Arts, St. Petersburg; and 37 drawings relating to the Palace of Pavlovsk are in the Palace Archives, Pavlovsk. A design for a ceiling is in Sir John Soane's Museum, London.

Interiors

- 1780–83 Great Palace, Tsarskoe Selo, Russia (1st Apartment including the Salon Blue, Green Dining Room, Chinese Room, Bedroom and Music Room): Empress Catherine II
- 1781–84 Great Palace, Tsarskoe Selo, Russia (4th Apartment including the Salle des Arabesques and the Salle de Lyon): Empress Catherine II
- 1781–96 Palace of Pavlovsk, Pavlovsk, Russia (completed by V. Brenna: interiors including the Italian Hall, Grecian Hall, Cabinet de Toilette and gallery): Grand Duke Paul
- 1782–84 Great Palace, Tsarskoe Selo, Russia (5th Apartment including the Silver Cabinet, Blue Tabatière, Mauve Bedroom, Boudoir, Raphael Room and Cabinet of Mirrors): Empress Catherine II
- 1782–85 Agate Pavilion, Tsarskoe Selo, Russia (building and interiors including the Agate and Jasper Rooms, Great Hall and Cabinet de Toilette): Empress Catherine II
- 1783–86 Cameron Gallery, Tsarskoe Selo, Russia (building, interiors and furniture): Empress Catherine II

1790–1800 Batourin Palace, Ukraine, Russia (building and interiors): Count Mikhail Razoumovsky

Campen, Jacob van 1595–1657

Dutch painter and architect

A native of Haarlem, Jacob van Campen was admitted to the Guild of St. Luke in his native city in 1614 after training as a painter. His first recorded design for a building is for a double house on the Keizersgracht in Amsterdam (1625) for Balthazar and Joan Coymans. He may have been partly responsible for the design of the Huis Ten Bosch (House in the Woods) near The Hague (c.1629–52); but Pieter Post (1608–69) was nominally the architect although van Campen is known to have supervised the decoration of the Oranjezaal, the large central cruciform-shaped space rising to a dome in which the decorations, painted by Jacob Jordaens and other artists, are in a pompous Baroque manner commemorating the Triumph of Prince Frederik Hendrik. The allegorical programme for these decorations had been prepared by Constantijn Huygens, the Prince's secretary, and through him van Campen was introduced to Prince Johan Maurits van Nassau, from whom he received the commission to design the Mauritshuis in The Hague c.1633. Once again, Post seems to have been largely responsible for the execution of the building, and his drawings are the only record of the original interiors, which were destroyed by fire in 1704; but it is known that the vestibule was decorated with murals of Brazilian landscapes. An engraving of 1660 shows that the ceiling of the main apartment was painted with allegorical scenes in panels, and that there were heavily carved garlands on the walls, but the reconstruction after the fire was in the Louis XIV style.

Van Campen designed a number of residences as well as the Nieuwe Kerk at Haarlem (1645), but his masterpiece is the Amsterdam Stadhuis (Town Hall), which was known as "the eighth wonder of the world". The phenomenal growth of Amsterdam began at the end of the 16th century. Between 1600 and 1640 the population of the city had increased at least fourfold, its area had trebled, and it had become the world's most important trading centre. Fulsome comparisons were made between the onset of this golden age and the benefits brought to Rome by Augustus during the years of peace when he restored the arts to their former splendour. In Amsterdam, too, peace, supported by prosperity, was seen as an opportunity to encourage the arts, to embellish the city, and to confirm the fundamental importance of law and justice. It was in this climate that a decision was taken to erect a palatial building symbolic of the city's wealth and serving the dual purpose of a court of justice and the seat of the city council. Van Campen was chosen as architect and his design was approved in 1648.

At the centre of the plan is the great first-floor *Burgerzaal* (Citizens' Hall). This was inspired by the Roman basilican form, with two storeys of giant Corinthian columns; the programme of its decoration is the glorification of Amsterdam as the centre of the world. The marble floor is inlaid with maps of the Eastern and Western hemispheres, and Universal Harmony is the general theme, with sculptured references to Strength, Wisdom and Good Government. Above the four arches leading off to the galleries are the four elements, Earth, Water, Air and Fire, and higher up are figures emblematic of Peace, Prudence, Justice, Atlas, Vigilance and Moderation. Apart from the painted ceiling and coloured marble in the two doorways, all this is white, and it is only in the smaller rooms leading off the galleries that colour forms part of the decoration.

The sculpture, which forms an integral part of the whole design while providing a carefully worked out iconography, is the work of Artus Quellinus (1609–68), an artist born in Antwerp who had trained in his native city and later studied in Rome under the guidance of François Duquesnoy. His work at Amsterdam, although Baroque in spirit, complements van Campen's formal classical architecture surprisingly well.

The most interesting aspect of the plan is the integration within the whole of the rooms required for the dispensation of justice according to a traditional ritual. The *Burgerzaal* and the rooms at the north and south ends together form one cross-axis dedicated to the process, although the former had many other daily and ceremonial uses. Within the various rooms devoted to justice, decoration played an important part. Prisoners accused of serious criminal cases were interrogated in the *Pijnkamer* (Torture Chamber) on the ground floor. The object was to obtain a confession and representations of methods of torture – flogging, shinscrews and thumbscrews – are carved as decoration in the vaulted ceiling. On the day of execution the condemned man was brought to the *Vierschaar* (Court of Justice), a claustrophobic, coffinlike space, entering through bronze doors on which are depicted emblems of punishment; when they closed shut behind him they were fastened by a serpent. On the long wall the officials sat on a marble bench under the Eye of God, which looked unwaveringly at the prisoner. The caryatids supporting the entablature are in the form of captive women, and between them are large carved panels of appropriate subjects. Everything is of death-like white marble in this panorama presented to the prisoner as he faces his judges. Finally he was turned to face the Secretary at the end of the room to hear his fate; if he looked up he could see weeping children and a skull. There was little need for further edification within this marble drama; but as the condemned man passed through the final room and out to the scaffold his last sight would have been of four great two-edged swords inlaid in the marble floor.

Van Campen, after a disagreement, withdrew from the building in 1654 and died three years later without seeing the completion of his masterpiece. He was succeeded by Pieter Post, but not all van Campen's designs for decorative painting were completed. Quellin died in 1668, but he had already handed over to Rombout Verhulst (1624–98) and other capable sculptors. The building was officially inaugurated with great ceremony and much rhetoric in 1655, although work went on for several years. Then, in 1808, Louis Napoleon, the

short-lived king of Holland, recognised its pre-eminence among the public buildings in his capital by appropriating it as a royal palace – a status it still has.

DEREK LINSTRUM

Biography

Born in Haarlem, Netherlands, 1595. Trained as a painter. Member, Guild of St. Luke, Haarlem, 1614. Active as an architect from 1625. Associate of the Dutch humanist Constantijn Huygens. Died in 1657.

Selected Works

A list of Campen's architectural commissions appears in Swillens 1961.

- c.1629–52 Huis ten Bosch, The Hague (decoration of the Oranjezaal; building by Pieter Post)
- 1633 Mauritshuis, The Hague (building with Pieter Post; internal decorations including the vestibule)
- 1648–54 Stadhuis (now Royal Palace), Amsterdam (building and interiors; completed by Pieter Post)

Candid, Pieter 1548–1628

Flemish painter, sculptor, architect and designer of tapestries

Born Pieter de Witte (or de Wit), Pieter Candid was a Flemish painter, sculptor and architect active in Florence and Munich in the latter half of the 16th century, who together with Friedrich Sustris was responsible for establishing the Italian Mannerist style of painting and decoration in South Germany.

According to the contemporary historian Carel van Mander, Candid was born in Bruges c.1548, the son of Pieter de Witte, a tapestry maker. In 1558 his father moved to Florence to work for the Grand Duke, Francesco I de Medici, and changed the family name to Candido. Pieter Candid was trained as a

painter and worked under the direction of Giorgio Vasari. An early commission dating from c.1569 was for a fresco in the chapel of San Luca in the church of SS. Annunziata, Florence; the work itself may have been carried out by one of Candid's pupils, Giovanni Fedini. Soon afterwards, Candid assisted Vasari with the decorations in the Sala Regia in the Vatican (1569), and later with the decoration of the interior of the Dome of Florence Cathedral, c.1572.

In 1576 Candid was made a member of the Accademia del Disegno in Florence and in 1583 he was given an official position there. Several important commissions date from this period. In 1578 he produced an altar painting for the Cathedral in Volterra; in 1585 he painted a fresco of the Madonna and St. Jerome and St. Michael for the church of San Niccolo del Cepo; and in the same year Francesco I commissioned him to paint a series of portraits of members of the Medici family. But in 1586 he was called to Munich by Wilhelm V, Duke of Bavaria (reigned 1579–92) on the recommendation of the sculptor Giovanni da Bologna. Candid remained in Munich for the rest of his life, completing a range of important and varied commissions, many in association with the painter and designer Friedrich Sustris whom he had met previously in Florence. He worked with Sustris on the decoration of the Antiquarium, or classical museum, in the Residenz, supplying a number of paintings of allegorical subjects that were set into the ceiling amidst the rich Italianate grotesque decorations supervised by Sustris. A sketch exists for an allegory of Hope (Spes) from this scheme. Candid is also recorded as working on the Grottenhalle at the Residenz which was mainly designed by Sustris.

When Wilhelm turned to religion and began to support the Jesuit order, Candid received a number of associated commissions. An altar painting of the Martyrdom of St. Ursula for the Church of St. Michael was executed in 1588, and no less than eight other commissions for the Jesuits were carried out during these years. In 1595 he produced an altar painting for St. Ulrich, Ugsburg; in 1600 another for the Capuchin Church in Munich. And later, in 1620, he executed a large painting depicting the Ascension of the Virgin to celebrate the military victory at Weissenberg that stood on the high altar of the Frauenkirche, the Cathedral of Our Lady, Munich, until 1858.

Candid was also active as a sculptor, and as a designer of sculptures that were produced by his workshop. The attribution of many of these works is unclear but notable examples include the statue of Perseus in the centre of the garden of the Grottenhalle (although this piece is also associated with Sustris), the Allegory of Bavaria in the Rotunda of the Hofgarten executed by Hans Krumper, and the Mausoleum of the Emperor Ludwig of Bavaria in the Frauenkirche, erected by Krumper in 1619–22.

Throughout this period Candid was also active as a designer of tapestries, a branch of art that was particularly encouraged by Wilhelm's successor, Maximilian I. From c.1604 until 1614 Candid was engaged on two series of twelve tapestries, one of grotesques and the other commemorating the deeds of Otto von Wittelsbach, the 12th-century founder of the Bavarian ducal line. These were made for the Residenz and are now preserved in the Burg Traunkirchen, Landshut, where Sustris had previously worked in 1573–80. A second series of tapestries, woven between 1612 and 1614, depicted the Twelve Months,

the Four Seasons and Day and Night. In 1614 Candid began work on a series of Heroes and Heroines from the Old Testament and from classical history for the Kaisersaal in the Residenz; the painter Hans Kappler assisted in the preparation of the cartoons. Despite the fact that later historians have sometimes described these tapestries as vulgar and heavy, this series arguably represents Candid's finest achievement in this medium. Whether working on a grand scale or, as with the Seasons, more intimately, Candid's great strength lay in his ability to incorporate all the richness of Italian decoration in the borders and edges of his tapestries, while at the same time employing the more simplified figurative systems demonstrated in Raphael's Sistine Chapel tapestries in the central sections. This approach prepared the way for the grand style later used in Rubens's tapestry designs.

Candid was also responsible for several painted decorative schemes. These included decorations in the Altes Schloss at Schleissheim (1617), and a set of allegorical ceiling paintings in the Goldener Saal in the Augsburg Rathaus, or Town Hall of 1619. The latter were executed by the local Augsburg painter Matthias Kager (1575–1634).

Candid's style, particularly in some of his designs for statuary, owes much to the Mannerist tradition of sculptors such as Giovanni da Bologna. But the style of his drawings, many of which survive, appears closer to the Northern Italian style of artists like Paolo Veronese combined with strong influences derived from his study of High Renaissance masters such as Raphael and Michelangelo. Like Sustris, he played an important role in introducing the Italian style to the Munich court and in popularising a refined and colorful style of art that led naturally and easily into the German Baroque.

Biography

Born Pieter de Witte (or de Wit) in Bruges, 1548, the son of a tapestry maker. Moved with his father to Florence, 1558, and trained as a painter. Worked under Giorgio Vasari (1511–74) in Rome and Florence, 1569–74. Member, Accademia del Disegno, Florence, 1576. Active as a tapestry designer under Jan van der Straet (1523–1605), Florence, c.1576. Active as a painter in Volterra, 1578, and Florence, 1585. Summoned by Duke Wilhelm V of Bavaria to Munich, 1586, where he worked as a painter in the Residenz under the direction of Friedrich Sustris (c.1540–99). Active as a painter of altarpieces from the late 1580s, and later as a sculptor; designed tapestries for the Munich workshops of Hans van der Biest from 1604. Continued to work as a painter in Munich until the 1620s. Died in Munich, 1628.

Selected Works

- 1569 Sala Regia, Vatican (painted decoration under the direction of Vasari)
- 1586 Antiquarium, Residenz, Munich (painted decoration under the direction of Sustris)
- 1586 Grottenhalle, Residenz, Munich (grotto decoration under the direction of Sustris)
- 1617 Altes Schloss, Schleissheim (painted decoration)
- 1619 Town Hall, Augsburg (designs for decorations for the Goldener Saal)

Candid's tapestries included a series of grotesques (1604–15); a series commemorating the deeds of Otto von Wittelsbach (c.1604–11); a series of the Twelve Months, the Four Seasons, and Day and Night

(1612–14); and a series representing Old Testament Heroes and Heroines (begun 1614).

Candles, Candle-holders and Candle-stands

Until 1800, artificial lighting in interiors was almost completely dependent on candles, a form of illumination that was always costly since good wax candles were very expensive. Tallow candles (made of animal fat) and rushlight (meadow rush soaked in fat) were less expensive but smelt badly and were quickly consumed. This meant that candle-holders were rare objects in ordinary households and even in larger houses there were surprisingly few.

Over the centuries many terms have been used to designate hanging and standing candle-holders. Although the historical terminology is often confusing, three different types can be discerned: the candlestick to place on a flat surface; the sconce to hang on the wall; and the chandelier which is suspended from the ceiling. Designs of candle-holders and -stands changed over the centuries and followed fashion. Major artists and interior designers contributed designs, among them Albrecht Dürer, Christoph Jamnitzer, Jean Berain, Daniel Marot, Johann Michael Hoppenhaupt, Juste-Aurèle Meissonier, Robert Adam, and Augustus Pugin. These designs were often carried on by others and produced in more than one country.

A basic form of lighting was the lantern, a receptacle for a light-fixture, enclosed partly by small panes of glass or translucent material to protect the candle from drafts, set in a frame of metal or wood. Lanterns were hung in important passages, staircases, and halls; side lanterns were attached to walls.

Probably the best-known support for candles, usually singly, is the candlestick, a free-standing support with a nozzle into which the candle is inserted. The stem is often in the form of a baluster, column, or human figure and over the centuries this has produced considerable variety. Materials, too, have varied considerably, notably metal – brass, silver, Sheffield plate, or pewter – but also including ivory, rock-crystal, glass, Delftware, porcelain, and wood.

Candlesticks for ecclesiastical purposes normally have prickets (spikes) rather than nozzles to hold the candles. The chamber candlestick, with a short stem, wide pan, and a handle, was intended for the bedroom. A candlestick for more

Candles: designs for girandoles by Thomas Chippendale from *The Gentleman and Cabinet-Maker's Director*, 1762

than one candle, generally with six branches, is called a candelabrum; *candélabre* in French.

The etymology of lighting can be confusing, to say the least. During the Middle Ages, and even up to the 16th century, the term "candlestick" was occasionally applied to what we call a chandelier – a hanging light fixture with several branches suspended from a ceiling or roof. Originally the French term for candlestick, the name chandelier (from the French *chandelles*, tallow candles) has also been used for a wall-light or sconce. In England, these hanging fixtures were generally known as hanging candlesticks or branches and it was not until the 18th century that the term chandelier came into use in England. After the mid-18th century they became known in France as *lustre*, a term also employed in England.

Chandeliers were generally made of brass or carved and gilded wood; and the most precious ones were of silver and rock-crystal. The earliest surviving chandelier dates from the 11th century – a large hanging ring onto which the candleholders are attached. In the 15th century a type was developed with a moulded stem and several branches in one or two tiers; this was made well into the 18th century. From the late 17th century onwards, pyramidal chandeliers made of rock-crystal became fashionable. A century later rock-crystal was replaced by cut glass and Venice became a centre of production.

The sconce, or wall-light, consists of one or more branches springing from the lowest point on a reflector back plate. Like candlesticks, they have come in a wide variety of materials, including silver, pewter, carved wood, earthenware, and cut glass, sometimes combined with other materials such as enamel or embroidery. A looking-glass in a wooden or silver

frame occurs as a backplate from the late 17th century onwards, often pleasingly shaped, sometimes decorated with a chased armorial device or monogram. Occasionally the branch takes the form of a human arm, the hand holding a socket or a scroll on which the socket is placed. Sconces were used for general illumination, but for activities such as reading, sewing, or writing, additional light from a candlestick or girandole was necessary.

The girandole, a pyramidal candelabrum, derives from the Italian *girandola* a type of firework like a horizontal Catherine wheel. In the late 17th century it referred to an elaborate type of candelabrum with pendants of cut crystal or glass, forming a pyramid of light – as described in the French royal inventories of 1660. In the 18th century the term girandole applied to all candelabra as well as to chandeliers and lustres, with or without crystal pendants. In mid-18th century England it referred in particular to large carved and gilt-wood sconces in the Rococo style; also to a wall bracket with mirror back. Later in the century the mirror was often circular and convex and was sometimes used alone.

To elevate a lamp or candle to a convenient height, a torchère or portable stand was often employed. Normally these were made in the form of a table with a tripod base, turned or baluster shaft, occasionally in the form of a human figure, and a small, circular, square, hexagonal, or octagonal top with moulded border, often adjustable in height. Occasionally torchères were made in the form of a Negro holding up a circular tray. This type, originating from Italy, was fashionable during the second half of the 17th century and often called a *guéridon*, the French name for a Negro pageboy.

The most valuable torchères were made in silver, but they were more often in wood, enlivened with sculptural details such as gesso work, lacquer, or marquetry. Although torchères were primarily candle-stands, they have also been used to support objects such as vases or dishes. From around 1670 into the 18th century, torchères were often made in pairs, or *en suite* with a table and mirror, or with a cabinet. In 14th- and 15th-century France the word *torchère* or *torchière* referred to a type of candlestick which was larger than usual. Later the word was also used for a large candelabrum and, in the last quarter of the 17th century it became what it is today, a stand on which a candlestick or candelabrum could be placed.

Cassina

Italian furniture manufacturer; established 1927

Cassina is one of an influential group of family-owned Italian businesses that have dominated avant-garde and High-Style furniture manufacturing in the post-war period. Based in Meda, near Milan, since the 18th century, by the 1930s the Cassina family was producing upholstered pieces for major Milanese department stores such as La Rinascente and Mobilificio di Fogliano. Under the inspired partnership of the brothers Umberto and Cesare, the marketing possibilities of modern design were fully exploited by the company. By restructuring the production and distribution systems (partly aided by a large naval order between 1947–52) they were able to capitalise on the post-war growth of Italian and interna-

tional middle-class elites who were increasingly interested in modern, stylish furniture by major Italian and international designers. After early collaborations with Paolo Buffa and Franco Albini, the firm turned to the prolific architect-designer Gio Ponti, and the practice of producing design-led pieces for which Cassina is now famed began.

Ponti's *Distex* armchair combined 1950s angularity with upholstered Italian élan and the *Superleggera* side chair, a synthesis of traditional and contemporary styles, was a particular international success which Cassina has mass-produced since 1957.

During the 1960s the Italian furniture industry embraced the new materials and technologies of an increasingly imaginative and uninhibited era and Cassina's continuing collaborations with the new generation of Italian designers advanced this process. Cassina particularly excelled at producing sophisticated contemporary models that nevertheless still had traditional appeal. Examples of this furniture include the 1963 Vico Magistretti 892 chair made in beech or walnut with a stained or lacquered finish, and the plush, yet modernistic leather pieces designed by Mario Bellini in the 1960s such as the *Cab* chair of 1967 which has zips up the sides of the leather-covered steel skeleton. Luxury and comfort also combine in the designs by Tobia and Afra Scarpa such as the model 917 of the early 1960s.

By purchasing the exclusive reproduction rights from the heirs of Charles Rennie Mackintosh, Gerrit Thomas Rietveld, Erik Gunnar Asplund, Frank Lloyd Wright, Le Corbusier, and Charlotte Perriand, Cassina created a collection of masterpieces of late 19th- and 20th-century furniture design named the "Cassina i Maestri." The Le Corbusier chaise longue of 1929 was the first classic piece to be reproduced by Cassina (since 1965). The work of reconstructing the furniture pieces LCI, 2, 3 and 4 was carried out by Cassina when Le Corbusier was still living and other models were added in 1974, 1978 and 1985 under the supervision of the Fondation Le Corbusier with the collaboration of Charlotte Perriand. Coloured versions of some of the pieces were introduced in 1985 using pastel colours close to shades illustrated in Le Corbusier's original palette and which matched the taste of the 1980s.

Each piece of furniture in the "Cassina i Maestri" collection bears a copy of the signature of the author, a production number, information on the materials used and the original design, biographical details of the designer and a bibliography and list of museums and galleries which have exhibited the piece. Through its commitment to authenticity, and by promoting such classic pieces as the Corbusier *Grand Confort*, chaise or the Rietveld 635 *Red and Blue* chair of 1918 (first reproduced in 1978) Cassina has cleverly tied in its own products with the celebration of the grand tradition of European Modernism. Many of the interiors associated with the "designer decade" of the 1980s would inevitably feature a Cassina reproduction of a Corbusier chaise longue or a Mackintosh Hill House ladder-back chair.

Some of the company's own most renowned pieces of furniture were produced during the Italian design renaissance of the 1970s and 1980s. These include the *Aeo* chair by Paolo Deganello of the early 1970s with its soft slung form, or the *Manhattan Sunrise* sofa by Gaetano Pesce of 1980, inspired by pop sculpture and the Manhattan skyline. Vico Magistretti's

Cassina: *Superleggera* chair designed by Gio Ponti in 1955

1981 *Sinbad* armchair marks a continuing interest in the manufacture of luxury designs. Inspired by brightly-edged English horse blankets, this sumptuous sofa combines innovative materials with rich colour, and evokes a sense of effortless luxury. It is a Modernist interpretation of comfort allied with wealth and style, as are Magistretti's *Maralunga* chair and ottoman and the Mario Bellini series of marble tables.

Many of these innovative pieces were launched by Cassina at the annual Milan Furniture Fairs, and their showroom in Milan is a showpiece of contemporary Italian exhibition- and retail-expertise. An international team of designers has also been called upon, such as in the famous *Wink* armchair by Japanese designer Tokiyuki Kita. On the death of Umberto Cassina in 1991, Vico Magistretti remarked on the opposing yet complementary skills of the two Cassina brothers: "Umberto decided how and when to manufacture while Cesare selected the designs, thus creating a perfect management division". Cassina was brought into the American Steelcase Group in the late 1980s.

Cassoni

In current usage, "cassone" refers to the several styles of large chests used as decorative furniture in wealthy Italian Renaissance homes. Household inventories suggest that these massive forms were most often grouped in bedchambers, flanking either beds or walls in the otherwise sparsely furnished interiors. They also indicate, however, that the term cassone was not used consistently during the period; at any rate scholarship has not yet reached any conclusions about its precise meaning between about 1400 and 1600. In fact it appears only rarely before 1500, and was little used in southern Italy even after that date. A much more common term, *forziere*, generally referred to painted or leather-covered chests reinforced with iron straps, but cassone was also occasionally used to describe these. The distinction may have been refined in later years, as the carved walnut chests characteristic of the high Renaissance seem not to have been described as *forziere*.

As dowry chests, cassoni were an important focus of marriage preparations and ceremonies, although it should not be supposed that all cassoni were made for weddings. Many exhibit two families' coats of arms, usually placed symmetrically on the stiles or the side panels, and carved or painted figures on the stiles sometimes serve as armorial supporters. Later examples in the style of antique sarcophagi often display arms where classical Roman carvers would have placed inscriptions or portraits. A cassone in the Victoria and Albert Museum depicts the family arms of Elisabetta Gonzaga impaled by those of her husband, Guidobaldo di Montefeltro, but most armorial designs are less graphically suggestive. Despite the arms which document their marriage, this is a simple board chest decorated with paint and gilding and was probably not made for their wedding – unless it was part of a group including several grander examples. Dowry chests were usually commissioned in pairs, but patrician families owned large numbers of cassoni: Isabella d'Este, for example, arrived in Mantua for her wedding in 1490 with 13 painted chests. But it is likely that the corpus of cassoni which survive – nearly all richly decorated with panel paintings, gilding, inlay or carving – presents a distorted picture. Chests with painted panels, in particular, were rarely mentioned in inventories or depicted by artists. Even less elaborate cassoni, however, were expensive and treasured possessions. Most were lined with fabric, and a

Cassoni: painted cassone from the workshop of Apollonio di Giovanni (c.1416–65), showing the meeting of Solomon and the Queen of Sheba

few were painted in imitation of brocade, which suggests that fine textiles sometimes decorated the exterior.

Because Italian women's direct inheritance was increasingly restricted after the 13th century, the dowry took on added importance. Packed in paired cassoni, dowry goods were carried to the conjugal home in public wedding processions which literally described the transfer of wealth between newly allied families. This practice, which seems to have been confined to the aristocracy and the upper-middle classes, continued as late as the mid-15th century in Florence. In procession, extravagant cassoni intimated the dowry's value without actually displaying its contents publicly, and served as vehicles for social competition. Although in most cases the bride's father commissioned these, after about 1450 this was often the groom's responsibility. Cassoni presented as a groom's marriage gift could still be paraded through the streets, if less formally.

The workshops which produced cassoni responded slowly to new artistic developments, and the flat, even patterning of Gothic chests remained popular outside Florence and Siena into the late Quattrocento. Iron straps were less common after 1400, but the façade division they imposed – usually tripartite – was retained in many later chests. In Venice and the Adige Valley, “engraved” designs were cut into softwood with hot needles and filled with pigment; cypress, which repels insects, was favored. Venetian workshops also specialized in gesso relief, gilded and painted in vibrant colors. Both types were essentially mass-produced: engraving was laid out with

templates, and mould-made relief elements were easily rearranged. Tin-leaf, varnished yellow, could replace gilding, which was more expensive than even painting or carving. The imagery on these richly textured chests included the iconography of chivalric courtship: female archers and heart-struck men, lovers at a fountain and falconers on horseback. On later cassoni, symbols of the garden of love gave way to painted narratives from Ovid, Boccaccio, Petrarch, classical mythology and biblical subjects. Storiated panels could be confined within moulded quatrefoils or roundels or extend across the façade; side panels often continued the tale. Paired cassoni were conceived as a seamless narrative or developed a relationship between two subjects. Apollonio di Giovanni's workshop (1446–63) specialized in such painted cassoni, and served clients from all the great Florentine families. Although little is known about other workshops' production, individual cassone panels have been attributed to Sandro Botticelli, Domenico Veneziano, Jacopo del Sellaio and Paolo Schiavo, among others.

The stories illustrated on cassoni offer a complex view of marriage, and often represent cautionary tales rather than romantic statements. The brutal rapes of Lucretia and the Sabines may have been reminders of wifely duty: submission, fidelity and childbearing. Dido and Griselda modeled devotion, while Callisto and Daphne showed the risks of passion. In general, cassoni panels imply that romantic love is fraught with danger, while loyalty and selflessness are heroic choices. These messages were later supplanted by epic classical themes,

but they should not be underestimated. Many Renaissance Italians believed that images seen during pregnancy would influence the child, and the paintings of Paris and Helen found inside the lids of several paired cassoni were probably charms for beautiful children. Storiated panels may have offered similar spells for a successful marriage.

In the second half of the 15th century, cassoni became larger and more architectural in form, with coffered, moulded lids and tall plinths. Walnut chests with intarsia decoration remained popular throughout Italy after 1470 into the 16th century, but by the early 1500s cassoni *a moda di tomba* were all the rage in Tuscany and Rome. Carved in high relief with caryatids or dolphins bulging on each corner, broad volutes, classical mouldings and lions'-paw feet, these chests show the influence of sculpture rather than painting. Their strongly Mannerist façades, often crowded with writhing, heroic figures, were left unpainted: dark walnut was preferred, gilded sparingly if at all. Little progress has been made in attributing carved cassoni, but Rome was probably a center for their production. Both carved and intarsia cassoni were made as pairs, often "right and left handed" for symmetry.

According to Vasari, the cassoni tradition led to the use of *spalliere* – framed, rectangular panels used as friezes – as well as other painted furniture, and furnishings were often conceived in tandem to create a unified effect. For a 1515 wedding, Andrea del Sarto's workshop was commissioned to paint two panels to hang above a pair of carved walnut cassoni, and similar panels were used throughout the bedchamber. The painted walls of the Palazzo Davanzati in Florence echo the motifs on early marriage cassoni: the arms of a husband and wife, roses, lilies, fruit trees and peacocks – emblems of Juno, to whom wedding vows were sacred.

19th-century antiquarians and art collectors were fascinated by cassoni, which they collected avidly. William Morris and Philip Webb's *Saint George* cabinet (1861) is a direct, if romantic, interpretation of painted cassoni, and inspired many Victorian designers' fanciful "medieval" furniture. Unfortunately, the restorations undertaken by early collectors also tended to be fanciful: new carcasses were constructed to support painted panels, gesso relief was replaced and gilding added, especially on walnut chests where little or none may have been evident. Along with the removal of panels to be hung as paintings, these improvements have created tremendous obstacles to connoisseurship. Scholars' interpretations of individual panels' original context often differ substantially, and in many cases the material evidence which could resolve the issue is long since lost.

Castaing, Madeleine 1897–1992

French interior decorator and antique dealer

Decorator, antique dealer and connoisseur of modern art, Madeleine Castaing was the most influential exponent of the eclectic decorating style that emerged in fashionable circles in the post-war period. During the mid and late 1930s a number of experts and connoisseurs had come to the conclusion that modern furniture did not have the scale and presence to hold its own in an important interior. This view was encapsulated in the furniture historian Ralph Edwards's article of 1936 entitled "Old Furniture and the Modern Background" (published in the magazine *Decoration*) which predicted the mixing of styles that was to become fashionable after the war. Raymond Mortimer's article, "Modern Period Character Mania: The Alternative to Period Style", (*Decoration*, 1937) not only endorsed this theme, it defined and developed it further. Mortimer also emphasised the role of the decorator as arbiter of taste, proclaiming: "Having accepted the principle of mixing styles – aesthetic judgment supplanting period consistency – we realize that all things that are good of their kind do not necessarily mix. They must have been conceived in the same spirit – have some abstract aesthetic relationship".

Castaing was particularly well-placed to make such judg-

Castaing: dining room for Madame Ferenzi, Paris, 1948; watercolour by Aleksandr Serebriakov

ments. Her credentials as an interior decorator were strongly underpinned by her professional skills as an antique dealer and by her serious interest in modern art. She moved in the inner circle of Parisian artistic life, combining her reputation as an arbiter of taste with a more cerebral involvement in supporting and promoting the Lithuanian Expressionist painter Chaim Soutine. Furthermore, her knowledge of period and modern styles was coupled with considerable artistic flair, and, as a result, her expertise and judgment were eagerly sought after by a wealthy Parisian clientele.

Castaing's first antique shop opened in the rue du Cherche Midi in 1941, when Paris was under the shadow of German occupation, but it was with her new premises, established at the corner of the rue Jacob and the rue Bonaparte in 1947, that

she is most closely associated. The situation all over Europe was still intensely grim during this period and yet a pent-up creative energy, suppressed through the years of war and its aftermath, produced an extraordinary renaissance in the arts of living. Thus, Castaing's first decorative commissions coincided not only with Dior's "New Look" that was to revolutionize fashion, but also with the important fresh direction taken by interior decoration in England that was led by John Fowler and Nancy Lancaster.

The Castaing shop was extremely distinctive. The exterior was painted black and the low-set windows offered a view of a dimly-lit, rambling interior containing a seemingly careless arrangement of furniture and *objets d'art* of every description and value ranging from museum-quality antiques to flea-

market finds. Castaing aimed to create an impression of private rooms from which the occupant had just departed – in other words, of rooms that were not overly formal or immaculately tidy. The stock was unpriced and Castaing parted with her favourite pieces only with huge reluctance and for very substantial prices. This did nothing to diminish their desirability for her devotees, among whom she was proud to name the artist and film director Jean Cocteau. She insisted that she must feel a total rapport with her clients and she brought a dedicated perfectionism to the achievement of the desired effect.

Almost impossible to categorize, the Castaing style consists of an apparently random mixture of furniture from all periods, with wallpaper and textiles in a subtle blend of nostalgia and modern chic. A pared-down, simple architectural framework showed the antique furniture to great advantage, though she sometimes indulged in dramatic touches, like marbled wallpaper, for her own front hall, or woven canework wall-panels at the Villa Santo Sospiro. The element of chic makes the French version of post-war eclecticism quite distinctive. Castaing's own designs, coupled with an unrivalled eye for quality and individuality, made her interior schemes inimitable, and her patrons were prepared to accept her wilfulness and the enormous cost of her ideas in the knowledge that only she could create this particular neo-19th century look with total conviction.

The Castaing revival style was a mixture of Neo-Classical, Biedermeier and Regency, combined with judicious touches of Second Empire buttoned upholstery and papier-mâché inspired by the evocative descriptions in Balzac's novels. She was responsible for stimulating interest in English mahogany among French decorators. Any suggestion of scholarly antiquarianism was put to flight by her bold use of colour; much black, with sienna, grey, "Pompeian" red and sky-blue, and her particular favourite "Castaing green", like turquoise water, which she used for the walls of her shop. Her signature touches were a taste for flowered needlework, and striped carpets of her own design with low seating in quilted satin and lacquered coffee tables, also her own designs. The shock factor was provided by the frankly esoteric in the form of staghorn furniture or oversize painted shell chandeliers.

The effect was quite unlike the austere correctness of the Regency Revival or the claustrophobic stage-setting of "Victoriana", with wax or woolwork fruit under glass domes, as espoused by posing undergraduates largely as a joke. Smart "Victoriana", created by artists and fashion people – Digby Morton, Lady Ashton and John French in London, and Carlos de Beisteguy, who was responsible for the famous pastiche, Château de Groussay, in Paris – was quite different, and can be seen as a parallel strand to Castaing's work. "I don't care about periods", she remarked, "If a room is finished and there is no life to it, there is nothing there". Her decorating philosophy was exemplified in her Parisian apartments – the ghostly *prémises* full of cobwebby and shrouded furniture, like Miss Havisham's dining room from Charles Dickens's *Great Expectations* – and at Lèves, the Castaing's country property near Chartres.

CHARLOTTE GERE

Biography

Born in Paris, 1897. Married Marcellin Castaing. Worked as an interior decorator and opened her first antique shop in Paris, 1941; business moved to premises at the corner of rue Jacob and rue Bonaparte, 1947. Died in Paris, 1992.

Selected Works

Business records and drawings relating to Madeleine Castaing's decorating commissions remain in the hands of the firm, now known as the Fondation Castaing, which is based in the rue Bonaparte premises, Paris.

Cast-Iron Furniture

During the 19th century cast-iron furniture was a characteristic feature of many domestic interiors. It was designed to be especially suitable for gardens, conservatories and halls, although useful and purely decorative items could also be found in other parts of the Victorian home. Garden benches and tables, hall stands, stick and umbrella stands, jardinières, wash stands, radiator covers, *objets d'art* and mirror frames, were all manufactured in large quantities and there was a thriving home and export market in Great Britain, although the United States, Germany and a number of other European countries were also important centres of production.

During the 18th century cast iron was used within the home environment, but its application was largely restricted to the manufacture of cooking pots, oven ranges and grates. It was during this period, however, that companies such as Coalbrookdale in Shropshire, and Carron in Falkirk, were established in Britain, and it was to be only a matter of time before they turned their hand to the production of furniture. In the early years of the 19th century the virtues of cast iron as a material had been fully recognised by architects, and its incorporation into the design of the Brighton Pavilion and its use by Paxton in the Crystal Palace project is well known. The development of cast-iron furniture was a spin-off of the decorative architectural ironware business established by firms like Coalbrookdale. Furniture production at Coalbrookdale was introduced in the early 1830s alongside the manufacture of a range of so-called artistic wares and they produced everything from cake plates and inkstands to the large and imposing hall stands already mentioned. A number of eminent artists and designers worked for the company including the sculptor John Bell whose Coalbrookdale iron *Andromeda* was shown by the firm at the Great Exhibition in 1851. Critics commented on this exhibit favourably saying "as an example of casting it may

take rank with the best specimens in the Exhibition.” Bell also designed the *Deerhound* hall table, a commissioned piece where the deerhounds, which provide the four supports for the table top, bear on their chests the arms granted to John Hargreaves of Blackburn, Lancashire. This elaborate and imposing item, clearly demonstrating the firm’s capability, was shown at the Paris International Exhibition in 1855. Christopher Dresser also worked for the Coalbrookdale company and a number of designs for hall stands, hall chairs and garden benches can be attributed to him. A pioneer of industrial design, Dresser was well aware of the considerable potential embodied in cast iron as an ideal material for the manufacture of furniture.

As a substance cast iron had many advantages which made it suitable for the manufacture of furniture. As an alloy of iron and other materials, its crystalline structure enabled it to be poured into moulds when in molten form. The process by which castings could be produced was, and still is, relatively simple, involving sand moulds and carved wooden templates. Simple objects such as solid and pierced decorative panels could be produced straightforwardly in two-part moulds, though more complex objects might involve three-part moulds or even a lost-wax process. It will perhaps be obvious that the great virtue of cast iron lay in the fact that it could be moulded to take on almost any form. The tractability of cast iron and the simple technology needed to produce three-dimensional objects meant that decorative items of almost any form could be produced to identical standards, repetitively and at an economic cost. The early 19th-century preoccupation with bringing the garden into the home and the cult of naturalism, which was to reach its zenith during the High Victorian period, provided the foundry industry with the stimulus to produce goods which would satisfy the demand for garden, conservatory and hall furniture. The writer J.C. Loudon in his *Encyclopaedia of Cottage, Farm and Villa Architecture* (1833) recommended the use of cast-iron furniture for halls on the grounds that it was cheap and practical, and illustrated examples of hall chairs in various styles. The majority of the furniture items were made from prefabricated panels which could be bolted together to produce the desired object.

In stylistic terms the items conformed to the Victorian taste for heavy ornamentation, and in this respect the medium responded well to the reproduction in cast iron of naturalistic, Gothic, Renaissance and Neo-Classical repertoires of ornament. It had the added advantage of being able to be finished in a variety of ways and painted finishes and bronzed metallic effects were not uncommon. Indeed in certain cases the user might not even know the object was made from cast iron at all, as the finishing process could hide the nature of the core material. Garden benches and conservatory benches, one of the commonest types of cast-iron furniture, were usually made from three panel components, two for the sides and one for the back, the seats more often than not being made from wooden slats. The panels often took the form of logs, with branches and twigs smothered in foliage – this was considered to be a very appropriate form of decoration given the object’s likely location. Hall stands on the other hand were often made from panels where the ornamental detail was more formal or even abstract in nature. In both cases, however, the objects were

functional, decorative, sturdy and were easily capable of withstanding wet environments and heavy usage.

While the products of some of the foundries which displayed items at the Victorian exhibitions held in Europe and America received critical acclaim and the firms were awarded medals for their efforts, many design critics poured scorn on the cast-iron furniture produced in the mid part of the century. A.W.N. Pugin criticised the excesses of ornament found on many cast-iron objects in the 1830s and as late as 1868 Charles Eastlake wrote “all cast iron ornament is bad in style”. Although tractability had been one of cast-iron’s fundamental assets in terms of its application to the production of a wide range of objects, it was this very property which eventually led to the resultant objects being so heavily criticised. With hindsight this criticism seems unfair. In many respects it was an admirable industrial material with a potential that was fully exploited by foundry entrepreneurs. Certainly if sales and usage are anything to go by, decorative cast-iron furniture was popular with a wide range of consumers.

Many companies protected their designs by registering them with the patent office, and surviving examples often bear the diamond registration marks used to mark items between 1842 and 1883. The simple code embodied in the diamond gives information related to the day, month and year of registration. After 1883 the marks “Rd. No.” (registered number) followed by a series of digits may be found. Both of these sources of information are useful when research is being carried out on an item today. Some companies marked objects with their own cypher or mark and this is indeed true of Coalbrookdale products where a small rectangle on the underside of an object will reveal the name.

One category of furniture incorporating cast-iron components is 19th-century patent furniture. The first patent for a metal bed was taken out in 1849 and the major bedhead components were made from cast iron. But, in the late 1850s, when steel tubing became available, cast-iron bedsteads were superseded by tubular steel ones. More successful, however, was the range of tables designed for specific purposes. Carter’s patent Literary Machine, sold by J. Carter of 64 New Cavendish Street, Portland Place, London provides a good example of such a table. It consisted of a small round circular table top made of mahogany, supported by a tubular metal stem and with a moulded cast-iron cruciform base. From beneath one side of the top an arm projected which supported an adjustable surface which acted as a book rest. Many of these industrially-made novelty objects combined technical ingenuity with modern materials and the use of cast-iron components for structural support and decorative ornamental detail represented an interesting and valid use of the material.

The demand for cast-iron furniture had fallen by the end of the century as fashions changed, and this is reflected in the reduced number of designs shown in the foundry trade catalogues. It is only in recent years that cast-iron furniture has made a comeback as interest in the Victorian period has grown and conservatories have once again become popular features of late 20th century homes. Many of the cast-iron seats and tables made today are reproductions of designs first introduced in the 19th century.

Selected Manufacturers

Manufacturers involved in the production of Cast-Iron furnishings included the following: William Bullock and Co., West Bromwich; the Coalbrookdale Company, Shropshire; the Carron Ironworks, Falkirk; Walter Macfarlane and Co., Glasgow; and The James Foundry Co., Staffordshire. American producers included the Miller Iron Co., Providence, Rhode Island; J. L. Mott Ironworks, New York and Chicago; and Robert Wood and Co., Philadelphia.

Selected Collections

Specialist collections of British Cast-Iron furniture can be seen at the Falkirk Museum, Falkirk, Stirlingshire, the Victoria and Albert Museum, London, and the Coalbrookdale Museum of Iron, Telford, Shropshire.

Celtic Revival

The Celtic Revival had a particular vogue during the last two decades of the 19th century and the period leading up to World War I in the 20th. At its zenith, Grant Allen in the *Fortnightly Review* of 1893 could claim that it was the Celtic spirit that lay behind most innovations in Western culture, fixing on examples as diverse as Socialism, Methodism and the Eisteddfod. Like most of the ideological movements of the period, it embraced all aspects of culture, and although its most successful form was in literature, particularly that of Yeats and the Irish literary revival, it was also evident in many interiors and furnishings of the period. In discussing early 20th century styles, *The Lady's Realm* of 1905 (vol XVIII, p.228) commented that "fumed oak and inlays of ebony and ivory point to a Celtic origin, and many town houses are furnished throughout on this scheme of decoration."

There had been considerable interest in the Celtic peoples among antiquarians of the 18th century, but the intellectual origins of the Celtic Revival proper may be traced to research and debate in philology, archaeology and racial theory during the second half of the 19th century. It was from writers like Ernest Renan and Thomas Carlyle that a notion of Pan-Celtic identity and culture was established. Celticism appeared as an

expression of the marginal or peripheral cultures at the north-western extremity of Europe, where the Celtic peoples had been driven in the early Middle Ages by successive invasions. Racially and culturally, Scotland, Ireland, Wales, the Isle of Man, Cornwall and Brittany were felt to have a common ancestry distinct from the rest of Britain and France. Such speculations and new scientific discoveries surfaced in the later 19th century among the national and religious disputes in the countries of the so-called Celtic fringe. In this respect the Celtic Revival could be described as a manifestation of National Romanticism which thrived during the same period in central Europe and Scandinavia. Celticism was viewed as a tribal phenomenon with a great literary and musical tradition; it was argued that the oral culture emanating from this Celtic Spirit had been overwhelmed and marginalised by the onset of industrialisation and urban growth, although it had managed to prevail in traditional rituals, crafts and festivals.

One of the principal aids to the Celtic Revival in the visual arts was the archaeological discoveries of the mid to late 19th century and the presentation of important finds in publications and museum displays. The Tara Brooch and the Ardagh Chalice, for example, discovered in Ireland in 1850 and 1868 respectively, were copied by several metalworkers (notably Waterhouse and Co. of Dublin and, slightly later, Edmond Johnson), the designs eventually being used on objects as diverse as dishes, tea sets and the paraphernalia of the gentleman's desk. It was the publication of Celtic decoration, however, particularly those patterns from manuscript illumination, which created a repertoire of designs that could be applied to a range of media and contexts. Among the decorative arts featured in "artistic" interiors of the period, Celtic designs were particularly popular for metalwork, stained glass, stencilwork, textiles and carving. A further boost to the Revival was the appearance of such crafts in International Exhibitions of the period, particularly those in America where cities such as Chicago, host to the World's Columbian Exposition of 1893, had a large Irish population.

Given the emerging consciousness of Irish identity, it is not surprising that Celtic designs should have been prominent in works produced under the aegis of the various Arts and Crafts associations in Ireland. The Dun Emer Guild, for example, set up in 1902 by Evelyn Gleeson and the two Yeats sisters, Lily and Elizabeth ("Lolly") took its name from "Emer", the wife of the ancient Celtic hero Cu Chulainn. Much of the imagery used in their textiles, carpets and book illustration was derived from the traditional Celtic vocabulary of interlace patterns and stylised dragons. The most celebrated craftsman of the Irish Arts and Crafts Movement was Harry Clarke, a stained glass artist and book illustrator, whose work was influenced by Celtic patterns while also being heavily dependent on the febrile stylizations of Aubrey Beardsley and the late Symbolists. Alongside the craftworkers of the Dun Emer Guild he was employed on several collaborative schemes such as the Honan Chapel in Cork in which the unifying element was the protean Celtic interlace pattern, found on glass, stone, metal and textile.

Working from the Isle of Man between 1889 and 1901, H.M. Baillie Scott developed an integrated style of interior decoration, inspired largely by William Morris but exploiting a richer sense of an ancient tribal past that was redolent of

popular ideas of the Celt. This style gained great international prestige when Baillie Scott's designs for the Palace at Darmstadt were published in *The Studio* in 1898. In 1901 Scott won the top prize in the competition for a house for an Art Lover, with a design based on similar principles, although very little of it was explicitly "Celtic". The designer who did most to bring the styles and motifs of the Celtic Revival into the mainstream was Baillie Scott's Manx collaborator, Archibald Knox (1864–1933). Between 1899 and 1912 Knox designed two lines for Liberty's, Cymric and Tudric ware, which exploited the elaborate interlace pattern of Celtic ornament. Initially applied to plate and candlesticks, the designs which Liberty's promoted as "suggestive of a more remote era than this", were soon to be found on picture frames, wall mirrors, clocks, cigarette cases, belt buckles and jewellery. Such was the popularity of the two-dimensional Celtic interlace that it was also applied to the firm's carpets, textiles and ceramics.

The association of Celtic culture with Ireland and hence Catholicism, could explain why evidence of the Celtic Revival, with its range of suitably sinuous forms, was not more pronounced in the Glasgow Style interiors of Charles Rennie Mackintosh and his associates. Although Glasgow had a large Catholic community, it was largely composed of recent immigrant Irish or Highland workers who lacked the wealth and political clout to impinge on the world of the International New Art. In Edinburgh, on the other hand, Catholicism was not so socially problematic and it was here that Celticism found its most vociferous and active exponent, the maverick Patrick Geddes (1854–1932). The periodical *The Evergreen*, one of the numerous illustrated art magazines of the 1890s, was a mouthpiece for Geddes and the artists and designers sympathetic to Celticism. Among the latter was Phoebe Traquair who provided a direct link with the Irish Arts and Crafts Movement, having trained in Dublin.

What distinguished Geddes from his Irish counterparts was his commitment to large-scale mural schemes to put over his aesthetic and cultural ideals. There are, however, very few documented or surviving Celtic interior schemes by this group, a notable exception being Ramsay Garden in Edinburgh (1893–95) undertaken by a number of craftworkers under the direction of Geddes and the artist John Duncan. As well as private flats which made up the bulk of this development, the self-governing student hostel incorporated a large common room decorated with extensive Celtic knotwork and a series of twelve murals on the spiritual history of the Gael, which in Geddes's view extended to the Arthurian cycle and to modern figures like Charles Darwin.

A recurring theme in the writings of the Celtic Revival was the emphasis on the separate development and character of the early Celtic church. Given the national and political context in the wake of Catholic Emancipation, therefore, it is not surprising that the more important decorative schemes should have been applied to ecclesiastical interiors, in Ireland notably St Brendan's Cathedral (Loughrea, c.1902–20), and the Honan Hostel Chapel (Cork, c.1916). Equivalent examples in Scotland would be the Catholic Apostolic Church decorated with murals by Phoebe Traquair (Edinburgh, 1895–97), and St. Conan's Kirk (Argyll, 1907–30).

Irish Home Rule in 1921 confirmed the popularity of the Celtic Revival as a national style based on true sources. Not

surprisingly therefore, Celtic-inspired decoration has persisted in Ireland throughout much of the present century and it is still possible to see new decorative schemes in public and private buildings which deploy Celtic motifs alongside other symbols as the expression of an independent, native Irish culture.

Chairs

In its widest sense the chair holds a special position in the interior as it is the only item designed to support people. It is not a coincidence that the parts of a chair often has human attributes, for instance, arms, legs, feet, back, and seat. The variety of chairs that has developed over 4000 years of furniture use testifies to the importance of this furniture type. Chairs ranging from simple stools to elaborate thrones represent aspects of social history, the most common being the indicator of status.

The range of chairs appears to be endless. Apart from those indicating position or status, there are others intended for a wide variety of special purposes. These include dining, sleeping, rocking, relaxing, praying, reclining, exercising, and sewing. In addition, the selection is further extended by methods of construction including fixed, folding, wheeled, and skidded. Also the choice of materials in chair-making has ranged from marble to plywood, and from coal to glass.

In Egypt, seats were derived from backless stools, initially having framed seats with carved bulls' legs to the front, and then to armchairs by the 4th dynasty (c.2600–2500 BC). The best-known example of an Egyptian seat is Tutankhamun's gold throne, both as a model of furniture-making and also as the embodiment of the symbolic authority of the chair. On a more mundane level, stools remained popular, often designed with braced struts and a white paint finish. Folding stools were also used: they often had hide seats, and cross-frames decorated as carved ducks' heads inlaid with ivory.

In ancient Greece, seating arrangements were based on a range of stools and chair types. Stools were basic four-legged versions or box-like constructions. In addition there was the

Chairs: designs for chairs by the firm Poirer et Remon, Paris, late 19th century

diphros, a four-legged stool with stretchers. The famous *klismos* chair form, originally with well-proportioned outward-curving legs and a back panel at shoulder height, gradually developed a top-heavy back board, thus making it rather clumsy in appearance. The Romans developed the *curule-sella curulis* – a seat with arms and no back. This was an important precursor of the folding chair or *faldstuhl* and the X-chair.

In the Byzantine period chairs and thrones remained important and were now based on a box shape with back. X-framed chairs, sometimes made of metal, were fitted with a slung leather seat. Combinations of desk and lectern were significant, indicating the importance of manuscripts and reading.

Chairs remained a sign of rank and the style of chair reflected its occupant's position within society. The throne of the Emperor Maximian which was covered with carved ivory plates indicates this status. Thrones were the ultimate symbols of authority: examples include the English Coronation chair, Dagobert's bronze throne, and the silver throne of King Martin of Aragon.

During the Middle Ages, chairs developed in England, France and the Netherlands, based on a box-like panelled structure, possibly derived from chest construction. Chair types, including simple turned chairs with pegged members and box-seated chairs, were decorated with carving, applied mouldings and arcading. In conjunction with these patterns the X-framed chair remained a favoured model.

Chairs developed from a box-panelled shape gradually began to be less heavy, more open, and usually fitted with arms. They were given a slight rake to the back, but the legs remained straight. Joiners continued to make chairs, often adorning them with prestigious ornament inlaid into the backs of such "joyned" chairs.

The chair developed a greater number of variations in the 16th century. The *caquetoire* was a French-style chair designed for conversation, while the farthingale chair developed in England and Europe. The name farthingale is a modern description for a broad seated side chair or back stool introduced in the latter part of century and common for the next 100 years throughout Europe. It was used for casual seating and dining and for the latter purpose would be covered in leather.

During the 17th century chair types continued to proliferate. Regional variations became important with such examples as the Yorkshire and Derbyshire chairs. These were identified by a variety of arcaded backs and particular turnings. In America the regional types included the Boston chair, a leather-seated chair with a broad central splat, while the Brewster chair from New England was a spindle-backed rush-seated chair with high posts and decorative finials. Though known as early as the 15th century, the chair-table was not popular until the 17th century. It was a wooden armchair with a large hinged back which could be let down for use as a table. The settle was sometimes further developed into a combination piece, with the back turning into a table (called a monk's bench). The thrown chair with highly turned parts was an example of the turner being employed to make chairs in this period.

Chairs continued to be made in massive and solid forms, but there was a growing demand for comfort and luxury. The result of this was the beginning of upholstery, the earliest

examples being simply based on stretched coverings over a frame. This developed into the X-frame chair which was supplied with loose cushions. By the Restoration, twist turning had become a typical feature of the period, and the tall-backed walnut chairs with caned seats and back panels were easily recognisable. Constructionally they were not always so sound, since in many cases, seat-rails were simply placed on top of the legs and dowelled instead of being tenoned in between. However, the introduction of the splayed back leg does show some consideration for the possibility of over-balancing. The double-scroll Flemish leg changed to a Dutch bandy-leg which gradually led to the cabriole shape. By the 1690s an inverted cup and trumpet was used for legs on tables, tallboys and cabinets. Castors, using leather or wood rollers were introduced around this time. Daybeds or couches, with six legs, had cane, carved or turned-wood decoration to match the chairs. Settee-backs were divided to give the effect of chairs joined together, and for dining chairs, drop-in seats and the stuff-over method were both used.

Queen Anne chairs were noticeably restrained in their added decoration, although the most important feature to emerge from this period was, without doubt, the cabriole leg. Introduced in the late 17th century, and perfected at the beginning of the 18th, the cabriole leg, with its uniting of two opposing curves, was seen as the epitome of the curvilinear design. Compound curves were introduced into the hoop backs of chairs, and stretcher braces disappeared as construction techniques improved.

Chair types continued to increase. Hall chairs with hard seats, often decorated with coats of arms, became important. The *sgabello* chair, derived from Italian originals, and often fitted with a shell-shaped back was also used for halls and entrances. Upholstered easy chairs with embroidered coverings, and upholstered wing-chairs with padded arms and backs demonstrated a renewed desire for bodily comfort as well as the avoidance of cold draughts.

The vernacular types continued to develop, especially with the Windsor chair. This traditional chair form made with a solid wood seat and stick back was known in England and America from the early 18th century and has continued as a type-form ever since. The regional variations are wide and give credence to the idea of a lively local design tradition. Indeed, in the second half of the 20th century the Windsor chair has been used in traditional and contemporary interiors.

Around 1700, Daniel Marot introduced a style of chair with a narrow back which enclosed a vertical solid vase or splat, and is sometimes known as a Queen Anne chair. The introduction of cabriole legs changed chair construction by removing the stretcher bars. The construction method demanded a wider knee which soon became a favourite place for carved decoration. Other technical changes occurred: shoe-pieces for backs were now pinned and glued to back rails, and seat rails were rebated to accept drop-in seats. Chairs had broader seats and the cabriole legs were finished in a ball and claw foot.

During George II's reign, legs became even more elaborate having high relief carving and decorated seat rails with solid splats replacing pierced ones. These features remained essentially the ingredients of wooden armchairs throughout the mid-century. There were innovations and changes of scale and detail in line with changes in taste. An example was the intro-

duction of the square-section leg with stretcher bars; the ladder-back dining chair; fretted and latticed work in the Chinese style, and various Gothic motifs.

Numerous designers have been credited with particular chair styles. Robert Adam's French influence is apparent in his chair designs based on the oval back and taper-turned leg, whereas the Neo-Classical influence was found in the round, or rectilinear style of backs.

Hepplewhite introduced the shield-back, oval, and heart shapes for chair backs which are often supported by the upward elongation of the back legs. Thomas Sheraton's chairs were generally designed with square backs and frequently had square-section legs which were slightly tapered. For economy or a particular effect many of these chair types were often made from beech with a painted finish.

Throughout the 18th century the range of chair types continued to develop. Many of these were again special-purpose models. The gouty chairs for example, were designed to allow invalids to self-propel the chair around a room, while library chairs were especially designed for supporting a book and assisting the reader. Upholstered armchairs referred to by Ince and Mayhew as burjairs (bergères) were popular, as they allowed for informal relaxation. Sheraton stipulated that they should have caned back and arm frames and loose cushions; this style was popularly revived in the early and mid 20th century.

The development of fancy chairs began in the late 18th century, when a taste arose for the lightweight but decorative chair. Sheraton encouraged the style, while in America, Hitchcock introduced a late Sheraton-style chair of light weight having a cane or rush seat, often painted in black with gold or stencilled decoration, which was very successful.

Regency chairs can be identified by their dark, glossy wood offset by brass inlay, trellis-work galleries, lion's paw feet, masks, star-shaped bolt heads and studs. Angularity of shapes was often accentuated by reeding on chair legs and cabinets as it was considered that ancient furniture was nearly always angular. The chairs often took on extravagant proportions or highly decorated forms to make them appear lavish in conception and execution. Motifs such as dolphins and chimera, as well as more restrained images derived from classical devices, were common.

Victorian chairs were characterised by the revivals that formed the styles of interiors, including the Gothic, the Elizabethan, and the Rococo, but from the 1850s onwards, upholstered lounge suites of no particular pedigree were popular. These comprised a sofa, a pair of spoon-back chairs and a number of smaller balloon-back side or dining chairs. These suites remained available well into the next century in one form or another and were a middle-class status indicator. During the period 1850–1900, two new chair designs were introduced that are seen as typically Victorian. These were the balloon-backed dining or bedroom chair and the *prie-dieu* or kneeling chair.

Nineteenth-century chairs display Janus-like features. On the one hand they were often based on revivals of past styles. The *Glastonbury* chair for example, was a 19th-century term for a type of chair based on a 16th century model supposedly based on a model made for the Abbot of Glastonbury. On the other hand they often incorporated interesting and new tech-

nology which was hidden within the chair. The use of metal springs was a very important step in the search for resilience and comfort, while the easy chair, with an internal frame of iron strips often in combination with springing, created a comfortable and relaxing chair.

In the same vein were a wide range of reclining chairs, often based on patent methods, which varied from medical principles to sumptuous elegance. Rocking chairs also developed in this period, usually with an emphasis on a combination of comfort and technology. Rockers were made in wood or metal; they were mounted on curved skids or on spring platforms and achieved great success in Europe and the United States. Patentees also devised new methods of construction, including the important knock-down technique, especially advantageous in the export business.

Arts and Crafts designers frequently returned to vernacular models for their chair designs. The Morris *Sussex* chair is one example, and the ladderback chair with horizontal rails, which was originally associated with country chairs, was taken up as the epitome of a simple chair. William Morris's armchair, with cushioned back and seat, and an adjustable rake to the back, was the precursor to many variations produced ever since. Particularly popular in the United States they were called Morris chairs for many years. The Arts and Crafts influence was also important for reconsidering the idea of the total interior. In terms of chairs this meant that architects were involved in designing chairs to complement interior schemes. The work of Gustav Stickley and Frank Lloyd Wright in America and C.F.A. Voysey in England clearly demonstrate this tendency.

One of the most important examples of change in chair design and making were the products and production methods of the Thonet company. Their laminated and later the bent-wood products have become internationally known as examples of simple, elegant and cheap chairs. The conscious decision to manufacture in bulk, to export worldwide, to use machinery and semi-skilled labour, and to produce designs that have since been seen as type-forms of chairs was revolutionary. Although the range of Thonet products was very wide, the classic *No. 14* chair remains an icon for designers today. It has been associated with the International Style of the 1920s to 1930s, has experienced a revival in the 1960s and 1970s in eclectic interiors supplied by Habitat and their like, and in the 1990s the models are still used as a basis for simple chairs, even if made from metal or plastic.

During the 20th century the chair has become an icon of style and design movements. Many architects have designed chairs, often as a complement to their architecture and interior work; very often these designs coexisted, bearing little relation to the commercial styles available to the majority. This is partly because much of an architect's time is involved in contract work rather than domestic design. Examples of individual designers will be found in other parts of this book, but mention must be made here of some of the most important. Some experimented with new artistic ideas, others developed new materials and design approaches, yet others returned to the essence of craft to develop their designs.

One of the major features of 20th-century furniture design, particularly of chairs, is the understanding that furniture items stand in a given space and, in the case of chairs, often remain unoccupied for much of their life. Their sculptural value in an

Chairs by Arne Jacobsen, the *Egg* and the *Swan* for Fritz Hansen, late 1950s

interior is therefore quite important. Designers as varied as Charles Rennie Mackintosh, Gerrit Rietveld and Harry Bertoia all acknowledged in different ways this role for a chair. Mackintosh used the chair in a way similar to early Frank Lloyd Wright chairs, to enclose a dining space, for example. Rietveld and his famous *Red / Blue* chair used his design to evaluate grids and planes in relationship to each other and beyond that within the space in which the chair stands. In 1952 Harry Bertoia, who trained as a sculptor, devised the wire chairs which have since carried his name. These particular chairs clearly show an understanding of the needs of the open-plan interiors of that time and remain elegant examples of the sculptural possibilities of chairs.

The second strand in 20th-century chair design was the application of materials towards a Modernist ethic. In the Bauhaus the seminal work of Marcel Breuer was an enormous challenge to convention and resulted in the famous *Wassily* chair and the ground-breaking cantilever chair. From the same inspiration were the chairs of the architect Mies van der Rohe. His *Barcelona* chair from 1929 is often seen as a “design classic” which epitomises the tenets of Modernism in its purity of form, lack of applied decoration and fine materials.

Many other early 20th century architects devised furniture for their interiors, often in collaboration with a partner. Le Corbusier and Charlotte Perriand are one such team, as were Charles and Ray Eames. Among many experiments using a variety of materials, their work on plywood chair frames is very significant. The resulting three-dimensional plywood chair seats and backs were revolutionary.

Plywood and laminated wood were also the favoured materials of the Finnish architect Alvar Aalto. His experiments with cantilever forms made in beech and birch were in contrast to

the metal forms of the Bauhaus and the main Modernist movement.

After World War II, other materials began to feature in chair design. Aluminium was successfully used by Ernest Race in his *BA* chairs but was not destined to be a widely favoured material. More successful in the long term was the role of plastics. Often associated with the Pop movement and the 1960s, plastic chairs have been developed in an enormous variety of styles and forms. On the one hand the potential of plastics has been explored in injection-moulded units such as Robin Day's polypropylene chair and some Italian studio designs, while on the other hand, many commercial manufacturers have used fibreglass or polystyrene shells for a range of chairs for the mass market.

The benefits accruing from other technology, such as plastic foams, have also influenced the design of chairs. Some “chairs” have been created to exploit the material into a variety of sculptural shapes, while others have used the material to reproduce traditional style upholstery at a mass market level.

A third strand of chair design in the 20th century is the importance of craft and material. The work of Carlo Bugatti, Jacques-Emile Ruhlmann, Maurice Dufren , and Pierre Chareau all emphasise the chair as a vehicle for exotic decoration, fabric or special effect. In another vein is the more influential role of Scandinavian chair-makers in the post-war period. Designers such as Hans Wegner, Arne Jacobsen, and Bruno Mathsson have produced enduring chairs which have combined hand skills and machine work, as well as reflecting a simple attitude to materials and decoration.

Other examples of this craft work are Wendell Castle (USA) and John Makepeace (UK). Both are interested in the effects that can be achieved by materials, but both have also looked at

added decoration and have moved towards a Postmodern ethic.

In the Postmodern era of the 1980s and 1990s, chairs again became icons of style. Whether it is Memphis with a riot of colour and pattern, Philippe Starck and a playful approach to chair design, Tom Dixon making chairs from found objects, or Ron Arad's unconventional use of materials, the chair will continue to be a challenge for future generations of designers.

Chambers, William 1723–1796

British architect, designer and theorist

Sir William Chambers was regarded as the most successful architect of the second half of the 18th century; he was also the most travelled and mixed freely with the more progressive Continental architects and theorists on his numerous trips abroad. Yet today he is frequently viewed as an establishment figure and, in comparison with that of his more fashionable contemporary, Robert Adam, his work is often deemed to have been quite conservative. An able administrator, he is also remembered as a key figure in the Office of Works and as a founder-member and first treasurer of the Royal Academy of Arts. He was the author of numerous books on architecture and design including *A Treatise on Civil Architecture* (1759) which was the most widely read of all 18th-century academic treatises, and he did more than anyone else prior to Sir John Soane to bring new dignity and prestige to the architectural profession in Britain.

Born the son of a Scottish merchant, Chambers spent much of his childhood in Gothenburg, Sweden. Destined for a mercantile career, he worked for the Swedish East India Company from 1739 to 1749, during which period he made a number of trips to China. This rare first-hand experience of the inhabitants and topography of China made him something of a celebrity in Sweden and London. The lengthy sea voyages also gave him the opportunity to study mathematics and languages, and, more importantly, books on architecture.

In 1749, at the age of 26 and with modest savings from his years in business, Chambers embarked upon an architectural career. He enrolled at Jacques-François Blondel's Ecole des Arts in Paris where he made contact with many figures who played an important role in development of Franco-Italian Neo-Classicism. Between 1750 and 1755 he was in Rome almost continuously where he was taught by the French Neo-Classical Charles-Louis Clérissieu and where he met many of the more progressive artists, theorists – including G. B. Piranesi – and patrons of the day.

He returned to London in 1755 to launch his career. However, despite a thorough grounding in the most sophisticated Continental ideas, professional success was not immediately forthcoming. The publication of *Designs of Chinese Buildings, Furniture, Dresses, etc.* in 1757, produced in part to “put a stop to the extravagances that daily appear under the name Chinese”, enjoyed only limited success in England, although its influence was much more substantial abroad. French editions appeared in 1757 and 1776 where it encouraged the continuing popularity of Chinoiserie, and German editions were published in the 1770s and 1780s. The book was “rediscovered” in Britain in the early 19th century when the interiors of the Prince of Wales' Brighton Pavilion encouraged a renewed interest in Oriental and Chinoiserie styles of design.

Chambers produced several designs for Chinoiserie garden buildings and interiors in the 1760s and 1770s, but it was as a designer in the classical idiom that he was most significant. His

Chambers: design for entrance hall of Gower House, Whitehall, 1765-74

earliest designs, such as the unexecuted monument for the Prince of Wales (1751–52), were, by English standards, cosmopolitan and sophisticated. Another design, for Harewood House (1756), also shows the influence of his French training. But the rejection of this design in favour of a tamer and more conservative Palladian scheme executed by John Carr probably discouraged Chambers from further essays in this style and for much of the remainder of his career he too adopted the current Palladian repertoire, enlivened only occasionally by a sparing use of French details. While a knowledge of contemporary Parisian interiors is evident in Chambers's design for the Gallery at Kew (1757), he developed a personal but distinctively English style for the design and decoration of his subsequent classical buildings.

In comparison with the work of the Adam brothers, Chambers used decoration sparingly, especially on walls. These were sometimes left plain, as in Dundas House, Edinburgh (1771–74), or were articulated with panels formed by thin mouldings. The walls of entrance halls might include niches with sculptural figures. Occasionally, as in Gower House, London (1765–74), he might use Adamesque motifs, but Chambers always left plenty of blank space between the decorated areas. Ceilings, by contrast, were much richer. Early examples, such as Roehampton, Surrey (c.1761) continue the essentially Palladian tradition of using robust mouldings to divide the ceiling into a series of compartments; the compartments themselves contained a series of relatively heavy Palladian or Neo-Classical motifs. For taller spaces he often specified a deep cove. In later examples, the decoration is more delicate and, although Chambers continued to exercise a fondness for geometric compartments, the motifs within are more refined. The gallery at Milton Park (1770–76), has an almost Rococo lightness, while in other interiors, such as those at Somerset House, Chambers develops a more masculine version of the Adam repertoire.

Chambers's role in developing the scope or extent of the architect's involvement in interior design was also significant. Whereas previously architects's drawings had usually been produced in monochrome or had depicted a single room in isolation, Chambers produced a series of coloured sectional drawings which illustrated decorative schemes for the complete building. These drawings were produced either by his own hand, or by his pupils and assistants, and one of the earliest examples is the unexecuted design for York House, London (1759) which shows details such as chimneypieces and mouldings and rooms hung with a variety of coloured, patterned silks or wallpaper. Numerous references to colour schemes also occur in drawings or correspondence related to executed commissions.

Chambers also designed furniture for some of his buildings such as Charlemont House, Dublin (1763–75) and Blenheim Palace where he carried out alterations between c.1766 and c.1775. More often he designed chimneypieces, for example at The Hoo, Hertfordshire (c.1762) and Peper Harrow, Surrey (c.1765–75). But a letter to Lord Melbourne of 1773 suggests that Chambers took a close personal interest in the way in which his buildings were furnished. He writes: "Chippendale called upon me yesterday with some Designs for furnishing the rooms which upon the whole seem very well but I wish to be a little consulted about these as I am really a very pretty connois-

seur in furniture ...". It is likely that Chambers acted as a consultant, overseeing the furnishing and decoration of a number of his houses.

Chambers's *Treatise on Civil Architecture* was described by Horace Walpole as the "most sensible book and the most exempt from prejudice that ever was written on that science". It was certainly one of the most widely read, with further editions appearing in 1768 and 1791, when the text was amended and the book was renamed *A Treatise on the Decorative Part of Civil Architecture*; additional versions were published after his death in 1825, 1826, 1836 and 1862. The bulk of the text was concerned with the exteriors of buildings, but much was also relevant to the decorative use of orders within interiors and it contains sections of chimneypieces, ceilings, and drawings illustrating the proportions of rooms. Nevertheless, there were comparatively few illustrations and it was essentially a theoretical treatise rather than a pattern book supplying specific models that could be imitated. Its influence on interior design was necessarily, therefore, limited, and ironically it was his illustrations of Chinoiserie, rather than classical designs that proved most significant within this context.

CHRISTOPHER WEBSTER

Biography

Born in Gothenburg, Sweden, 23 February 1723, the son of a Scottish merchant. Educated in England; returned to Sweden to join the Swedish East India Company, 1739. Made three voyages to the Far East: to Bengal, 1740–42; to Canton, 1743–45; and to China, 1748–49. Embarked on career as an architect; studied at Jacques-François Blondel's Ecole des Arts, Paris, 1749; travelled to Italy and studied in Rome with Charles-Louis Clérissieu, 1750–55. Married Catherine More in Rome, 1753; at least one daughter. Established architectural practice in England, 1755. Appointed architectural tutor to the Prince of Wales (later George III); joint architect (with Robert Adam) at the Office of Works, 1761; Comptroller of Works, 1769; Surveyor General and Comptroller, 1782. Published several books on architecture, gardens and design. Member, Swedish Academy of Sciences, 1766; Knight of the Polar Star, Sweden, 1770; subsequently allowed to assume title of British knight; Fellow, Royal Society, 1776. Regular exhibitor, Society of Arts, London, 1761–68; founder-member and treasurer, Royal Academy of Arts, London, from 1769. Died in London, 8 March 1796; buried in Westminster Abbey.

Selected Works

A complete catalogue of Chambers's architectural and decorative work appears in Harris 1970. Important collections of designs and drawings are held in the drawings collection of the Royal Institute of British Architects; Sir John Soane's Museum, London; the Victoria and Albert Museum; and the Royal Library, Windsor; and also in the Avery Library, Columbia University, and the Metropolitan Museum of Art, New York. A large number of Chambers's letters are in the Manuscripts Collection, Royal Institute of British Architects; four letter-books, containing copies of professional correspondence dated 1769–75, are in the British Museum.

Interiors

- 1757–c.63 Kew Gardens, Surrey (garden buildings with some interiors): Princess Augusta and George III
- 1758–76 Casino, Marino House, near Dublin, Ireland (building and interiors)
- 1760–64 The Hoo, Kimpton, Hertfordshire (interior alterations, bridge and gateway)

- 1762–76 Buckingham Palace (formerly Buckingham House), London (remodelling, additions and interiors including the saloon and the Octagon library): George III
- 1763–75 Charlemont House, Dublin (building and interiors including furniture): 1st Earl of Charlemont
- 1764–70 13–22 Berners Street, London (town houses, interiors and decoration of no. 13): William Chambers
- c.1765–75 Peper Harrow, Surrey (alterations, additions, new villa and interiors): 3rd and 4th Viscounts Midleton
- 1765–74 Gower House, Whitehall, London (building and interiors including the hall, eating room, great drawing room and staircase): 2nd Earl of Gower
- 1766–75 Blenheim Palace, Oxfordshire (garden buildings, and internal decorations including the grand cabinet, state bedchamber and Duchess's dressing room): 4th Duke of Marlborough
- 1767–72 Woburn Abbey, Bedfordshire (rebuilding of the South Wing and interiors including the eating rooms and library): 4th Duke of Bedford
- 1768–72 Amptill Park, Bedfordshire (additions and redecoration of principal rooms): 2nd Earl of Upper Ossory
- 1771–76 Milton Park, near Peterborough, Northamptonshire (alterations and interiors including the gallery, dining room, tea room and green library): 4th Earl of Fitzwilliam
- 1776–82 Somerset House, Strand, London (building and plan, completed by James Wyatt): Office of Works

Chareau, Pierre 1883–1950

French architect and designer

The architect and furniture designer Pierre Chareau made a significant contribution to Modernism in France in the period between the two world wars. Today, his reputation rests largely on the design of one house, the Maison de Verre, which was completed in 1932.

Born in Bordeaux in 1883, the young Chareau was employed as a draughtsman in the Paris office of the English furniture manufacturers, Waring and Gillow, from the age of 16. Waring and Gillow's furniture was craftsmanlike and well-made and Chareau remained with the firm for a total of ten years, learning his trade.

On returning from military service in 1919 he established his own practice in Paris as an architect and furniture designer. His early chairs had massive wooden seats with dramatic grainy veneers, but within a couple of years his forms had become more assured. The Bergère chair of 1921 was also slightly Neo-Classical. By 1923 Chareau was exploring the idea of moving parts – sliding screens, drawers that rotated from a hinge at one corner, tables with leaves, and cots with dropping sides. This was an interest that remained with him all his life and that reached its climax in the Maison Verre.

In 1924 Chareau opened a shop called La Boutique in which to sell his furniture. He also began a long association with the metalworker Louis Dalbet during this year. Dalbet encouraged Chareau to experiment with metal frames, and the desks and tables from this period began to be supported by black steel flats. Chareau and Dalbet also produced a series of light fittings using flat sheets of alabaster and steel framing. Chareau's work was becoming more adventurous and he began to collaborate with avant-garde filmmakers and Modernist architects such as Bernard Bijvoet, Robert Mallet-Stevens and Francis Jourdain. Influenced by the Bauhaus, Chareau and Dalbet began to abandon flat metal framing in the late 1920s in favour of steel tubes.

Chareau obtained his first architectural commission in 1927 and he employed Bernard Bijvoet as his assistant. The commission was for a clubhouse at Beauvallon which was also furnished throughout with Chareau's designs. All trace of the traditional elements in his furniture had disappeared; the chairs were mostly framed in light steel, and the tables and fittings were hard-edged and aggressively rectangular.

The following year Chareau was commissioned to design a house for Dr. Dalsace whose wife was the niece of Chareau's Beauvallon client. Once again Chareau called in Bijvoet and Dalbet to work with him and together they produced the Maison de Verre (completed in 1931) which is Chareau's masterpiece and one of the great interiors of the 20th century.

The Dalsace's site in the rue Saint-Guillaume in Paris would have daunted most designers. It was located at the back of a courtyard which contained an 18th-century house. This had to be demolished to make way for the new building but the top two floors had to be retained because they belonged to a different owner who refused to move! Chareau inserted a frame of riveted steel and the two new external façades were made entirely of glass. The windows had clear glass and steel frames and the remainder of the building was enclosed by rectangular

glass bricks. The design accorded with Dr. Dalsace's belief that as much daylight as possible should enter the house.

The interior of the Maison Verre is "High-Tech" two generations before its time. It contains an exposed steel frame whose joints are revealed, studded white rubber floors, window opening devices celebrated as conspicuous pieces of machinery, staircases with elegant minimalist steel handrails and extensive use of bright primary colours.

The building is entered up a short flight of steps at the side of the courtyard. The entrance floor was reserved for Dr. Dalsace's medical practice and had free-flowing partitions weaving in and out of the free-standing exposed H-section steel columns. The plan is very deep, and full-height pivoting glass panels introduce additional light into the interior. A wide staircase leads into the magnificent double height living rooms on the first floor. The free-standing steel columns are painted bright red and all their rivets are revealed. The living room is furnished with Chareau's chairs and bookcases; display cases and cabinets show Dalbet's black metalwork to its best advantage. The family bedrooms are situated on a gallery; movable screens of perforated metal or glass and movable bookcases provide a layout that can be constantly changed and bedrooms can open up to become living rooms, bathroom or terrace as needed. Everything is extremely complex, although many of the swivelling partitions do not reach the floor or ceiling suggesting that privacy was not deemed a priority in the Dalsace family.

After the completion of the Maison de Verre, Chareau's architectural opportunities were limited. He designed interiors for the LTT Telephone and Telegraph company in 1931–32 but the effects of the Depression meant that there were few chances for large projects in Europe, and with the onset of war Chareau left France for the United States where he lived for the remainder of his life. His most significant commission in America was the house and studio that he designed for the painter Robert Motherwell in 1947. This was a typically spare and restrained design involving the conversion of a Long Island Quonset hut to which Chareau added a mezzanine and some nice wood detailing, but no more.

The influence of the Maison de Verre has been immense in recent years. Unlike Le Corbusier's villas, the Dalsace family continued to occupy the house for many years and a younger generation of architects and designers could view the house with all its original furnishings and decorations in place, looking very much as it had when Chareau first designed it. Among those who were particularly impressed were many young English architects of the 1970s and 1980s and it is tempting to see the Maison de Verre as the source of the ideas that were later developed in Piano and Rogers's Pompidou Centre, in Eva Jiricna's Joseph Shops, and in the work of James Stirling.

Biography

Born in Bordeaux, 3 August 1883. Studied painting, music and architecture at the Ecole des Beaux-Arts, Paris; apprenticed to, and then employed as a draughtsman and designer by Waring & Gillow Furnishings, Paris, 1899–1914. Married Dolly Dyte, 1904. Served in

French Army, 1914–19. Established his own design and architectural practice, Paris, 1919–40; opened shop La Boutique, selling furniture, 1924; worked with Bernard Bijvoet, 1925–35; emigrated to New York, 1940; practised in New York until 1950. Founder-member, Union des Artistes Modernes, and CIAM, 1929. Regular exhibitor at the Salon des Artistes Decorateurs, Paris, during the 1920s; exhibited at the Salon des Arts Décoratifs, Paris, 1925; Exposition Internationale, Paris, 1937. Died in New York in 1950.

Selected Works

Examples of Chareau's designs, and drawings for decoration are in the Musée des Arts Décoratifs, Paris and in the Museum of Modern Art, New York.

Interiors

- 1918–19 Apartment, rue Saint-Germain, Paris (furnishings and interiors): Dr. and Mrs. Dalsace
- 1924 Villa Hyères, France (furnishings): Vicomte and Vicomtesse de Noailles
- 1925 Exhibition, Salon des Arts Décoratifs, Paris (interiors and furniture for "Suite for an Ambassador" and "Dining Room for a Colonial Habitation")
- 1927 Golf Club, Beauvallon, France (building and interiors with Bernard Bijvoet): Emile Bernheim
- 1928 Grand Hôtel de Tours, Tours (interiors including smoking/games room and bar)
- 1928–32 Maison de Verre, rue Saint-Guillaume, Paris (building, interiors and furniture, assisted by Bernard Bijvoet and Louis Dalbet): Dr. and Mrs. Dalsace
- 1931–32 Compagnie du Téléphone, rue de la Faisanderie, Paris (remodelling of offices and furnishings)
- 1937 Djemel Anik Country House, near Rambouillet (building and interiors)
- 1939 Soldat Colonial Foyer, Grand Palais, Paris (decorations and furnishings)
- 1940–50 Exhibition layouts for the French Cultural Center, New York
- 1947 Robert Motherwell House, East Hampton, Long Island (studio conversion and furnishings)

Chareau designed much furniture and lighting, and some textiles, from c.1919.

Chermayeff, Serge 1900-1996

Russian-born architect and designer

Serge Chermayeff is perhaps best known for his design work in Britain in the late 1920s and 1930s, during which time his output evolved from a style heavily influenced by the geometric motifs of French Art Deco towards the more austere, Functionalist aesthetic of the Modern Movement for which he became a leading protagonist. As a result of his emigration to the United States in 1939 he played a significant role in furthering Modernist ideology in architectural and design circles across the Atlantic.

During his early career in Britain he found employment at Ernest Williams Ltd., a London firm of interior decorators, from 1924 to 1927. During this time he also designed theatre sets for Gerald du Maurier, a line of work which came to fruition in his first large-scale interior design commission, for the Cambridge Theatre, London, in 1930. Much of his early work derived from school and family connections and, having been introduced to Lord Waring by his father-in-law, he was appointed in 1928 as Director of the Modern Art Studios of the firm of Waring and Gillow in Oxford Street, London. His first major enterprise during his time at the company was the mounting of the 1928 Exhibition of Modern Art in Decorating and Furnishing. This large show included a suite of ten rooms by Chermayeff which echoed the rich decorative ensembles of the French ateliers seen at the influential 1925 Exposition des Arts Décoratifs et Industriels in Paris. As far as Waring and Gillow was concerned the exhibition marked a turning away from eclectic historicism, which had been the hallmark of its craftsmen, towards a more contemporary outlook. This found favour both with the *Architectural Review* and the Design and Industries Association, two agencies which did much to introduce Modernism to a wider, if relatively specialist, audience. The exhibition also marked Chermayeff's links with the French designer Paul Follet, who contributed designs for ten rooms, a partnership that resurfaced in 1931 in their interior designs for the French liner *SS Atlantique*.

By 1929 Chermayeff began to lean more heavily towards the tenets of the Modern Movement, having encountered a

number of leading Modernists, including Erich Mendelsohn, during his travels in Europe. He had also fallen under the influence of the British artist-designer Eric Gill, who instilled in him the strong sense of social purpose in design which had pervaded the work and thought of design reformers from the mid-19th century onwards. He became friendly with leading fine artists of the day including Ben Nicholson, Henry Moore, Barbara Hepworth and Paul Nash, echoing the links between the visual arts commonly found in avant-garde circles on the Continent.

One of the most notable projects with which he was concerned in the early 1930s was the interior decoration of the British Broadcasting Corporation's newly-erected Broadcasting House in Langham Place, London. Chermayeff worked alongside Raymond McGrath and Wells Coates, and his designs exuded the clean lines and forms of the Modern Movement. An important part of the aesthetic derived from the tubular steel furniture commissioned from Practical Equipment Ltd (Pel) whose managing director, Captain Carew, was highly influential in promoting in Britain Modernist ranges to compete with those imported by Thonet and other European companies. He was also concerned with the exploration of new materials and clean, modern forms in his bakelite radio designs for Ekco Ltd., using the possibilities of plastic to produce an appropriately radical design for the new medium of broadcasting.

Another important example of Chermayeff's commitment to Modernist interior design could be seen at the landmark Dorland Hall Exhibition of British Industrial Art in relation to the Home of 1933. Chermayeff's Weekend House, exhibited by Plan Ltd, included entrance hall, living-dining room, kitchen, two bedrooms and bathroom. The design was structurally conceived for economic mass-production. The frames of all the windows and the screen to the dining recess were of anodised stainless steel, while a further large partition was faced with walnut ply in a clear varnish. The floors throughout the single-storey house were of white linoleum and the furniture, although of dark oak, used chromium-plated tubular steel and unit-based structures where appropriate. As Chermayeff himself wrote in an uncompromisingly propagandist essay in *Design for To-Day* in July 1933, "the discoveries of science have changed and improved our living conditions. These forces have brought into being a profusion of new materials which demand a new technique and expression".

Also significant in Chermayeff's Modernist oeuvre was the his auditorium for the De La Warr Pavilion at Bexhill-on-Sea on which he collaborated with Erich Mendelsohn. He was in partnership with Mendelsohn between 1933 and 1936, the two having become friends well before Mendelsohn's emigration from Germany. With its extensive use of modern materials, glass and white stucco finishes, the De La Warr Pavilion embraced a fresh vision of potential patterns of leisure for a new society. However, despite the attention gained from his work at Bexhill and other commissions (including W. and A. Gilbey's Camden Town, London, office building (1937) and the research laboratories for ICI in Manchester (1938), in the unsettled economic and political climate of the late 1930s Chermayeff's private practice in Britain folded, as did many others chasing few commissions in straitened times.

After Chermayeff emigrated to the United States his career

Chermayeff: flat at 24 Upper Brook Street, London, 1935

took on a more distinctly pedagogic flavour with key educational appointments at Brooklyn College, the Institute of Design in Chicago, the Massachusetts Institute of Technology, and Yale University. His interests were more centred upon debates surrounding urban and environmental design issues, as well as writing which resulted in a number of significant texts published between the early 1960s and the 1980s. Although still involved with interior design in the post-war years, albeit generally within a wider environmental context, his commissions in this sphere of design were more limited. Among the best known were those for British Railways offices at the Rockefeller Center, New York (1950) and the Chermayeff House in New Haven, Connecticut (1962).

JONATHAN M. WOODHAM

Biography

Born Sergei Ivanovitch Issakovitch, in Grozny, Azerbaidzhan, Russia, 8 October 1900. Resident in England from 1910: naturalized, 1928; emigrated to the United States, 1939: naturalized, 1946. Educated at Royal Drawing Society School and Harrow School, London, 1910–17; studied art and architecture in Europe, 1922–25. Married Barbara Maitland May, 1928; two sons, the graphic designer Ivan Chermayeff, and the architect Peter Chermayeff. Journalist for the

Amalgamated Press, London, 1918–23. Chief designer for decorators Ernest Williams Ltd., London, 1924–27; director of Modern Art Department, Waring and Gillow furnishers, London, 1928–29; co-founder, furniture retailer Plan Ltd., 1932 (sold 1936). Active as a designer of furniture, clocks, rugs, textiles and radios from 1930s. Established own architectural and design practice in London, 1933–39 (partnership with Erich Mendelsohn, 1933–36), in San Francisco, 1940–41, and in New York, 1942–46; in partnership with Heywood Cutting, 1952–57. Professor of Design, Brooklyn College, New York, 1942–46; President of the Institute of Design, Chicago, 1946–51; lecturer, Massachusetts Institute of Technology, Cambridge, 1953–62; professor of architecture, Harvard Graduate School of Design, 1953–62; professor, Yale University, 1962–71, emeritus from 1971. Gropius Lecturer, Harvard University, 1974; Distinguished Visiting Professor, Ohio State University, Columbus, 1979. Fellow of the Royal Institute of British Architects and the American Institute of Architects. Died 8 May 1996.

Selected Works

The Serge Chermayeff Archive is in the Avery Library, Columbia University, New York. A comprehensive list of Chermayeff's architectural projects and designs appears in Plunz 1972.

Interiors

- 1928 Exhibition Layouts, Waring and Gillow, London
- 1930 Chermayeff Apartment, London (interiors)

- 1930 Cambridge Theatre, Seven Dials, London (interiors)
- 1931 *S.S. Atlantique* (ship interiors; with Paul Follot)
- 1932–34 British Broadcasting Corporation, Broadcasting House, London (interiors; with Wells Coates and Raymond McGrath)
- 1933 Exhibition of British Industrial Art in Relation to the Home, Dorland Hall, London (Weekend House interiors and furnishings)
- 1934–35 De La Warr Pavilion, Bexhill-on-Sea, Sussex (auditorium interiors; with Erich Mendelsohn)
- 1935 Nimmo House, Chalfont St. Giles, Buckinghamshire (building and interiors; with Erich Mendelsohn)
- 1937 Heywood-Lonsdale flat, Connaught Place, London (interiors and furnishings)
- 1938 Chermayeff House, Bentley, near Halland, Sussex (building and interiors)
- 1944 *Design for Use* (exhibition layouts), Museum of Modern Art, New York
- 1950 British Railways Offices, Rockefeller Center, New York (with Ketchum, Gina and Sharpe)
- 1962 Chermayeff House, 28 Lincoln Street, New Haven, Connecticut (building and interiors)

Chermayeff designed tubular steel furniture for Pel (1931–32); Unit furniture for Plan Ltd. (1932–36); lighting for Best and Lloyd (1930s). He produced radio cabinet designs for Ecko (1930s) and carpet designs for Wilton Royal Carpet Factory, Salisbury (from 1929).

Chests

Chests are essentially barriers: they mark the boundaries of ownership, and protect valuable goods from damage or theft. Light basketwork chests have been made throughout history – the ancient Egyptians used them, and China exports quantities of inexpensive wicker hampers today – but wooden chests have addressed the need for security as clearly as that for storage. In the Middle Ages many chests were really strong-boxes, with stout oak or walnut construction, multiple locks, and imposing metalwork; softwood chests were often virtually wrapped in iron. Substantial medieval households commonly owned 75 or more; in 1405 the Duchess of Burgundy had 154 chests stashed in just one room. Inventories of the period reveal a fascinating array of goods stored in chests: coin, plate and precious jewelry, of course, but also linens, silks, furs, chapel vestments, candles, books and papers, armor, weapons, banners, even grain and spices. Most early chests had undifferentiated interiors, but vertical dividers were not uncommon. Cypress or cedar chests were often specified for linens, and aromatic herbs might be tucked in to help deter insects; small compartments were sometimes built in for these herbs. By the 18th century chests were commonly lined with paper to protect their contents from dirt and insects.

Portability is the chest's second virtue. Although many variations have been devised, two forms are basic to the Western tradition: flat-topped chests with legs, and domed-lid chests that sit directly on the ground or on a low stand. Domed lids were designed to dispel water, and were often covered with leather as a protection against the weather after Islamic craftsmen introduced Spanish Leather into Europe in the 14th century. Iron handles were fixed to the sides for easy handling, and flat bottoms allowed them to be conveniently stacked and strapped to a cart. This type is still recognized as a travelling trunk, although late versions covered with velvet were often highly impractical. A few wheeled chests survive; in Japanese homes of the early- to mid-Edo period, chests with wooden wheels were rolled away to store bedding during the day. Footed chests were better-suited to storage on damp floors of earth, brick, or stone, but awkward to move. Still, a surprising number survive with iron handles, and even massive footed chests seem to have been loaded into large packing boxes called *babuts* and carted away when medieval nobility decamped.

Carts or bearers were also weighed down with chests for weddings: elaborate dowry or marriage chests advertised the social position of a bride's family, and together with their contents, they generally represented women's only personal wealth within marriage. Marriage chests were probably used in most ancient cultures which instituted dowries: the famous silver casket of Secundus and Projecta from 4th-century Rome offers a tantalizing hint of their form. The Italian cassone of the 14th through 16th centuries are among the few marriage chests which can be confidently identified; these typically depicted the arms of both families, and their decoration was often playfully erotic. Korean brides' chests of the Yi Dynasty included symbols of fertility and prosperity in the design of their metal fittings, and in China similar chests were lacquered red, the color of good fortune. Most Western marriage chests were denoted as such by the initials and dates included in their

decoration. Because of their symbolic value, marriage chests (also called hope chests or trousseaux) survived in use much longer than other types.

Chests were the most important pieces of case furniture in medieval Europe: they were omnipresent even in modest homes, and grand manors had chests in every room. Flat-topped chests served as seats, tables, or even beds in addition to providing storage; placed against walls and padded with cushions, they suggested the later box-settle. Chests were often set along the foot or side of a bed as a combined step, table and bench. One long chest or a row of smaller ones ranked at bedside created the impression of a large platform bed. The chest's role diminished gradually in the 15th century, as feudal life became more stable and forms like the open cupboard and cabinet were introduced. They were supplanted by chests of drawers in fashionable interiors by about 1650, although chests continued to be showcased in provincial areas into the mid-19th century. Today only toy chests and cedar chests for woollens are in regular use, although old-fashioned trunks and painted "country" chests are still favored as accents and occasional tables.

The most primitive chests were hollowed-out logs, sawn on one side to lie flat and secured with iron bands; this type was used as a collection box by the early church. Domed lids are vestiges of this technique, to judge from surviving board chests with thick curved lids cut from logs. Luxurious chests with sophisticated joinery, veneering and inlay were made as early as the 4th Dynasty in Egypt, and survive in quantity from later burials. Those in common materials were painted to imitate ebony, ivory, gilt and marquetry. Many were made with gabled lids or lids that slope to a gentle arch at one end, like the roof of a shrine, and nearly all stand on legs. They were "locked" by lashing cord around fat knobs on the lid and carcass and applying a seal to the cord. Greek and Etruscan chests generally resembled Egyptian models, but Pliny listed a wide variety of woods unused in Egypt. Imported citron was apparently most favored, and Pliny sneered at painted imitations of its grain. The Roman *arca* were being edged out by *armarium* (wardrobes) by the Hellenistic period, but chests of board or frame-and-panel construction were common articles in Byzantium, painted or decorated with marquetry and veneer. The most splendid were veneered with carved ivory.

In most of medieval Europe, metalsmithing was more advanced than carpentry, and wrought iron was used extensively to decorate and reinforce board chests. Paint (often on a gesso ground) was much more frequently used than surviving examples suggest, and brilliant reds, greens, blues and gold were favored. Chip carving was widely used in the Romanesque period, and sustained its popularity in Scandinavia and Germany into the modern era. A chest's stiles or sides could be extended to form board feet; these were sometimes softened with carved brackets, but most footed chests were starkly rectilinear. After about 1200, however, Gothic tracery and linenfold carving contributed to more unified, architectural designs. Spanish Gothic resembled that of the rest of Europe, but under the Islamic influence, Spain also developed a mosaic-style inlay called *Mudejār* for chests and other furniture. Panel and frame construction was adopted in the 15th century and became standard for European oak

chests, with carved and painted decoration which usually articulated the framed structure. In Paris, walnut was increasingly preferred for finely carved furniture, and by the 15th century the feet of French chests were often replaced by a solid plinth. Most were decorated with bays of architectural ornament, but some of the finest examples were carved with chivalric scenes that spanned the entire façade. Italian chests of the same period also displayed fine carving, but moulded gesso ornament, brightly painted and gilded, seems to have been especially popular in Italy. This treatment, while much less expensive than carving, gave a similarly rich effect. It was often combined with inset painted panels in early Renaissance cassoni.

Inspired by antique sarcophagi, 16th-century Italian furniture shops developed the plinth chest into a new form. The most elaborate high Renaissance cassone were carved in deep relief with friezes of classical scenes, caryatids at each corner, lions' paw feet and deeply moulded lids. This type was not widely imitated outside Italy, although carved Renaissance ornament was readily adapted for the older plinth form. Italian intarsia, or marquetry, spread quickly throughout Europe in the 16th century and was particularly influential for German and Netherlandish chests, which evolved into bold architectural forms. By the mid-17th century, however, the chest was eclipsed by sophisticated cabinets and chests of drawers. Joiners tried to compete by offering chests with two drawers near the base, or tall stands to prop them up to cabinet height – but the cabinet-makers' day had dawned. Although Gothic Revival and Arts and Crafts designers admired the decoration of medieval chests, the forms they favored – like the cupboard, or cabinet on stand – were more complex. Today only antique or heirloom chests still hold pride of place.

Chimneypieces and Chimney Furniture

Chimneypieces first developed when the Normans began building fireplaces against the walls of their multi-storeyed castles in the 12th century, although central fires remained common in poorer European homes before 1600. The earliest were only slightly recessed, with angled flues that required massive, sloping hoods. These were usually conical, supported by pillars or projecting corbels, and looked somewhat like huge tents pitched against the wall. In small chambers they could be fitted into a corner, where they were less obtrusive; in vernacular and cottage architecture, corner hearths have survived into the 20th century, particularly in Scandinavia and Latin America. After 1250 deeper hearths with vertical flues permitted smaller hoods, and by the early 1300s construction improvements had made them virtually unnecessary. But the hood was slow to disappear, especially in northern Europe. The bulky conical form was gradually replaced by a flat, truncated pyramid, which remained typical from about 1400 through the mid 16th century. Both types were usually plastered and brightly painted: coats of arms and mottoes were favored motifs, and in Italian villas chimneypieces were integrated into extensive painted friezes. As hoods became less prominent, fireplace surrounds in grand rooms were articulated with four-centered or Tudor arches of wood or stone, moulded profiles, and carving, especially on the spandrels and lintel.

During the 16th century wall fireplaces became widespread, and rough versions were simply built with deep timber or stone lintels flush to the wall. But money did not guarantee comfort, and domestic life in poor and wealthy homes alike revolved around the fireplace in cold weather and at night, making the chimneypiece a natural focus for decoration. Renaissance architects kept tinkering with the pyramidal hood, and by 1525 important chimneypieces were transformed into elaborate architectural confections with waisted sides, carved figures, mouldings and full entablatures. Pillars and corbels became classical pilasters, columns, or caryatids, and eventually the vestigial hood was completely dissolved in sculptural ornament. Mantelshelves were incidental elements as yet, although deep mouldings made convenient homes for small items. Architects and contractors lavished attention on emphatic, projecting chimney breasts and overmantels that grazed the ceiling, retaining the chimneypiece's traditional height and mass for symbolic and artistic effect, rather than practical necessity. Even fully-recessed fireplaces, neatly framed with mouldings, could be expanded with illusionistic mural decoration. The Italians preferred richly colored polished marble, while the rest of Europe relied chiefly on wood, limestone or painted plaster; but in either case the glistening carved and moulded surfaces were at their best in the evening, enlivened by deep shadows and flickering firelight.

Before glazed tiles became fashionable in the 17th century nearly all hearths were brick or stone, and the back wall was frequently protected by a cast-iron fireback. These could be quite ornate, and many examples included heraldic motifs, a date, and the owner's initials; in provincial areas firebacks remained important into the mid 19th century. Firedogs, or andirons, were first developed for open hearths, and their ancient animalistic form underlies even the most fantastic later

designs. In addition to logs, firedogs could support crossbars or even stands for jugs of wine. Most were iron, but brass, steel, or silver reflected the light brilliantly. Their prominent position made them ideal showcases for fine metalwork, and by 1600 firedogs were often purely ornamental, their massive pillars extending halfway to the fireplace lintel. Small, plain andirons called "creepers" served for shorter logs, and preserved the symmetry of their decorative cousins. Tongs, billet hooks and forks were used to handle burning logs, and shovels and brushes cleared the ashes; a bellows was especially useful if the fire was used for cooking. Handled tools could be supported with hooks just inside the chimneypiece, but in many households they were simply propped nearby when not in use. Such tools were increasingly sold en suite with the firedogs as the 16th century wore on. In very wealthy homes, a hierarchy of silver-, brass- and iron-handled hearth equipment marked each room's relative importance.

Architects' engravings of chimneypiece designs were widely circulated and copied after 1630; most originated in Paris, and designs by French Baroque architects like Jean Barbet, Jean Le Pautre, and Daniel Marot contributed to the development of a truly international style. The preferred form was a flat, projecting chimney breast terminating in a cornice at the ceiling, with a related cornice surrounding a lowered fire-opening. This integrated, logical, and relatively simple structure could be extended to the wall panelling, while rich embellishments – scrolled cartouches, pediments, and naturalistic carving – maintained the chimneypiece's dominance. In complex schemes paintings and tapestries were specially fitted in the overmantel. Toward the end of the 17th century large (and extremely costly) mirrors were available to the French aristocracy; as they became less precious, mirrors usurped all other types of ornament for the overmantel. In the Netherlands, conservative taste retained protruding chimney breasts that suggested hoods; combined with fashionably emphatic cornices, these evolved into deep mantelshelves ideal for displaying porcelain. A fabric valance was usually hung below the shelf to trap smoke. Most wealthy patrons preferred colored marbles by this period, but wood, rougher stone and plaster were more common. The walls of 17th-century Dutch and Spanish hearths were often lined with bright, easily cleaned tin-glazed earthenware tiles, and this fashion spread rapidly to England and northern France.

Late 17th-century firedogs became shorter in proportion with the hearth, and balusters, pyramids, urn or flame shapes and enormous, gleaming globes replaced more ornate types. As wood became scarcer and more expensive in Britain, many fireplaces were re-fitted for coal, and newly built hearths were considerably smaller to accommodate the new fuel. Iron fire-baskets, raised on firedogs or their own legs, had appeared by the mid 16th century, and gradually evolved into compact grates which burned coal efficiently. Two forms were typical from the early 18th-century: hob-grates of iron crossbars supported by solid cast-iron sidepieces, or hobs; and free-standing dog-grates, which were suspended between prominent side pillars resembling firedogs. Elegant fenders and fire-screens – usually of pierced or latticed metal – were developed by 1750 to prevent hot coals from rolling into the room. Fenders were also convenient resting places for fire equipment. Coal required a shovel, poker and tongs, which might be

Chimneypieces: drawing room, Loseley House, Guildford, Surrey, c.1570

supplemented by brushes and bellows; fuel was stored out of sight in baskets or, by the Georgian period, in metal coal-scuttles. It was not until after 1850 that decorative coal-scuttles emerged from the closet as part of the hearth's kit.

Fireplaces designed for coal-grates could be compact and somewhat austere, at least by comparison to the extravagant designs of the 17th century. Fine chimney surrounds in 18th-century British townhouses often relied on carefully selected marble and simple mouldings for their effect. Marble "cheeks" or slips, inserted between the stiles and the grate, were judiciously chosen to complement the surround. In North America and on the Continent, improvements to the wood-burning grate eliminated most of the smoke and, like British coal fires, permitted much smaller fireplaces. This reduced scale suited the Rococo environment's intimacy and delicate, fluent use of line. Fullblown Rococo chimneypieces relied on gilt (or, less often, silvered) mirror frames, candle-sconces, and carved or applied foliate ornament to dissolve their mass, and their creamy white or veined marble was critical to the room's color scheme. Matching hearth furniture added to the unified effect, and the splendid sculptural firedogs, or *chenets*, made by 18th-

century French bronze-workers were in demand throughout Europe. *Chenets* were essentially ornamental, and in this sense closely related to the evolving fashion for garnitures. For very grand chimneypieces, specially designed firebacks, mantel friezes, columns and busts were also produced in gilt-bronze.

Late Georgian architects advocated precisely symmetrical central chimneypieces, ideally flanked by windows and facing a door. Whenever possible they eliminated the projecting chimney breast and outlined the fireplace with shallow, subdued marble or wooden mouldings; light classical motifs, carved or moulded of composition, were the favored ornaments. By 1790 the overmantel had been reduced to a spare frame for paintings or mirrors. Wallpaper and fabric hangings extended above prominent mantelshelves, which held careful arrays of paired candleholders, vases, figures and – almost always – a clock. Tin-glazed earthenware tiles were popular slip facings, and the slips themselves were incorporated into many of the new register grates: these filled the entire opening, and adjusted to regulate the draft. Register grates were sometimes offered with hinged shutters to replace the traditional chimneyboard. Hob- and dog-grates, however, remained

Chimneypieces: *Cheminées à la Moderne* and *Cheminées à l'Italienne*, by Jean Le Pautre, 1660s

popular outside Britain and are still used in large fireplaces. Grates were offered in a wide variety of designs; although polished steel and brass were more prestigious, the market was dominated by cast iron. Franklin stoves, in use in the United States by 1785, originated as a hearth surround, liner and grate cast in one unit. These developed into enclosed wood and coal stoves, which soon found almost universal favor among the middle class – everywhere but in Britain.

By 1810, the chimneypiece had been stripped to essentials. Flat slabs of reeded marble or painted wood, their corners punctuated by square tablets, created a severe classical effect, and polished ornaments and hearth furniture shone against the preferred soft white, grey or black veined marble. Overmantels were often omitted – even in the finest rooms – in favor of independently framed paintings or mirrors. Short mirrors reaching just above the top of the mantel ornaments were elegant and much cheaper than the enormous vertical glasses favored by the wealthy. On less restrained chimneypieces, Greek and Egyptian Revival motifs were picked out with applied composition or gilt metal, and sleek freestanding columns supported the mantelshelf. Splayed hearth walls, which improved the draft, caught on slowly by mid-century, and low stone curbs were also introduced during this period;

combined with a mesh fire-screen, curbs could replace the fender. They were generally designed to match a moulded marble or stone surround. Iron hearth furniture was routinely polished with graphite, or “black-lead”; if the hearth walls were brick or stone, they might be black-leaded while in use, then whitewashed for summer.

Carved ornament began creeping back by 1840 on the broad spandrels of Gothic Revival and rounded “Romanesque” arches. But many early Victorians simply draped their old-fashioned chimneypieces with fringed or tasseled velvet, silk or lace in a vaguely Turkish manner – although the style actually originated in France. Deep flounces on the mantelshelf became almost obligatory after 1840, and often chimneypieces were completely curtained when not in use. This style prevailed until the 1860s, as historicism developed in earnest: bulky Renaissance Revival forms renewed the chimneypiece’s sculptural prominence, and the Aesthetic emphasis on collecting encouraged huge overmantels packed with fancy brackets, mirrors and cabinets. Late Victorian chimneypieces also shouldered a moral burden as the “heart” of the home, and cozy hearths increasingly symbolized refuge from the pressures of modern life. Designers and manufacturers responded with goods in a bewildering variety of styles.

Aesthetic motifs like the sunflower and peacock were applied freely to commercial hearth furniture, and “encaustic”, transfer-printed and “art” tiles were specially made for hearths, fireplace slips and mass-produced register grates. Entire chimneypieces were available in cast iron from about 1850, and trade catalogues bulged with ready-made overmantels for the middle-class.

Arts and Crafts Movement designers also concentrated their energies on the fireplace, designing hand-painted tiles, hand-forged firedogs, hammered copper hoods and wood, stone or brick chimneypieces inspired by medieval, folk and – in the United States – colonial architecture. Richard Norman Shaw was among the first to rediscover the inglenook, which became a signature element in Arts and Crafts interiors; in place of a built-in inglenook, one could purchase a fender specially fitted with leather seats. Ironically, this emphasis on large, old-fashioned chimneypieces coincided with the rise of central heating.

By 1900 the fireplace was shrinking again, and the overmantel virtually disappeared within the next decade. Light Adamesque surrounds, simple facings of plain tiles, and flat expanses of marble or glass appealed to the modern taste for expensive restraint. Fire tools were sold with matching, free-standing racks, as they rarely fit in newer fireplaces. Electric fires were introduced in the 1920s, and both streamlined versions and the illusionistic “Magicoal” were installed like fireplaces; by the mid 1930s, louvered, polished metal vents concealed their electric coils. In Europe, sleek hoods bridged the taste for modern and vernacular-style architecture. Modern architects preferred asymmetrical fireplaces with sweeping, horizontal lines and stepped tiers or flat, flush surfaces, and they generally eschewed the mantelshelf. In open-plan interiors, flues might be re-routed to leave a clear view over the fireplace. Simpler solutions devised in the 1950s included egg-shaped revisions of the cast-iron stove and island fireplaces, in which the fire is built on a low pedestal below a freestanding or partially engaged hood. Both of these remained stylish through the 1960s – the stoves in bright enameled colors, and the fireplaces richly surfaced with rough stone, slate, mosaic or glazed tile. Sunken conversation pits often centered on these pared-down hearths. In the early 1980s Postmodern architects began designing coloristic fireplaces based on classical elements and a loose, witty approach to 1930s style, but these have proved less influential than the recent interest in authentic decor.

Since the 1970s, salvaged and reproduction chimneypieces have become immensely popular for both new and old homes. Glass shutters offer a compromise between aesthetic effect and the recent concern for energy efficiency.

China

The subject of traditional Chinese interiors is many faceted and reflects the long continuous cultural development throughout the nearly ten thousand years of China's history. It is perhaps because the notion of interior decoration is somewhat more Western in concept that the subject has not been approached with any comprehensive study to date. Perhaps, too, it is because the romantically idealized view of a traditional Chinese interior differs so vastly from that of the general Chinese populace. A narrow study of any cultural aspect must embrace important relationships with its history, philosophies and religions, political and economic structures, social structures and moral codes, art and architecture, and foreign influences. This introductory survey will touch upon these various

China: *The Night Revels of Han Xizai* (detail), 12th-century copy of painting attributed to Gu Hongzhong, Five Dynasties period, 10th century; hand scroll, ink and colours on silk

factors to understand better how traditional Chinese interiors fit into the concept of interior decoration.

The essay begins with a review of the historical background. Excavations in central China at Hemadu reveal that timber frame construction had already developed nearly 7,000 years ago. These long buildings probably provided shelter for tribal communities who hunted and fished for food. Since Neolithic times, dwellings were optimally sited in relation to the sun, and sat upon built-up platforms of rammed earth.

Depictions on Shang dynasty (16th–11th century BC) bronzes and stone carvings illustrate figures resting on their haunches or sitting on woven mats with low tables set in front of them. Numerous examples of lacquered furniture – low tables, armrests, beds, chests – have been excavated from tombs dating the Eastern Zhou period (770–256 BC) and are representative of those that were used in the daily life of the aristocratic ruling class. The aesthetics and structural conceptions of furniture excavated from the former state of Chu, active during this period, demonstrate designs which blend simplicity with elegance. Their surfaces are often colorfully patterned with contrasting red and black lacquer, and were sometimes simultaneously decorated with relief and incised carving. Eastern Zhou bronze lamp stands have also been excavated which, besides their functionality, have a high artistic sculptural quality. Decorative patterns for doors and windows noted in the contemporaneous Chu dictionary (*Chuci*) also reflect an early architectural woodworking tradition that was to last for thousands of years.

During the Han dynasty (206 BC–220 AD) furniture continued to characterize a lifestyle at ground level. Woven mats, used for sleeping as well as sitting, had also become a standard of measurement for rooms, like the *tatami* which still exists in present-day Japan. Wall murals and stone engravings illustrate low couches, or platforms, elevating a master or special guests in a distinguished seat of honor; decorated screens were often placed behind the couch. Besides the honorific and decorative

use of the screen, the literal terminology “windscreen” (*pingfeng*) also implied its functional use to provide protection against drafts. Although clothing was the principal means of keeping warm, excavated materials, as well as early records from the earlier Zhou period, indicate that bronze braziers and fire pits built into the floor were also used to provide a localized heat source during the cold winters. Bamboo-plaited baskets, clothes racks, granaries, and cabinets as well as utensils for eating and drinking and writing materials that are known from this period are all of excellent workmanship. These pieces also reflect the thoughts of the Han dynasty philosopher, Yang Xiong, who wrote: “Substance without beauty is rough, and beauty without substance is futile. Their combination, however, is an external exemplification of eternal principles.”

Tomb pottery models of buildings, as well as stone engravings from the Han period, convey more information relative to the contemporary architecture of houses, pavilions, and watch towers. Small houses were commonly raised on stilts, and were divided into three bays which opened to a courtyard. A pottery relief brick depicting an estate at Chengdu illustrates an entire compound surrounded by a wall with tiled eaves. A gate on the southern wall opens to a three-bay building with no interior divisions. Screens and curtains would have been used to divide and enclose the open space to protect from drafts and sunlight.

During the Han dynasty China’s domain expanded and brought her into contact with nomadic tribes in more remote regions. The influences from this exposure were further popularized by the Han emperor Lingdi (reigned 168–188 AD) who had a strong fascination with foreign curiosities, including the folding stool, which was then termed a “foreign” or “barbarian” seat (*huchuang*). These portable seats were commonly used by nomadic tribes in the more remote northern and western regions, and were also used for mounting and dismounting horses. Today it is generally thought that the popularization of the *huchuang*, as well as the simultaneous

China: *Meeting with the Matchmaker*, woodblock print, illustration to *Jin Ping Mei*, published Ming dynasty, Chongzhen period, 1628–42

eastward migration from India of the raised dais associated with Buddhist art influenced the shift in seating from mat to chair level over the next few centuries. After the Han dynasty a greater variety of seating furniture began to appear; however, these seats were primarily used to elevate priests or high officials in distinguished positions of honor.

During the Tang dynasty (618–907 AD) the sphere of China extended once again to distant foreign lands, and considerable influence was assimilated from Middle Eastern cultures. At this time raised seating around high tables had become more common among aristocratic circles. A Chinese-style armchair, preserved from this period at the Imperial Treasury in Nara, Japan, is made from zelkova with tapering square-cut members and finished with a dark lacquer. This chair also closely resembles armchairs illustrated in Buddhist wall paintings at Dunhuang from the same period. Tang pottery figurines and paintings often depict ladies sitting upon high hour-glass shaped stools, as well as elaborately carved stools. The popularization of the raised box platform for seating is reflected in many representations in paintings and wall murals such as those from Dunhuang. These latter records also depict such

platforms arranged with canopies, which mark the advent of the canopy bed.

The 10th century painting *The Night Revels of Han Xizai* illustrates a series of scenes representing the official Han Xizai which were recorded by the court painter Gu Hongzhong in an attempt to discredit Han Xizai's licentious activities. This record of revelry has also become a highly valuable reference for the material culture of the Tang and Five Dynasties periods. Some of Han Xizai's guests sit upon large couch beds surrounded with decorative railings. Men sat on yokeback chairs draped with silk chair covers, some with feet pendant, others sitting with legs crossed. Ladies sat on large round stools. Food and wine was served upon high tables. Large standing screens were decorated with painted panels and provided space division. Canopy beds were draped with brocaded silks, and high racks stood at one end to provide a place to hang bed covers and clothes.

Architecture and furnishings of the Song dynasty (960–1279) are both considerably lighter and airier in structure than that of the preceding Tang and Five Dynasties periods. This stylistic shift was likely due as much to severe timber shortages, necessitating more resourceful use of materials, as it was to the overall intellectual and artistic climate of what is considered to be one of China's most glorious periods. New techniques and tools emerged which permitted the use of smaller components firmly secured to one another with ingenious systems of wooden joinery. The Song architectural treatise *Yingzao fashi* documents a fully developed building system which was to change very little in the following centuries. During this period, the chair height mode of living had become assimilated into common life. Paintings also record that many of the traditional furniture forms, which in modern times have been popularized as "Ming-style," were actually already developed by this time; however, virtually no extant pieces of Song period furniture are known to have survived. Nevertheless, both the traditional furniture styles and furniture arrangements which are considered "classical" today were likely established during the enlightened age of the Song dynasty.

Concepts about traditional Chinese interiors are mostly sourced from extant examples of traditional furnishings, visual reference materials, and literary writings from the Ming dynasty and afterwards. Many more furnishings from the Ming (1368–1644) and Qing (1644–1911) periods have survived, including furniture made from lacquer, hardwoods, bamboo, rattan, and roots. Of these, those made of tropical hardwoods have survived in the greatest numbers because of their general characteristics of durability and resistance to decay. In recent decades, collections formed of late Ming and early Qing tropical hardwood furniture reveal a variety of simple, elegant, and robust designs that rival the world's best furniture-making traditions.

In 1567, because of the depletion of silver from the Imperial treasuries, the ban on maritime trade was lifted in order capitalize on Spanish silver coming into the Philippines from Central America. It is simultaneously at this time that furnishings made of tropical hardwoods such as *huanghuali* begin to appear in much greater quantity. Chinese cargo ships frequented ports in Southeast Asia, including Hainan Island and the Spanish-controlled Philippines where goods were traded for silver, as well as for precious hardwoods. It is after

China: hall with a couch, opening onto a garden; gouache painting from *Essai sur l'architecture chinoise* (Bibliothèque nationale, Paris)

the lifting of the ban that Fan Lian notes in his *Record of Things Seen in Yunjian*:

When I was young I never saw any fine quality hardwood furniture such as desks and large chairs. The rich people only had square tables in gold-colored transparent lacquer or in ginkgo wood. Mo Tinghan and the sons of the Gu and Song families began to buy a few fine quality hardwood objects from Suzhou and bring them to Yunjian [Songjiang]. During the Longqing and Wanli periods (1567–1620) even lower officials began to use fine quality hardwood furniture in their homes. Cabinet-makers from Huizhou opened shops in Yunjian, making wedding furniture and other objects. The wealthy people would not use elm (*ju*) wood and had their beds, cabinets, and tables made from *huali*, burl wood, ebony, *jichi* wood, and boxwood. It became fashionable to spend thousands of *taels* on a single piece. Even policemen who owned a house would decorate a room with wooden partitions. In their gardens they have flower pots and bowls of goldfish. Inside they would have a good quality wooden desks and a horsetail whisk for dusting the room they called their study, but what books they studied is open to question.

Although the Ming government was struggling with its depleted treasuries, the passage above reflects a flourishing merchant economy during the late Ming period that was to last for several decades. Anxious antipathy is also reflected here about the *nouveau riche* merchants and low officials who were leading extravagant materialistic lifestyles in some sort of imitation of the literati officials. This situation was quite contrary to traditional sumptuary regulations and fundamental social principles of state and, in fact, was to spur numerous publications on connoisseurship and taste from various members of the literati. Perhaps the most renowned of these was Wen Zhenheng's *Treatise on Superfluous Things*. This work contains a number of ideas regarding the propriety or unsuitability of interior furnishings and interior arrangements in terms of "elegance" (*ya*) or "vulgarity" (*su*), grouped together with ideas about garden arrangements, trees and flowers, fish and birds, clothing and ornament, boats and carriages, vegetables and fruits, incense and teas, brushes, paper and ink, and the care and hanging of paintings. For the late Ming literati, the idea of interior design fits into an entire lifestyle of elegant refinement. Nonetheless, the chapter devoted to furniture opens:

When the men of old made tables and couches, although the length and width were not standardized, they were

China: album leaf attributed to Qiu Ying illustrating *Dream of the Western Chamber*; Ming dynasty (15th–16th century)

invariably antique, elegant and delightful when placed in a studio, or for sitting up, lying down or reclining. In moments of pleasant relaxation they would spread out classic or historical texts, examine works of calligraphy or painting, display ancient bronze vessels, dine or take a nap, as the furniture was suitable for all these things. The men of today make them in a manner which merely prefers carved and painted decoration to delight the vulgar eye, while the antique pieces are cast aside, causing one to sigh in deep regret.

Relative to arrangements, Wen repeatedly advises the reader to avoid excesses in numbers of pieces in a room or tables cluttered with objects. It was considered to be of poor taste to hang a set of four paintings on the walls of a single room. The placement of flowers on the desk in a study was utterly unacceptable. The appropriate use of furnishings according to the size of the room as well as according to the season was also part of the general formula for elegant taste.

The publication of illustrated books and novels was also popularized during the late Ming period. These woodblock print illustrations often depicted interior scenes which can be used as reference for interior design and the arrangement of furnishings. A late Ming woodcut from the novel *Jin Ping Mei* illustrates such a scene. (Ironically, this novel features a wealthy merchant, typical of the late Ming period, who epitomizes those despised by the contemporary literati.) Three steps

lead up from a garden courtyard onto an open-front building with carved balustrade railings; the back and the side walls otherwise enclose the space. Although the perspective and proportion is somewhat distorted by the traditional “bird’s-eye” viewpoint, the panel between two columns near the center-line of the room should separate the room into two equal spaces. The long side table with sharply upturned ends and end panels decorated with *ruyi* is centered against the central dividing wall panel. Laid out upon its surface are an incense box, a censer and a vessel with incense tools; set out on one end is a flowering sprig arranged in an antique vase. A scroll painting of a figure hangs against the wall above the table. A typical Ming period table of minimalistic form is placed against the side wall and supports a small decorative screen framing a Dali marble panel. In this particular scene a matchmaker is about to introduce a prospective couple, and thus three handsome yokeback chairs have been specially set out and arranged for the occasion. Master Ximen Qing, the prospective groom, occupies the seat of honor which is centrally arranged to face out onto the courtyard. The prospective bride takes the position in the more distant of the adjacently arranged chairs; the matchmaker is showing Ximen her lovely feet. There are literally thousands of such illustrations from the Ming and Qing periods which are just as rich in interpretive detail. However, the source of these publications was mostly concentrated in Zhejiang, Jiangsu, and Anhui, and thus

it must be borne in mind that these illustrations mostly reflect the architecture and furnishings from wealthy estates in those southerly regions.

A major point in the evolution of decorative arts is marked by the reign of Qianlong (1735–95) during the Qing dynasty. Like other emperors he highly venerated the knowledge of the ancients and, with dominating influence in the Imperial Workshops, effected archaistic tendencies in the decorative arts to communicate this devotion. Qianlong also loved a precious tropical hardwood called *zitan* and monopolized its few remaining supplies. *Zitan* is an extremely dark and heavy wood; because of its scarcity, however, popular furniture often imitated its appearance with a coating of a deep reddish-black semi-transparent lacquer, or was made from another similar but much more available dark wood called *hongmu*. Scarcities of rare hardwoods also resulted in the production of decorative furnishings composed from mixed materials which were often artistically conceived, as well as the use of thin veneers of rare hardwoods facing softwood cores. Qianlong's expeditions into Burma near the end of the 18th century also reinvigorated the trade route to the southwest resulting in large supplies of highly-figured marble coming out of the nearby Dali region in Yunnan province; those figured like traditional landscape paintings were often given inscriptions, framed and hung on walls; secondary panels became extremely fashionable as decorative inlays for furniture.

A manuscript in the Bibliothèque Nationale in Paris contains a set of gouache paintings depicting interiors of houses in Beijing. These paintings, dated to the 18th century, illustrate the formalized interiors and decorative furnishings of the elite at that time. In one, the relationship of the interior to the walled garden courtyard and to the distant landscape visible through the moon gate has a striking effect. It is not really clear where the interior begins or ends until one has descended the outermost terrace. Inside however, the spaces are divided with lattice partitions made up of mixed woods. The upper panels are decorated with small paintings and calligraphy, and the lower panels with archaic designs typical of the period. The decorative brackets visually reinforce the juncture of the horizontal and vertical panels. Their carved openwork design of angular scrolling is also another archaistic tendency derived from the decoration of early bronzes. A couch-bed set at the center emphasizes the symmetrical layout. Its railings are ornamented with panels of Dali marble. The refined elegance and formal atmosphere of this space differs greatly from the robust and rounded decoration found in the late Ming architecture at Anhui to be discussed below.

Western missionaries were also gaining more respect at court for their knowledge, and often presented the court with gifts of Western decorative art and introduced European Baroque architecture. After the Opium War in 1840, Western influences were even more pronounced. An eclectic blending of Chinese and Western decorative motifs can be witnessed in furnishings from this period, especially in the larger cities and coastal regions where there was more frequent contact. In remote inland areas, Western influence was hardly noticed until recent times. Deteriorating economic conditions and a severely weakened political structure in the 19th century contributed to a general decline in quality in the decorative art produced at that time.

Having briefly reviewed the historical background, the next section focuses upon a discussion of traditional Chinese architecture. Chinese society may be loosely defined as a class society which, outside of the Imperial circles, was traditionally divided into four classes. These followed, in descending rank, military and scholar-officials; merchants; artisans; and peasants, although actually, these divisions do not reflect the much broader diversity of the Chinese population, nor the interplay between them. Chinese society was also strongly influenced by Confucian principles since the tumultuous Warring States period (476–221 BC). These principles were eventually codified into a system of social morals by which society could govern itself based upon virtuous rule throughout a hierarchical network of relationships. These relationships of man to elders, wife to husband, son to father, etc., evolved into a complex system of social protocol which in turn influenced interior space division as well as furniture arrangements. Gender division was also a factor, and a husband of wealth and rank often had a wife and several concubines who all occupied separate quarters.

Sumptuary regulations – ranging from the use of personal ornament to the size and architectural style of housing – provide a means of differentiating rank and class in Chinese society. The type of jade ornament and decorative motifs that a person was permitted to wear were restricted according to rank. During the Song dynasty it was decreed that only the emperor could use beds of red lacquer. Buildings with curved roofs were reserved for government buildings and homes of high-ranking officials. It was decreed by the Ming court, that “officers of the first grade to the third grade can build halls of seven bays, from the sixth to ninth grades, the beams can only be decorated with black color.” During the Qing dynasty, imperial sumptuary regulations stipulated that the houses of common people could not exceed three bays, or *jian*, houses of officials seven, temples nine, and palaces eleven. The status of the master was thus represented by the size and decoration of his house.

The courtyard house was the typical form used by the majority of the population and, according to archaeological evidence, existed as early as the Han dynasty (206 BC–220 AD). Walled courtyard houses encouraged families to live together as a family unit. In many areas of the country, common houses were arranged with a sleeping room to the left of the main room which was traditionally reserved for the parents. Children would sleep in a room on the opposite side. Such an ordering also recognized hierarchy, significance, and seniority which was further emphasized as additional rooms were added.

Courtyards and buildings were situated along an axially oriented pattern. Depth along a longitudinal axis in the courtyard houses of the wealthy also reflected a similar hierarchical pattern. The most public spaces were housed in the front including the kitchen, store rooms, and rooms for servants. Movement along the axis away from this common space was a passage to more private domains, with the last hall on the axis of the courtyard serving as the living quarters for the oldest generation, and those along the side halls for the children. A main reception hall was generally more highly decorated than the side halls, and functioned as a ceremonial hall for worshipping ancestors as well as for various seasonal ceremonies,

China: group of *huanghuali* furniture from the Woman's Quarters; from the exhibition *Masterpieces from the Museum of Classical Chinese Furniture*

weddings, or funerals. The courtyard was used primarily for circulation space between rooms and halls. Large estates also had enclosed gardens with water and rock gardens filling the space with life. Large trees provided shade, scent and fruit; decorated pavements and small pavilions accommodated outdoor spaces for the placement of tables and chairs and provided a refreshing atmosphere for relaxation, circulation and recreation.

Chinese architecture typically utilizes post and beam construction. After raising a foundation of rammed earth, a wood framework was erected usually consisting of an odd number of bays, or *jian*. The frame and roof trusses were joined with elaborate systems of wood joinery able to sustain the forces of common earthquakes. The adoption of the sweeping upcurved roof lines appears to have been an aesthetic preference which imparts an uplifting visual effect to lighten the mass of the large overhanging tiles roof; of course, the additional expense of such construction was only afforded by those of wealth and rank. The floors often remained earthen, or were overlaid with stone tile.

The spaces between the posts along the outside walls were generally filled with some variety of masonry on the back and sides, and narrow wood panels filled the spaces along the front. These modular panels were either solid wall panels, or served as window or doors. Open-work lattice windows, often detachable, let light and air into the rooms, and served a striking decorative purpose. The infinite variations of decorative lattice patterns were periodically re-covered on one side with a

semi-transparent oiled paper which could be purchased in the local markets. In more temperate regions, simple reed or bamboo curtains were hung between the supporting posts and rolled up during the day.

Large interior spaces were frequently divided with curtains, fixed partitions, or movable folding screens. The latter were often pasted with paper and painted with countless beautiful designs. In the Qing dynasty, precious treasure cabinets also were used as room dividers in the homes of wealthy. One side was flat and the other side fitted with many small and different sized shelves for the display of precious antiques and treasures. Sometimes they were made completely open so that the treasures could be appreciated both from front and back.

The diverse climatic and geographical conditions affected the architecture of buildings and their styles. In the cooler climate of northern China, where dust storms were also frequent, dropped ceilings were often added, to enclose the open roof space and maintain temperature, as well as to provide a shield from dust and dirt filtering in through the roof. Buildings in rainy areas tended to have large overhanging roofs. Those in high altitudes where rain was scarce were the opposite, with high stone walls and flat-topped buildings. In the northwestern regions of China, where rainfall is also scanty, and timber scarce, subterranean housing was common.

Because of the cold climate in northern China, the interiors of houses also generally incorporated a raised brick platform called a *kang*. These hollow platforms were often heated from the inside with fire, and, in larger estates, a series of *kangs* in

adjacent rooms were connected with a system of flues to a central furnace. The *kang* varied in size, from those of single bed size to large platforms which provided sufficient space for an entire family. These were not only slept upon, but used during the day as warm sitting platforms and arranged with low furniture such as *kang* tables and cabinets. Thus the early mat level culture did not entirely disappear, but is evidenced even in modern times as a continuation of a somewhat elevated mat level.

In the more temperate southern regions such as Jiangsu and Zhejiang, where the hot season was much longer than the cold season, the relationship of the interior to the exterior is less well defined. Walls of carved or lattice wooden window panels could be opened to outside terraces. Halls often had an open front, entered by a portico, with exquisitely carved woodwork. The colors were generally warm gray, with whitewashed walls. The woodwork was covered with a chestnut color or dark red or transparent paint. The general feeling was sedate and subtle, designed to create an intimate, pleasant environment for peaceful and harmonious family life.

In southern China, the rainy season is called the “mold rains” because of the propensity of household items to mildew during times of little sunlight and high humidity. Much more attention to ventilation was required, and few items could be stored directly on the cooler ground floor.

In Anhui province many two-storey houses dating from the Ming dynasty (1368–1644) are still found which formerly belonged to wealthy merchants. They are typically constructed with a light well that permits daylight to illuminate a small interior courtyard as well as the surrounding rooms that were fitted with latticework windows. The balustrades of Fang Wentai’s house are richly carved, and the curved profile forms a comfortable bench along the light well wall inside each of the surrounding rooms. The roofs of houses in this region were constructed so as to drain rain water into small pools at the center of the front interior courtyard, just inside the main door where guests enter the house. The tapered post and upcurved beam architecture is robust with spirit. The main members of the elaborately framed roof structures were shaped rounded and smooth, while the corbels and other secondary elements were crisply carved. Such *yinyang* balancing juxtapositions are frequently integrated throughout many aspects of the Chinese culture. The wood was once finished with oil to highlight the grain patterns.

Entering the household of a wealthy family, one might be greeted with a large horizontal sign in the frieze above the doorway with carved characters suggesting an auspicious wish or noble sentiment. During the Ming and Qing dynasties, the latticework of doors was so full of intricate patterns that the door was more a work of art than an article for daily use. Latticework panels often had various auspiciously-shaped openings or panels into which landscapes, or birds and flowers were painted, along with a short poem. Often precious hardwoods were used for these interior elements, including *huali*, *zitan*, *hongmu*, golden flecked *nanmu*, cassia, boxwood, cypress, fragrant fir, etc. The most highly prized latticework was inlaid with jade or enamel. Decorations in domestic houses and those of minority nationalities were also extremely rich in variety, boasting many ingenious creations using local materials and suited to local conditions.

Interiors might be similarly varied, but, throughout China, the central room of a dwelling has traditionally served ritual as well as secular purposes. It may be a simple room, or rather grand and lavishly decorated. The central room commonly has a high, long table placed against the back wall where ancestral tablets, images of gods and goddesses, and various ceremonial vessels and utensils are arranged. A large decorative painting flanked by a pair of vertical couplets was usually hung above the table. Periodic offerings of food and incense acknowledge patrilineal descent and communal links. Due to the high ceilings with exposed beams blackened by the burning of incense and dim lighting from the single entrance, these halls usually had a sobering atmosphere. However large the family and dwelling became, this room was accepted as joint property never to be divided. The room was multi-functional and served ceremonial purposes from birthday celebrations to funerals. In the late Ming period novel *Jin Ping Mei*, the great hall of Ximen’s residence was rearranged for a final tribute to his deceased wife with side tables set out as formal altar tables. During the Qing dynasty, a square table was customarily placed in front of the long side table with two chairs formally placed on either side. In the central room of more modest dwellings, and at meal time, the square table was brought forward into the central part of the room where chairs, stools, and benches were gathered around for seats.

In another episode from the novel *Jin Ping Mei*, Ximen gives a banquet for his friends and relatives; the scene is represented in an illustration. The large hall is set out with tables and large decorative screens facing one another. Candles on lamp stands illuminate the space for the evening’s entertainment. Modular square tables were often placed side by side to make up long banquet tables. On such formal occasions the tables were draped with brocade frontals and the chairs with chair covers. A less formal side of Chinese life occurred around the square “Eight Immortals” table. Because the Eight Immortals were known for their fun-loving joviality, the name has come to characterize the family entertainment – dining, playing games, chatting, drinking, etc. – that often occurred around the central square table.

In the homes of wealthy families, the kitchen was not central to the household and was staffed by servants. Meals were served wherever the master or the mistress of the household might fancy – in the bedroom, the study, or perhaps under a flowering tree in the garden. In the common dwellings of the general populace, however, the kitchen hearth was a central element in the home, as well as the dwelling of the kitchen god who watched over the family activities and reported annually to the heavenly emperor on their behavior. These stoves were generally fitted with a small shrine and decorated with auspicious imagery.

The idealized Chinese interior is most closely associated with the traditional scholar’s study, an example of which is represented in a woodblock illustration dating from the Kangxi period (1662–1722). The study reflects the Confucian ideal of a highly educated class of moral and virtuous officials well-versed in the classics, and expert in the four traditional arts of calligraphy, painting, poetry and music. A large painting table served as a desk and was central to the studio. In the 12th century, Guo Xi described a scholar preparing to write a poem or brush a painting: “On days when he was going to

China: canopy bed; woodblock illustration to the carpenters' manual, *Lu Ban Jing*, Ming dynasty

paint, he would seat himself at a clean table, by a bright window, burning incense to right and left. He would choose the finest brushes, the most exquisite ink, wash his hands, and clean the inkstone, as though he were expecting a visitor of rank. He waited till his mind was calm and undisturbed, and then began."

"A clean desk by a bright window" not only reflected an ideal relative to interior arrangements, but also the desired empty state of mind from which creative production can arise. The studio was often simply furnished. A footrest was placed below the table in front of the master's chair. Those with massaging rollers stimulated the circulation and excited the internal state for creative production. Elegant cabinets were filled with books, scroll paintings, and treasured writing utensils. A couch, or daybed, placed along a wall provided a place for quiet relaxation, as well as a platform to entertain a friend while playing enchanting music on the *qin*.

Footrests raised the feet away from the cool earthen or masonry floors; footrests fitted with warming brazier pans were also used during the cold seasons and, during the summer, footrests with cool stone panels provided some relief from the stifling heat. In southern China, with its milder winters,

portable braziers were commonly used to provide a localized source of heat. They also served as portable stoves for warming wine and preparing small delicacies. Low, bronze braziers, as well as brazier pans that fitted into low wooden stands were common; large, square ones were set out for special receptions or garden gatherings. Various charcoals were made of animal bone and dung. Fragrant flowers were added to refined charcoal blends and moulded into auspicious shapes that, when burned, perfumed the air and spread symbolic wishes.

The arrangement of the master's bedroom can be discerned in a painting by Qiu Ying of Master Zhang's bedroom from the well-known story *Dream of the Western Chamber* (*Xixiang ji*), as well as from the above mentioned jottings on elegant taste by the late Ming arbiter of taste, Wen Zhenheng. Concerning the master's bedroom, Wen notes: "Place the bed (*ta*) facing south. The half of the room behind the bed where people do not go should be used for such things as a brazier, clothes rack, washbasin, dressing case, and reading lamp. In front of the bed place only a small table with nothing on it, two small square stools, and a small cupboard containing incense, medicine, and delightful curiosities. The room should be refined, elegant, and not too cluttered. If too ornate, it will be like a ladies' room and unsuitable for a recluse sleeping in the clouds and dreaming of the moon."

Wen Zhenheng's passage provides an interesting juxtaposition with the furniture arranged in the ladies quarters which was generally provided as part of the dowry trousseau. Such furniture was considerably more ornate and decorated with traditional symbolic rebuses wishing for the newlywed bride to bear male children with the implied promise of sustaining the lineage and providing security and wealth for the future. Canopy beds were often carved with such auspicious decoration. The top rail of a late Ming dynasty *huanghuali* washbasin stand, formerly in the Museum of Classical Chinese Furniture, is crisply carved with *lingzhi* fungus and scrolling grass. The central panel is decorated with magnolia blossoms, symbolic of a beautiful woman, and the exposed seed pods represent fertility. Small jars of soap and cosmetics were placed upon its narrow, beaded shelf. A *huanghuali* towel rack in the same collection, dated to the 18th century, is decorated with an aquatic scene of mandarin ducks in a pond among lotus flowers in their various stages of development. Mandarin ducks, which mate for life, together with the lotus flowers, imply a wish for a long harmonious marriage with male offspring. A *huanghuali* mirror stand in the collection is decorated with plum blossoms which foretell of beauty rejuvenated with the arrival of springtime, and thus appropriate for a lady's cosmetic case.

The architectural canopy bed, enclosed with colorful brocade draperies hung from the inside, became a room within a room to provide privacy and warmth inside cold, drafty quarters. During the cold season, its enclosed space could also be used as a small room for dining, socializing, and other daily activities. Larger alcove beds additionally contained a small sitting area in front of the bed platform where a small table and stool might be placed. Such beds could be dismantled, so as to ease their installation and relocation. Similar beds were also built-in to the room structure during construction.

A poet of the Tang dynasty recommended that for a well planned residence, a sixth of the total area should be assigned

to the house, half to lakes and ponds, and a third to plantations of bamboo. In both the temperate seasons and temperate regions, these outside areas were equally used as living space as were the interior spaces. Decorative screens, tables, and chairs were commonly moved into the garden according to the occasion. During the hot summer evenings, gauze-lined enclosures arranged on the veranda furnished with a daybed, incense stand, stool, and side table served as comfortable sleeping quarters.

In summary, the Chinese “traditional interior” perhaps should be considered as a “traditional living space.” It was relatively flexible, and furnishings were grouped in accordance with the occasion as well as with the season. Although there were deeply rooted folk traditions among the common people who lived in simpler dwellings, the idealized concepts of “living spaces” really fall under a broader umbrella of “elegant living” defined by the ruling elite and the refined tastes of the literati. These tastes, or aesthetics, were based upon fundamental and dynamic principles of nature whereby beauty be blended with function, and simplicity be balanced with elegance.

As modern China races forward with a strong fascination towards the sciences, technologies and arts of the Western world, so the influences of Western architecture, furniture, interior design, and fashion will slowly become assimilated into Chinese culture. Presently, however, the state of interior design in China appears rather muddled to both a Western or a Chinese eye. However, like the previous Han and Tang periods when foreign influences have been highly fashionable, even greater artistic periods have flowered. Today China is once again in the process of rediscovery, and only the yet untold future will tell how the deeply rooted Chinese aesthetic will prevail.

Chinese Export Wares

Although the term “export wares” suggests a predominantly one-way trade, the truth is very different. Long before the 17th- and 18th-century European craze for all things Oriental, a flourishing trade was carried on between the Chinese and traders from the Near East, with the great trading port of Canton established and noted for its wealth. It is probable that the first examples of Chinese goods for export found their way to the West via these Near Eastern markets. Porcelain and lacquerwork items brought to Europe before 1600 were treated as rare and valuable objects, but cannot be said to have been a significant influence on the domestic interior.

This situation changed dramatically during the 17th century with the expansion of European trade. The Dutch East India Company (established 1597) imported large quantities of primarily blue and white porcelain; but despite the legacy of Chinese “manufactured” items such as ceramics, lacquerwork, and ivory, it was in raw materials such as tea and silk that the greatest trade was carried on. Until the mid 17th century porcelain exports from China were, with rare exceptions, indistinguishable from those wares designed for the domestic market.

During the first half of the 17th century the most popular type of porcelain to be exported was the blue and white Kraak, and it is arguably the first type to have been purchased in sufficient quantities to have had a definable influence on the contemporary interior. It is characterised by a thick glossy glaze particularly liable to chipping along any sharp edges on the pieces. The blue underglaze decoration is applied thinly, and so has a watery quality. Variety of decoration is enormous, but is noted for the surfaces of pieces being divided into panels containing individual scenes of birds, animals, or Chinese religious motifs. This ware was avidly collected by European royalty such as Mary II at Hampton Court, and by the Elector of Brandenburg at Oranienburg near Berlin. There is also evidence that the lesser nobility were equally interested. In Wycherley's play *The Country-Wife* (c.1675) Lady Fidget exclaims, “We women of quality never think we have china enough”.

During this period lacquerwork also became better known in Europe. The complex technique used the sap of the tree *Rhus verniciflua*. The earliest type to reach the West, known to the Chinese as *Kuan Cai* (“engraved polychrome”) and to the British as Bantam Work, involved coloured decoration previously engraved or carved in intaglio into a background layer of lacquer. Two screens in red lacquer given to Archduke Leopold

Chinese Export Wares: painted panel showing Chinese workshop with pots, screens and lacquer artefacts, late 18th century

of Austria by the Jesuit Fathers when he was elected Emperor in 1700 are examples of this process which also contain early signs of Western influence in their double-headed eagle decoration. The lacquerwork industry was strengthened by the closure of Japan (previously seen as the source of the best lacquerwork) to Western traders after 1639.

Later Kraak porcelain shows evidence of subjects designed specifically for Europe, such as decoration depicting tulips and other types of European flower. The quality of porcelain exported from China improved dramatically after 1650, with a heavier, thicker body than kraak. Blue and white porcelain continued to be shipped, the shapes borrowing from Chinese prototypes but adapted to suit Western tastes. Examples include garnitures of vases catering to the European fashion for matching sets of mantelpiece ornaments, and large vases to be displayed on the floor or, as at Dyrham Park, Gloucestershire (1710 inventory), in fireplaces during the summer.

By the early years of the 18th century a slow decline in the popularity of blue and white porcelain had begun. Fascination with Japanese culture sponsored a fashion for so-called *Imari* ware decorated in both underglaze and overglaze colours, and often lavishly gilded. The closed Japanese market once again favoured the Chinese, Chinese *Imari* being a significant export during the early 18th century.

During this period enamelled wares became more prominent in their influence on the Western interior. These wares were decorated in the predominantly green *famille verte* enamels from the first decade of the 18th century, whilst the *famille rose* was introduced from the 1730s.

The new colours were used for new forms. Birds, dogs, and lions as well as human figures were exported in pairs as decoration for European cabinets and mantelpieces, as well as a huge variety of more or less utilitarian items such as cups, mugs, and teapots.

The passion for collecting porcelain soon began to exhaust the space available on mantelpieces however, and we know that as early as 1708 the modestly wealthy Squire Blundell of Lancashire was ordering furniture having "steps" for the display of his china. The supply of furniture designed to display china became quite an industry in itself during the 18th century; Thomas Chippendale for example illustrating examples in his *Director* of 1762 (3rd edition).

The lacquer industry also prospered through the adoption of new techniques. The process of *Kuan Cai* was superseded during the 18th century by painted lacquerwork and the familiar gold-on-black style of decoration more suited to bulk production of both furniture and smaller decorative items such as boxes, screens, and fans. Imported lacquerwork screens were mounted in ormolu to form larger pieces of furniture, or used as wall panels, as in the case of the china closet built for Mary (later Queen Mary II of England) at Honselaardijk, Holland in 1686.

By the mid 18th century the growth in demand for porcelain made to special order was becoming a significant aspect of trade. Pieces from the early years of the 18th century are usually only distinguishable as "special" by the addition of coats of arms, or small details in the form of decorative cartouches, most often applied underglaze in cobalt blue; but

the trade in armorial porcelain developed very rapidly. For much of the century the great families of Europe and America were supplied with often lavish porcelain decorated with personal arms. This trend was aided by the increased palette of colours available to the Chinese potter; a fine example is the exquisite service created for Leake Okeover during the 1740's, the polychrome onglaze enamel design covering virtually the entire surface of the ware.

Blank pieces were also decorated to local taste in Europe, and there is evidence that the East India companies periodically employed artists (most famously Cornelis Pronk) to develop designs. Much more common, however, was the use of well-known engravings by leading artists and caricaturists. These were sent East to be used by the Chinese potters. Subject matter ranged from satirical themes to gently erotic scenes for private consumption. Dinner ware and other items for societies, guilds, and companies were also made to special order, such as the large blue and white service ordered from Canton by the Mutual Assurance Company of Philadelphia in 1812. The service was used for dinners following meetings of the Board of Directors.

Chinese ceramics made for export during the last half of the 18th century presage a sharp decline in the popularity of the ware. A reliance on designs "borrowed" or adapted from those of European manufacturers (particularly porcelain factories) is noticeable. The figure groups and dinner pieces of Meissen, Sèvres, Strasbourg, and Chelsea were all copied. It is ironic that Chinese potters found themselves decorating pieces with designs reflecting a European pastiche of their own culture. This trend continued into the 19th century, for example with the ordering of massive porcelain pagodas to complement the decoration of the Royal Pavilion in Brighton.

During the late 19th century, the Aesthetic Movement encouraged a revival in all things oriental which once again led to large-scale exports, with retailing firms in Europe like Liberty's specialising in the trade. Large scale "Mandarin" vases were imported to complement (even dominate) the domestic interior, while the smaller "Ginger jars" decorated in underglaze blue and white frequently fetched very high prices.

Chinoiserie

Chinoiserie is a wholly European style whose inspiration is entirely oriental. True Chinoiseries are not pallid or incompetent imitations of Chinese objects. They are the tangible and solid realizations in the West of "Cathay", an imagined land, created over the centuries by travellers' tales and by careful scrutiny of its inimitable products of embroidered silk, lacquer screens and porcelain bowls, carried to Europe by the East India trade. The craze for the orient and all things Chinese that gripped Europe in the second half of the 17th century incorporated these exotic treasures into the Baroque decorative schemes then fashionable in the West. Porcelain vases were displayed in a quite un-Eastern fashion, towering and clustering on cabinets and chimneypieces, or mounted in silver or ormolu. The glowing hues of the embroidery were hung on bedsteads which rose to the height of the ceiling, and were capped with great plumes of feathers, while at Versailles, where Louis XIV collected oriental works on a vast scale, the glitter of lacquer replaced the silver furniture melted down to finance the king's disastrous wars. Under Louis XIV, Versailles became the arbiter of fashion for all Europe. There Chinoiserie was given the royal imprimatur, and from there it spread as a court style to Germany, and from Germany to Scandinavia, Russia, and the rest of Europe. A more fantastic and playful view of China – also present in mainland Europe's Chinoiserie images – added a sense of whimsical eccentricity to the style in England.

Seventeenth-century interiors throughout Europe were sparsely furnished. Furniture needed to make an impact, and lacquer – whether imported from the East, or "japanned" by local craftsmen, who attempted to emulate the lacquer-makers' art using home-grown ingredients – was highly favoured. The method was minutely described in *A Treatise of Japanning and Varnishing* (1688) by John Stalker and George Parker, and japanning became a fashionable pastime with English ladies who japanned anything, even walnut furniture. In Germany, two of the finest japanners of the 17th century, Gerhard Dagly and Maximilian Schnell, produced furniture and bibelots of outstanding worth, while Dutch lacquer copies were of such high quality that they were easily mistaken for the real thing.

Chinoiserie: *grande singerie*, Chantilly, by Christophe Huet, 1735

Imported lacquer screens were cut up to line the walls of small dressing rooms and closets, often used for the new diversion of taking tea. The earliest surviving example of a *lackcabinett* (c.1660) is at Rosenborg Castle, Copenhagen. In England, Burghley, Chatsworth and Hampton Court all had lacquer rooms before the century was out. Baroque-style lacquer rooms were found in Germany (Chinesische Zimmer, Neue Residenz, Bamberg, 1705), while the Baroque Indianisches Lustschloss (Pillnitz, c.1720) and a Japanisches Palais (Dresden, c.1715) show the confusion of names typical of the geographical indifference and topological uncertainty that underpinned Chinoiserie.

Seventeenth-century pottery throughout Europe strove to emulate the porcelain imported from China. Dutch pre-eminence was marked in the Delft potteries, which mimicked the blue-and-white Ming colours but on new Baroque forms – pagoda-shaped tulip stands, lobed dishes, sets of vases – and with new decoration too, moving from Chinese designs to pure Chinoiserie scenes, often taken from engravers' manuals or illustrations in travel books. In France, Rouen produced polychrome dishes decorated with Chinoiserie subjects, while at Nevers Chinese ornament was applied to both Baroque and Chinese shapes, albeit with an air of French orderliness completely lacking in the originals. English Delftware was manufactured at Lambeth and Bristol in the 1680s, while at Fulham John Dwight was granted a patent in 1672 for the manufacture of "transparent earthenware commonly known by the name of Porcelaine or China." Between about 1670 and 1685 engraved Chinoiserie motifs were popular on English silver, and from the mid-century imitative designs by English needle-workers, in the Chinese manner or "after the Indian fashion", made their appearance on the counterpanes and curtains of the Stuart household. Chinoiserie tapestries were woven in Soho c.1700, while in France both Gobelins and Beauvais produced notable suites of Chinoiserie tapestries in the 18th century.

In the first decades of the 18th century artists and designers found that Chinoiserie's clear, bright colours, amusing and fantastic motifs, and asymmetric design were all shared by the new Rococo style, and combined these with purely European Rococo motifs, often in the same work. The result was so felicitous and so popular that it became one of the Rococo's most notable features. The few Chinoiseries produced by Antoine Watteau set the course for Rococo Chinoiserie throughout Europe. His decorative scheme for the Cabinet du Roi, Château de la Muette, (c.1718) presented a distinctly Gallic and frivolous view of Chinese life. The ironic tone struck by Watteau was taken further by Christophe Huet when he produced a Chinoiserie *singerie* of Watteau's scene in the *grande singerie* at Chantilly (1735). About 1748, Huet decorated the salon chinois and the boudoir at the Château de Champs with a series of vignettes of Chinese and exotic birds for Madame de Pompadour. Madame de Pompadour's Château at Bellevue was decorated by François Boucher, who infused his highly individual Chinoiserie style with the sensuality common to all his work. At Bellevue he devised a Chinese boudoir and painted two *paysages chinois* for the drawing room. As Boucher's influence spread across Europe his painting *A Chinese Fishing Party* became a favourite theme for Chinoiserie designers, and little Chinese figures fishing under a

willow tree ornamented the luxurious trinkets of the rich. From 1740, many suites of Boucher's Chinoiserie engravings were issued. All were widely copied and adapted, used for statuettes in bronze and terracotta, gold and enamel snuff-boxes, overdoors and painted panels, and designs on porcelain in factories from Meissen to Lowestoft.

The last great French designer of Rococo Chinoiseries, Jean-Baptiste Pillement, worked in practically every major city in Europe, from London to Warsaw, designing with equal facility and *joie de vivre* a Chinoiserie study for the king of Poland, a pavilion at Cintra in Portugal, floral designs for silks and cottons, and hundreds of designs for enchanting "Chinese ornaments" complete with bells, dragons, birds, monkeys, shells, and Chinamen wearing upside-down flowers instead of hats. These were engraved and translated into fields as various as marquetry, textiles, tiles, wallpapers and room decoration. Between about 1755 and 1760, Pillement prints were published in London as well as in Paris, and up to 1774 he continued to produce prints of Rococo Chinoiseries in large numbers.

Painted Chinoiserie rooms remained fashionable up to the 1770s. Costly alternatives used satins and embroideries from India and painted silks from China to line the walls. From 1750 toile de Jouy, a cotton fabric decorated with engraved copperplates of little vignetted scenes, often Pillementesque Chinoiseries, was extensively used, not only to line the walls, but also to cover chairs and beds. Few of these rooms have survived, although examples of the fabrics are preserved in textile collections, and textile companies today have reissued document prints of the 18th-century designs. Wallpapers filled any gap caused by the huge demand for printed cottons, and by 1750 boldly-drawn and brightly-coloured Chinoiserie papers were fashionable. Lacquer reflected the mid-18th century taste for pure colours with red and polychrome lacquers generally preferred to black. *Vernis Martin*, a French version of lacquer, was produced in response to the demand for colour in furniture and decoration. By the 1760s a more severe Neo-Classical style was in fashion and Japanese lacquer was favoured above all others as colours grew more restrained and black and gold returned to fashion.

The wild enthusiasm for Chinoiserie encountered north of the Rhine contrasted with the restrained Frenchification of the style that ruled in France. The German princelings were passionate Sino-philes, and their family connections throughout Europe ensured the spread of the style. Frederick the Great's most notable essay in architectural Chinoiserie, the Chinese Tea House (Potsdam, 1757) is much more fantastic than its Gallic equivalent. Its cupola is topped by a gilded Chinese figure holding an umbrella, while life-size gilded sandstone Chinese musicians are placed on its veranda. In Sweden, the Queen, one of Frederick's sisters, was given an entire Chinese pavilion as a birthday present: Kina – China – whose exquisite interiors embody a mixture of European Chinoiserie designers, the French represented by Boucher and Watteau, the English by William Halfpenny and William Chambers. Another of Frederick's sisters, the Margravine of Bayreuth, built a summer palace, Schloss Eremitage, which had a Chinese kiosk in the garden, drawing rooms decorated with *singeries*, butterflies, Chinamen, and flowers, and a mirror room. The Amalienburg Pavilion (Nymphenburg) has Chinoiserie scenes in blue and

Chinoiserie: state bedroom, Nostell Priory, by Thomas Chippendale, c.1750

white in three of its rooms, the Hundekammer, the Retirade and the kitchen.

Chinoiserie interiors were considered sublimely appropriate to house and display the collections of oriental porcelain that every German princeling was amassing. A few such *porzellan zimmers* survived until World War II. The earliest and most noticeable (Schloss Charlottenburg, outside Berlin) has been restored. True porcelain was first produced at Meissen c.1710 and spread from there across Europe. Chinoiseries formed an important part of the porcelain decoration of all factories, whether in blue and white, polychrome enamels, or gold-leaf. Most of Meissen's useful ware was decorated with the so-called *Indianisches blumen*, emphatically-coloured, fancifully-drawn flowers deriving from the peonies and chrysanthemums first seen on the Chinese *famille vert* and *famille rose* wares imported to Europe.

The fretwork, bells and dragons of Cathay made an early appearance in Russia. Monplaisir, Peter the Great's summer palace in the grounds of Peterhof Palace, had a scarlet lacquer cabinet, since restored, with gilt Chinoiserie scenes and brackets holding porcelain. Catherine the Great's so-called Chinese Palace at Oranienbaum (1762) has an *enfilade* of state rooms with a number of Rococo Chinoiserie interiors: painted, lined with silk, decorated with beads, and inlaid with wood. A complete Chinese village erected in the grounds of Tsarskoe

Selo is a rare survivor of a vogue for Chinoiserie garden follies that spread from England to every country in Europe.

Italy had early embraced Chinoiserie. Venetian lacquer, known and admired in the 17th century, reached its apogee in the 18th, and is still produced today. Early 18th-century lacquer designs were directly inspired by the Far East, with red or black ground colours decorated in gold with an assortment of exotic subjects. Some notable lacquer rooms (Palazzo Reale, Turin c.1725) follow the model found elsewhere in Europe, while the native style of fresco decoration extended its subject matter to include Chinoiseries too (Villa la Barbariga, Stra). At the Villa Valmarana, Vicenza, decorated by G.D. Tiepolo (c.1757), the Foresteria is frescoed with large Chinese scenes given a particularly Venetian quality of richness and lightness. Further south, the king and queen of Naples created a porcelain room at their royal palace at Portici (c.1757), featuring groups of brightly enamelled porcelain Chinamen in high relief. The entire decorative scheme was repeated at the king's palace at Aranjuez, Spain. In Sicily, the Villa la Favorita, also known as the Palazzina Cinese, has fresco decoration in a Pompeian Chinoiserie style, where richly attired mandarins and pagoda-roofed fretted pavilions replace the Roman temples and classical maidens of the Pompeian style.

In England, Chinoiserie decoration, largely suppressed in the early 18th century by the emphatic and narrow dictates of the Burlington school, was liberated by the Rococo. But unlike

France, where Chinoiserie had been seamlessly absorbed into the sophisticated body of the Rococo style, in England it was a quite independent element, a wild and frivolous changeling of the parent style. This was due to another key difference: patronage. Rococo Chinoiserie in England was not the exclusive plaything of the rich and well-born. It was the compilers of pattern books and carvers who were responsible for the vitality of English Chinoiserie and for its wild popularity in the 1750s. By 1765 the craze was on the wane, although the new style, Neo-Classicism, did not eclipse it entirely. Both Robert Adam and William Chambers produced refined Chinoiserie designs and used the style for interiors. Chambers's *Designs of Chinese Buildings, Furniture, Dresses, etc.* (1757) was considered the most authentic of the pattern books of Chinoiserie designs that appeared in the 1750s. The first was *New Designs for Chinese Temples, Triumphal Arches, Garden Seats, Palings etc.* by William Halfpenny, quickly followed by his *Rural Architecture in the Chinese Taste* (1752), a year that also saw the first pattern book devoted to Chinoiserie designs for interiors, Matthias Lock and Henry Copland's *A New Book of Ornaments in the Chinese Taste* (1752). This was followed by *A New Book of Chinese Designs Calculated to Improve the Present Taste* (1754) by Matthias Darly and George Edwards.

Here were designs for furniture, chimney furniture, vases and stands, as well as illustrations of landscapes and ornaments useful for japanners, porcelain painters, and embroiderers. These designs appeared on printed cotton and on Bow porcelain, and some were reprinted in 1762 in *The Ladies Amusement, or the whole art of Japanning made easy* by Robert Sayer. Darly's and Edwards's designs were also appropriated in *Chinese Architecture* (Paul Decker, 1769). The best known patternbook, Thomas Chippendale's *Gentleman and Cabinet-Maker's Director* (1754), included designs for "Chinese Chippendale" furniture. This not only has decidedly "Chinese" ornamentation of pagoda cresting or pierced and fretted galleries. Its shape is different with a square and angular outline and straight legs. Most furniture made in the Chinese taste was of mahogany, a wood that took carved decoration extremely well, but the large frames of looking-glasses were generally of soft wood, mostly gilded, occasionally japanned.

By 1750 a Chinese bedroom and dressing room was considered the height of fashion. The most famous, decorated c.1753 at Badminton House for the 4th Duke of Beaufort, by John Linnell, had a suite of japanned furniture: eight chairs, two knee-hole dressing tables, probably two mirrors, a commode and two pairs of standing shelves, apart from its glory, the bed.

Chinoiserie: engraving from *A Collection of Designs for Household Furniture* by George Smith, 1808

Square in shape, japanned in scarlet, canopied by a black and gold pagoda roof, hung with bells and ornamented with dragons, this spectacular bed has a latticed headboard as high as the top of its posts. Perhaps the most brilliant ensemble of Chinoiserie japanned furniture still in place is at Nostell Priory, Yorkshire, where Chippendale decorated the state bedroom and dressing room, and two adjoining closets. Chinese bedrooms were generally lined either with printed linen or wallpaper. The cost of imported Chinese wallpapers encouraged the production of local versions, inspiring patterns still produced. Some country houses in England still have rooms hung with mid-18th century "Indian paper", Saltram House, Devon, being a notable example.

The more extravagant and inventive path of English Chinoiserie Rococo is exemplified at Claydon House, Buckinghamshire, where great carved ho-ho birds perch on the cresting of the classical doorcases, fabulous cranes roost, and winged dragons swish their barbed tails. The so-called Chinese room on the first floor has an entire wall devoted to an astonishing tea-alcove, a realisation in three dimensions of the airy fancies seen on porcelain or lacquer, a kind of pagoda-pavilion carved in wood and painted a glistening white, where among the bursting flowers, shells, scrolls, bells and diaper-work, a miniature Chinese family sits round a tea-table, each raising a carved arm in stiff salute, while on the table the meticulously carved tea equipage waits. Luke Lightfoot, a little known carver of genius, is responsible for these, the most extraordinary Chinoiseries in England.

The techniques of Chinoiserie decoration were attempted in America as soon as they had been tested in Europe. From the 1760s Chinoiseries appeared on copper-plated printed textiles and wallpapers, while the James Reid House, Charleston (1757) and Gunston Hall, Fairfax County, Virginia (1758), boasted Chinoiserie interiors contemporary with their equivalents in England.

George IV was England's greatest devotee of Chinoiserie in the 19th century and the design of the Chinese drawing-room (c.1790) at Carlton House, his London house, was seen as the paragon of Georgian Chinoiserie taste. Its architect, Henry Holland, had re-imported Sir William Chambers's "Chinese design" to England from France, where it had been sharpened with Gallic sophistication and good breeding. But it was a combination of opulence with a kind of barbaric splendour that dominated the furnishings of that most extraordinary of Chinoiserie palaces, the Royal Pavilion at Brighton. Its first decoration, c.1801, by the firm of Frederick Crace, was in the established tradition of Chinoiserie taste. Delicate, light and fanciful bamboo, fretwork, and *treillage* were combined with sophisticated ground colours, like scarlet and purple, to provide a scheme that was gay, light-hearted and rather old-fashioned in its air of Rococo charm. In 1815 the interiors were remodelled, and a more powerful, bizarre but disciplined richness replaced the tinsel and toylike brilliance of the first style. Scaly dragons and metallic snakes, lotus-shaped gasoliers, gilded palm-tree pilasters, combined with rich colours and grand furniture to produce an astonishing and exhilarating effect. By this stage the Crace firm's knowledge of Chinoiserie was augmented by the work of Robert Jones, who was responsible for many of the designs. The dramatic finale of the decorative scheme, the Music Room, represents the

summit of the Crace firm's achievement. Blazing with crimson and gold Chinese landscape murals framed by gigantic serpents and winged dragons, it is like a huge lacquer box lit by water-lily and dragon-shaped gasoliers.

The Prince Regent's championing of Chinoiserie was in the old style of court art, and he collected only the finest examples. But new industrial techniques of mass production made for a wider participation in the taste. Transfer-printed Chinese-style designs on tableware, especially blue and white, were cheap and popular by the 1830s. A favourite was the Willow Pattern, developed about 1795 by Josiah Spode. The 19th century Rococo revival introduced mass-produced Chinoiserie motifs onto wallpaper, textiles and furniture. About 1870, the Queen Anne revival returned lacquer and japanned cabinets and bureaux, Delft and Nanking China to fashion.

Chinoiserie's most notable achievements in the 20th century are in places of public amusement, where its sense of opulence and fantasy can be given unbridled rein. Public parks, music halls, theatres, cinemas and hotels, even cruise liners, have all embraced the style. The Grand Theatre, Clapham (designed by E. A. Woodrow c.1900, recently restored) has a Baroque exterior and a Chinese interior, complete with dragons, and boxes shaped like pagodas. But it was the cinema, of which Grauman's Chinese Theatre in Hollywood itself is perhaps the most conspicuous example, that gave Chinoiserie new life in the 20th century. Chinoiserie was employed by cinema designers from La Pagode in the rue Babylone, Paris, to the Palace, Southall, West London, while in Seattle, Washington, the 2,400-seater cinema, the 5th Avenue, is a grand example of the subverted authenticity that has always provided Chinoiserie with its richest soil.

Principal Collections

Important Chinoiserie interiors survive in many European houses and collections. French examples include: the Salon Chinois, Château de Champs, Champs-sur-Marne; La Grande Singerie, Musée Condé, Chantilly; and Le Salon Pillement, Château de Crâon, Haroué, near Nancy. German examples include: Schloss Favorite, Baden Baden; the Chinese Room, Neue Residenz, Bamberg; Schloss Charlottenburg, Berlin; the Amalienburg and Pagodenburg Pavilions, Schloss Nymphenburg, Munich; and the Chinese Tea House, Sans Souci, Potsdam. British examples include: the Chinese Room, Claydon House, Buckinghamshire; the Chinese Rooms, Saltram, Devon; the Royal Pavilion, Brighton, Sussex; and the State Bedchamber and Dressing Room, Nostell Priory, Yorkshire. Italian examples include the Palazzina Cinese (Villa Favorita), Palermo, Sicily; the Porcelain Room, Museo e Gallerie Nazionali de Capodimonte, Naples; and the Lacquer or Chinese Room, Palazzo Reale, Turin. Russian examples include the Chinese Palace (now China Palace Museum), Tsarskoe Selo, near St. Petersburg. Scandinavian examples include the Kina Slott (Chinese Pavilion), Drottningholm, Sweden.

Chintz

Strictly speaking chintz is a type of painted or printed cotton. It differs from printed calico (a far humbler fabric) in that it is finer in quality, firmer and more tightly woven, sometimes with a glazed finish. It boasts multivarious designs and has been used for soft furnishings, bedcovers and hangings, and curtains. And it has occasionally been used for clothes.

Chintz is not only a type of fabric, the term has also come to be identified with a particular style of interior design. "Chintz!", wrote Frank Lewis in his early history of the subject published in 1935, "What a pleasant sounding name – what pleasant thoughts it brings to the mind – the old country cottage with its old grandfather clock, the burnished copper warming pan, and those gaily coloured chintz curtains. The country house with its bright chintz covers, so reminiscent of home and all it means. Truly, chintz may be said to represent

the feeling of the Englishman and his home, as it really is." Lewis's words highlight the association that has developed between chintz and Englishness, particularly in the world of interior design. This association is, if anything, even stronger today and has contributed greatly to the international popularity of traditional floral patterns produced by firms such as Arthur Sanderson & Sons, Colefax and Fowler, and Laura Ashley.

Chintz first arrived in western Europe from India, and although many of the early designs suggest Persian influences, it is considered to be of Indian origin. The name has Hindi roots and stems from the word *Chitte* or *Chit* which means speckled or painted cloth. During the 16th, 17th and 18th centuries, the designs in the better kind of Indian chintzes were often painted; other varieties included painted areas within block-printed outlines, and printed patterns.

The early European traders in the East used the brightly coloured cloths as barter to obtain spices from the Malay peninsula. The earliest evidence for their use in Europe dates from the 1570s and 1580s when they are mentioned in the wills of wealthy citizens living in Marseilles. These particular samples were brought by the overland route but almost simultaneously other consignments were reaching Lisbon and Amsterdam by sea. The first examples arrived in England as booty in captured ships. An important cargo aboard the Portuguese *Madre di Dios*, including *chittes*, calicoes, lawns, quilts and carpets, was captured by a British privateer in 1592 and brought to Devonport. The interest and enthusiasm generated by these cloths (also known as "pintados" after the Portuguese word meaning speckled cloth) encouraged the establishment of the British East India Company in 1600.

Initially chintzes or "pintados" employed native Indian styles. But as the commercial possibilities became more evident, trading companies began to commission special designs to suit European taste. The Mughal Emperor Akbar introduced craftsmen from Turkey, Persia, China and Italy to instruct his workmen, and in 1669 the English East India Company began sending actual patterns for Indian cotton-painters to copy. Many of these patterns were floral and included both tree and branchwork designs as well as all-over floral repeats. Other designs were copies or adaptations of European models, including the work of established designers such as Jean Berain. But craftsmen rarely produced exact replicas of the designs that they were shown. Instead they produced their own interpretations which resulted in the beautiful and exotic stylisations of flora and fauna that have proved so appealing to European tastes.

The attractions of chintz were manifold. Previously, the only fabrics available were linen, hemp, silk and wool, all of which were heavy and expensive. Also, the colours in these fabrics tended to fade with age, or lost their brilliance when washed. Chintzes, by contrast, were bright and fresh, reasonably priced and light in weight. They offered an alternative furnishing fabric that was attractive, hardwearing and washable, and, for the first time, beautiful textiles were no longer the prerogative of the very rich.

Demand for such goods soon became overwhelming, especially in England and France. Originally, they were regarded as an exotic curiosity but by the 1680s they had become widely admired and sought after commodities. Not surprisingly, there

were many European printed imitations. In 1648, Benoit Ganteume, a master playing-card maker, together with Jacques Bavilles, a master engraver, set up the first cotton printing company in France. Others quickly followed and when Marseilles became a free port in 1669, the first Provençal prints were produced.

The rapidly increasing popularity of chintz and other printed cottons posed a growing threat to the established textile industries – especially silk – and numerous restrictions on imported and locally-produced goods imposed in France between 1686 and 1759 sought to protect native industries and restrict the supply of foreign work. These included the banning of all cotton imports in 1691, and subsequent bans of chintz in 1720 and 1734. Nevertheless, chintz still managed to find its way into France and, if anything, the bans served only to heighten demand and strengthen its appeal. Highly placed leaders of fashion openly defied the 1691 decree. The Marquise de Pompadour, for example, commissioned a portrait from Hubert Drouais in which she is shown wearing a dress made of chintz. She also made a particular point of decorating her Bellevue château with chintz and made gifts of it to her friends. The less privileged had to be more clandestine and punishments for breaking the law were severe, ranging from fines and imprisonment to years in the galleys and even death. Even so, people of high rank continued to acquire chintz through smuggling and to use it in their homes.

British consumers were just as enamoured of chintz as their French counterparts. In 1663, the fashion-conscious Samuel Pepys recorded: “After many tryells bought my wife a Chintze; that is a paynted Indian calico for her to line her new study, which is very pretty.” The early British imitations were very poor quality and so initially posed no threat to other textile producers. Increasingly, however, silk weavers were affected not only by the falling-off in popularity of their products but also by the arrival of an influx of Huguenot weavers fleeing France after the 1685 revocation of the Edict of Nantes. After much agitation an Act of 1701 forbade the use of printed cottons. Successive legislation imposed yet more restrictions and fines, and a total ban on the use of printed cottons for clothes or furnishings was not relaxed until 1774 when the use of cottons manufactured in Britain was allowed. As in France, however, chintz was still much sought after and quite large quantities were smuggled in from Holland.

The first chintzes sent to America came from Britain and were favourably received. Fashionable and influential figures, such as Thomas Jefferson and Governor Penn of Philadelphia, who had spent time in Europe, brought samples back with them initiating a vogue for chintz hangings and upholstery. After the Revolution, however, British fabrics were boycotted. This created an opening for French suppliers who stepped in to meet the growing American demand for gaily coloured printed cottons.

The 18th century was the heyday of chintz in Europe, witnessing not only the production of many beautiful designs but also the emergence of cotton as an important furnishing fabric. “Pintados” and imported cloths were frequently used as wall and bedhangings as well as on furniture. A bedroom in the Château Borély, Marseilles, contains wallcoverings made from Indian flowering-tree bedspreads that were installed between 1775 and 1780, while two other rooms are hung with

chintz yardage, the design consisting of small sprigs and treelets. The fabric was set into panelled walls and secured with beading. Interiors entirely furnished with chintz were also very popular in England, particularly in bedrooms, the best-known surviving examples being the hangings made for the “Garrick Bed” now in the Victoria and Albert Museum. These chintzes were sent from India in 1774 as a gift to the wife of the actor, David Garrick, and includes two pairs of curtains and valances featuring designs based on the flowering tree. Numerous quilts and palampores, often designed to match sets of hangings or curtains, were also imported during this period. Some of these were also used as covers for furniture, such as tables, stools and cupboards.

A major figure in the development of European chintz was Christophe-Philippe Oberkampf who established a printing works and a cotton spinning and weaving mill at Jouy-en-Josas, near Versailles, in 1760. In addition to their celebrated Toile de Jouy fabrics, the factory produced numerous Indian-style floral patterns of very high quality which were greatly admired and used in many wealthy French interiors. Robert Hendry, a Scottish colour maker and engraver, spent considerable time at Jouy and brought the secrets of their dying and manufacturing processes to Britain. The popularity of chintz patterns during the Georgian period is evident from the many designs used for both wallpapers and textiles, although they tended to be used for informal areas such as small sitting rooms, cabinets and bedrooms.

The revival of interest in early 19th century designs that occurred in the late Victorian period was spearheaded by William Morris whose earliest printed textiles were copies of traditional floral patterns. The delicate colouring and stylized naturalism of these patterns contrasted sharply with the acidic hues and overtly realistic appearance of mid- and high-Victorian commercial textile designs. Morris himself went on to develop his own distinctive style, derived both from nature and from historic designs, and his printed textiles were eagerly sought after in “artistic” Arts and Crafts homes. A taste for more traditional chintz designs re-emerged in the mid-20th century when it was closely associated with the English Country House style. This style was developed by the decorating firm Colefax and Fowler who pioneered the use of period colours and patterns in interiors that were intended to evoke the grace, elegance and comfort of the Georgian period. They reproduced many historic textiles and their use of glazed floral chintzes has become one of the company’s hallmarks.

Today, chintz can refer both to a style – rustic 18th and early 19th century English – and to printed cottons. Up-market producers of chintz fabrics include G.P. & J. Baker, Osborne & Little, and Jane Churchill. In the work of firms such as Laura Ashley, Sandersons, Liberty and John Lewis, the style has gained even broader appeal and chintz lines are often marketed with matching or co-ordinating wallpapers. In France, Boussac and Manuel Canovas both design and produce fine chintz fabric, while in the United States one of the major chintz producers is Brunswick & Fils. Expensive, hand-blocked designs are still made and demand outstrips supply.

Chippendale, Thomas 1718–1779

British designer and upholsterer

Thomas Chippendale is indisputably the most famous cabinet-maker ever to have emerged from Britain. His reputation is international, and during the 19th century, so overwhelming that admiration for the joiner's son from Otley in Yorkshire grew into an adulatory cult which seemed to ignore the existence of any other contemporary British cabinet-maker. Chippendale was certainly one of the leading cabinet-makers of the time but his apparent pre-eminence is due to his publication in 1754 of *The Gentleman and Cabinet Maker's Directory*. This collection of 161 folio plates engraved largely by Matthias Darly and a small number by T. and J.S. Müller of Chippendale's furniture designs, was instrumental in finally disseminating the Rococo style throughout Britain, a country which had adopted the Continental style unwillingly and slowly a century after the rest of Europe. Furniture designs, although available in Europe for the previous 200 years, had never been published on such a scale before, and, as a consequence, Chippendale emerged from relative obscurity to become the best-known cabinet-maker of his day.

Although Chippendale would have received a traditional and thorough training as a cabinet-maker, it is unlikely that he would have worked at the bench himself after the business

moved to St. Martin's Lane in 1754. The firm employed up to 50 skilled men and his contribution would have been to direct them, monitor the quality of their work and above all design for them. Designs from the *Director* were disseminated throughout Britain, with provincial cabinet-makers using it as a sourcebook either for a complete design or for various elements to be used in their own output. It was twice reissued by Chippendale, with the final third edition containing 200 plates. When the Third Edition was advertised in 1763, a French version entitled *Guide de Tapissier, De L'Ebéniste* was offered "for the convenience of Foreigners". Whilst extremely rare, copies of the book have been traced to contemporary collections in France, Germany and one in the Imperial Russian Library, suggesting some influence in Russian court furniture.

The *Director* continues to be reprinted to this day, not just as an academic exercise, but as a reference book for practising cabinet-makers. The notes to the plates and the scale measurements mean that the designs can be used as the basis for working drawings, and technical advice on setting out the work, mitring and methods of construction show Chippendale's awareness of how a working cabinet maker would use the book.

The trade card of Chippendale and Rannie read "Cabinet-maker and Upholsterers" and the upholstery side encompassed a far wider range of commercial activity than would be considered normal today for such a trade. In 1747, Robert Campbell's *London Tradesman* described a typical Upholster as having "not only Judgement in the Materials, but Taste in the Fashions ... Skill in the Workmanship ... and set up as a Connoisseur in every Article that belongs to a house".

In addition to the business of designing and making furniture, Chippendale's accounts list a number of services provided to his clients: he was responsible for hanging paper in patrons' houses and colouring on site. Sir Edmund Knatchbull complained "As to the Man who putt up & colourd the Green Paper he was not above two days at work & did it extreemly bad" (Mersham correspondence, January 1771). Chippendale also assumed the responsibilities of an interior decorator in that he counselled his clients on the appropriateness of their decisions. Lady Knatchbull was advised to install in her dressing room "Large Berjairs as We think it would be of propriety in one room". The firm continued to advise in the time of Chippendale the Younger when asked by Ninian Homes as to whether the ceiling of his drawing room should be white or "painted in different colours", what sort of wallpaper to hang saying "I leave you to choose the paper since you are a better judge of what is proper for such a room".

Actually decorating the rooms was not something that the firm undertook. Responsibility for such things rested traditionally with other tradesmen, and when Chippendale did send a painter, such as at Harewood and Nostell Priory, "Brewer the Painter" spent his time colouring wallpaper. A number of houses had cartridge paper hung by Chippendale's workmen which they then coloured by hand. The colouring was either in stripes or in an all-over wash and was popular since it avoided the tax levied on manufactured papers. The same blue colour, known as "verditer" was popular both as a wall covering and as a pasted lining paper for drawers, although Chippendale's firm was more often in the habit of lining drawers with a

A Design for a Chimney Piece

Nº CLXXIX

Chippendale design for chimneypiece from *The Gentleman and Cabinet-Maker's Director*, 1762

marbled paper. Lady Knatchbull's dressing room was hung with verditer paper and then fashionably pasted with engravings. Chippendale also designed wallpaper for Harewood in account 4 September 1776, now lost. Oriental wallpaper was generally obtained by the clients themselves, since it was hard to come by and Chippendale's firm was responsible for the hanging only. At Harewood, however, Chippendale was able to supply eighteen sheets for the sum of £12 15s 0d. Carpets were supplied – the floor plan of the premises in 1803 shows a carpet room and the sale of stock in 1766 included carpets. He hired out furniture for various periods of time and also arranged carriage and storage for his patrons, especially during the time a house was being renovated or redecorated. He repaired and restored furniture to the degree of providing a new handle for a coffeepot for Sir Edward Knatchbull.

Marble slabs were imported for resale, china and glassware supplied for washstands, writing and dressing tables. Bedhangings and bedding were supplied to Dumfries House, Harewood and David Garrick's villa. The Garrick bed is the

only one to retain its original chintz hangings, made up by Chippendale from illegally imported Indian Chintz. Loose covers to protect expensively upholstered furniture were routinely supplied, curtains and blinds for windows and at Paxton House, Berwick, Scotland even a complete bell system to communicate below stairs.

Lack of evidence means that Chippendale's early career cannot be clearly traced. Between his baptism at Otley Parish church in Yorkshire on 5 June 1718 and his marriage to Catherine Redshaw at St. George's chapel, Hyde Park, London on 19 May 1748, nothing is known. Where he learned his trade as a cabinet-maker and designer is pure speculation, although over the years it has come to be said that he worked initially for his father, a local "joyner" and subsequently for the local gentry such as Henry Lascelles of Harewood and for the Fawkes family of Farnley. He is reputed to have worked for the Winn family at Nostell Priory, Yorkshire which would have been around 1740–45. The young architect James Paine also worked for Sir Rowland Winn at Nostell from 1736 and the two must have met. Paine studied at Hogarth's St. Martin's Lane Academy in London and could well have introduced Chippendale to this circle of artists and designers who were at the forefront of the dissemination of the Rococo style in England. Alternatively, Chippendale could have received instruction in drawing from a professional tutor – Matthias Darly, who engraved 98 of the plates in the first edition of the *Director*, and whose family probably shared a house with Chippendale, advertised in 1748 in the *Daily Advertiser* for tradesmen to attend his evening drawing classes.

The finest collection of *Director* period furniture is at Dumfries House, Ayrshire, Scotland for the 5th Earl of Dumfries where most of the furniture invoiced for in May / June 1759 and in 1763 and 1766 survives. It is the best documented of his earlier period. The first edition of the *Director* in 1754 had a large proportion of plates with Chinese elements (64 out of 161). By 1762 and the third edition, this was down to 43 out of 200 as interest waned, but Dumfries House was supplied with some spectacular Chinoiserie pieces, most notably a pair of oval pier glasses surmounted by a bust of a mandarin with coolie hat.

By including a number of Gothic designs in the *Director*, Chippendale risked being associated with a style in danger of becoming outdated and frivolous. Originally appearing as an antidote to the strictures of Palladianism in the 1740s, it had never been a mainstream style, being confined either to the antiquarian or to the merely decorative. However, Chippendale's inventive re-interpretation of the genre gave it new credibility: Chippendale's firm supplied only a few pieces in the Gothic style but other cabinet-makers continued to work in the Gothic manner. Four library bookcases made for Sir Rowland Winn's London house in 1766, with Gothic glazing bars taken from a *Director* plate are a rare example.

Furniture supplied to Nostell Priory, Yorkshire (Sir Rowland Winn) and Aske Hall, Yorkshire (Sir Lawrence Dundas) best illustrate Chippendale's transition to the Neo-Classical. Sir Rowland Winn seems to have held an influential position in Chippendale's affairs – letters at Nostell Priory indicate that he worked to advance Chippendale's career by recommendation and described his own patronage as a "friend's protection". Although the *Director* designs are rooted firmly in

the Rococo tradition, many of the details in the plates – caryatid supports, ram's heads and lion masks among many others, point the way forward to his later Neo-Classical work, with the library table at Nostell acting as a stepping stone between the two styles.

Harewood House, owned by Edwin Lascelles, is where his mature "Adam" period style can best be seen. Chippendale's initial visit to the house was in the summer of 1767 and the first furniture was delivered in April 1769. The entire contract most likely exceeded £10,000 and there survive some nine full and six incomplete sets of seat furniture in the Neo-Classical taste. There is a remarkable group of inlaid marquetry furniture including the incomparable library table, now at Temple Newsam House, Leeds. This writing table, with its classical inlaid decoration and applied English ormolu mounts, when compared with the writing table supplied to Nostell Priory around 1766 which has almost entirely carved decoration, marks Chippendale's complete shift away from his earlier *Director* style. His conversion to the Neo-Classical taste was eased by the emulation of certain of Adam's design motifs: Chippendale's library chairs of 1768 at Nostell Priory retain the lyre back splat and oval patera in the top rail of Robert Adam's chairs supplied to Osterley Park, Middlesex c.1767.

By the late 18th century, it was expected that architects would be involved in the furnishing of rooms in the buildings they had designed so as to achieve a continuity of style within the building. They were more influential than upholsterers or cabinet-makers since theirs was considered a superior art and consequently, one which brought higher social standing. Thus, while architects such as Wyatt or the Adam brothers took an active role in designing the furniture for their interiors themselves, this was something for which they charged. Chippendale, however, was able to offer the service nominally free of charge, i.e., within the price of supplying the furniture itself. This gave a certain commercial advantage. Nevertheless Chippendale's aristocratic patrons such as Sir Rowland Winn and Sir Edward Knatchbull demonstrated a cavalier attitude to settling their debts which resulted in a lifetime of financial insecurity. Towards the end of Chippendale's career, as his son took on more of the practical responsibilities in the firm, the financial situation stabilised somewhat. It is fortunate that superlative furniture continued to be made as the business passed to the succeeding generation in the person of Thomas Chippendale the Younger.

PAUL HARDY

Biography

Baptised in Otley, Yorkshire, 5 June 1718, the son of a joiner. Apprenticed to his father; trained in the workshop of the joiner and cabinet-maker Richard Wood of York; possibly taught design by Matthias Darly (fl.1741–72) who shared his house, 1753, and who engraved most of the plates for the *Director*. Married 1) Catherine Redshaw, 1748 (died, 1772): 9 children including Thomas Chippendale the Younger (1749–1822) who took over the business after his father's death; 2) Elizabeth Dixon: 3 children. Active in London as a designer and upholsterer from 1748; opened first premises 1749; moved to Somerset Court, 1752; new premises in St. Martin's Lane in partnership with James Rannie, 1754; partnership dissolved on Rannie's death, 1766; Chippendale Haig & Co. formed in partnership with Thomas Haig and Henry Ferguson, 1771. Designed a vast quantity of furniture, carpets and wallpaper for his

own and other firms, and for the influential pattern book *The Gentleman and Cabinet-Maker's Director*, published in several editions from 1754. Member, Royal Society of Arts, 1760. Died in Hoxton; buried 13 November 1779.

Selected Works

A portfolio of over 140 drawings ascribed to Chippendale is in the Victoria and Albert Museum, London which also holds designs by Matthias Lock for the *Director*. Two albums of drawings, including almost all Chippendale's drawings for the first edition of the *Director* are in the Metropolitan Museum of Art, New York. Approximately 700 items of furniture designed by Chippendale survive; notable examples are in the Victoria and Albert Museum, Temple Newsam House, Leeds, and Nostell Priory, Yorkshire.

Interiors

- 1759–66 Dumfries House, Ayrshire (furniture, wallpapers and curtains): 5th Earl of Dumfries
- 1763–66 Aske Hall, Yorkshire (furniture including a suite made by the Chippendale firm designed by Robert Adam): Sir Lawrence Dundas
- 1766–85 Nostell Priory, Yorkshire (furniture, wallpapers and curtains): Sir Rowland Winn
- 1767–78 Harewood House, Yorkshire (furniture, wallpapers and curtains): Edwin Lascelles
- 1767–79 Mersham Le Hatch, Kent (decorations and upholstery): Sir Edward Knatchbull
- 1768–78 Garrick's Villa, Hampton, Middlesex (furniture, wallpapers and curtains): David Garrick
- 1768–79 Burton Constable, Yorkshire (saloon furniture): William Constable
- 1772–75 Brocket Hall, Hertfordshire (furniture): Viscount Melbourne
- c.1772–76 Newby Hall, Yorkshire (furniture for the Tapestry Room): William Weddell
- c.1774–91 Paxton House, Berwick-on-Tweed (furniture): Ninian Home
- 1777–79 Petworth House, Sussex (beds and hangings): Earl of Egremont

Cinemas

With the first "electric theatres" dating from early in the 20th century, soon after the invention of "moving pictures", cinemas were one of the first modern building types. Although there are some notable exceptions, it is their interiors that are of greatest interest, rather than the characteristically box-like exterior forms. Films were first shown in converted rooms or halls, then featured as additions to the live programmes in theatres or music halls, or vaudeville theatres in America. The earliest purpose-built cinema interiors were merely rectangular halls with a stage and screen at one end, often with a barrel-vaulted roof. Decoration, if any, consisted of moulded plaster-work ribs or panelling effects. English examples that have survived are the Electric in Portobello Road, London (1905) and the Electric Palace in Harwich, Essex (1911). The English Cinematograph Act of 1909 led to more purpose-built cinemas appearing as it insisted on quite specific provisions, such as a separate fire-resistant projection box. In the United States early cinemas were known as nickelodeons and were most often store-front theatres with rows of hard seats.

From about 1912 cinemas, which were taking over in popularity from theatres, became increasingly theatrical in style, with the inclusion of boxes and balconies and elaborate Baroque or Neo-Classical decoration. In Britain, World War I, and the restrictions on building in force until 1921, limited the supply of new, larger buildings to meet the increasing demand for cinemas, resulting in the conversion of numerous theatres. Their interiors were updated and the provision of a circle became standard.

The Regent in Brighton (1921), by Robert Atkinson, was Britain's first "super" cinema and also the first notable cinema by a well-known architect. While traditional in design, its classical Italianate interiors show the influence of the American "hard-top" school (so called in contrast to the "atmospheric" school described below) and its principal proponent, Thomas Lamb. Lamb was a Scottish-born architect responsible for designing hundreds of cinemas in the United States. In New York he created the first of the vast, elaborately decorated, "movie palaces" or "picture palaces". These included many on, or near, Broadway from the 1914 Strand Theatre to the 1919 Capitol, with over 5,000 seats. His designs for the Loew

Corporation spread his work right across to the west coast. The opulent interiors were derived from the decorative classicism of Robert Adam, or from French Renaissance and Empire designs, with rich effects from gilt or gold leaf and marble, combined with deep carpets and crystal chandeliers. Lobbies were at least as grand as the auditoria, lined with marble columns and culminating in wide curving staircases. Other designers followed suit. The architects Rapp and Rapp, working mainly in Chicago, were famous for their "Sun King" style, first used for the foyer of the 1921 Tivoli Theatre, taken directly from the Chapelle Royale at Versailles.

The 1920s also saw the first of the so-called "atmospheric" cinema interiors. John Eberson, an Austrian-born architect working in America, developed a way of creating, within the auditorium, the illusion of being out-of-doors, under an open sky. This was done through the use of lighting, combined with stage-set building façades and rooftops, often covered in artificial vegetation, built around the auditorium walls and proscenium arch. Lighting effects might change the colour of the "sky" from that of sunset to dawn, with moonlight and stars between and projected clouds drifting across the sky. Lights behind the mock building fronts made them appear more three-dimensional, and the subdued level of lighting overall hid the artificiality and added to the sense of mystery. The Houston Majestic (1923) was the first, having the appearance of an Italian Renaissance garden complete with vines, statues and stuffed birds. Eberson was influenced by the Spanish Colonial architecture of Florida and Texas as well as European styles, and many of his atmospheric interiors were Spanish or Moorish in inspiration. His mosque-style Avalon (1927) in Chicago added to the illusion with a ladies lounge in the form of a harem and ushers wearing costumes of the French Foreign Legion. Such fantasies fed on and enhanced the element of escapism inherent in watching the films themselves. The success of this particular form of fantasy encouraged many other designers to create atmospheric interiors, even Thomas Lamb. In London four Astoria cinemas were built as atmospheric interiors by Somerford and Barr. They included the Brixton Astoria (1929), now the Academy, and the Finsbury Park Astoria (1930), latterly the Rainbow Theatre, with a mixture of styles from Moorish to Baroque. John Eberson himself designed one atmospheric interior in Europe, the Rex in Paris (1932). This is one of the few that still operates as an atmospheric, including a cloud machine.

From the beginning of the 1920s cinema designers became increasingly eclectic in their sources of inspiration. From 1922, following the discovery of Tutankhamen's tomb, the Egyptian style, the subject of many earlier revivals, became wildly popular in all areas of design. Architects Meyer and Holler built Grauman's Egyptian Theatre (1922) in Hollywood with a winged-scarab sounding board and sunburst grille above the proscenium arch and Karnak-like columns covered in Egyptian tomb paintings. Grauman's Chinese Theatre (1927), also in Hollywood, is better known. However, it is less authentic than the Fifth Avenue Theatre (1926) in Seattle whose auditorium is a duplicate of the throne room of the Imperial Palace in Peking. Many other American cinemas incorporated dragons, serpents and even buddhas into often unbearably elaborate "oriental" schemes. The Palace in Southall, London (1928) by George Coles, complete with Chinese interior, is the only

Cinemas: foyer, New Victoria, Westminster, by E. Wamsley Lewis, 1930

example of a Chinese-style cinema in Britain in spite of the potential influence of the Brighton Pavilion.

Pre-Columbian American cultures provided another source of inspiration for American cinema designers, having been popularized through Aztec and Mayan exhibitions such as that of 1893 in Chicago and of 1915 in San Diego. The 1915 Aztec Theatre in Eagle Pass, Texas incorporating linear, geometric decoration derived from Mexican Mitla masonry, was followed by the Aztec Theatre in San Antonio, Texas (1926). This featured a replica of a sacrificial calendar stone in the foyer along with funerary urns lining the walls. The proscenium arch is topped by a lintel decorated with a feathered serpent panel and sun symbol. Mayan theatres followed in Los Angeles in 1927 and Denver in 1930. In the former the decoration is synthesised to form an all-over surface effect.

Examples of other more localised design influences survive. In America Hispanic and Pueblo styles were popular in the Southwest and taken up by the Boller Brothers. Their KiMo Theatre in Albuquerque (1927) combines the Native American and Hispanic cultures in tiles and frescoes. In Europe the closest equivalent is the Filmtheater Tuschinski (1919) by H.L. de Jong in Amsterdam, possibly influenced by the native Indonesian styles of the Dutch colonies.

It was Germany that influenced developments in Europe in the next decade, bringing modernity into cinema design. Although Gunnar Asplund, a pioneer of Scandinavian Modernism, had designed an influential cinema in Stockholm in 1922, the Scandia, it was only an interior for a pre-existing building. As such it was a traditional rectangular shape and its decor, while comparatively simple in contrast to most cinemas

of that date, was very much derived from 19th-century Scandinavian classicism. Fritz Wilms, in his Berlin cinemas of the 1920s, such as the Luna Filmpalast, led the way in a new simplicity of interior design relying on broad curving sweeps of often unadorned concrete. Erich Mendelsohn's 1926 *Universum* in Berlin showed the new modern Functionalism at its best. Hans Poelzig, in his *Babylon Cinema* (1928) had also moved to a large scale simplicity after his earlier *Grosses Schauspielhaus* (1919), both in Berlin. Their use of lighting inside and out to emphasise the structural forms was to be very influential during the 1930s. The *New Victoria* of 1930 in London, by E. Wamsley Lewis, shows a direct German influence.

With the change to the "talkies" in the late 1920s a new era of cinema began. Good acoustics and sightlines became more important. Fan-shaped auditoria with plaster coving and sound boards catered for these needs. The stripped-down geometry and dynamic curves of International Modernism were combined with the decorative elements of Art Deco – wave patterns and fan shapes, concealed coloured strip lights and new, or newly adapted, materials such as holophane lighting, chrome, faience tiles, vitrolite, and mirror glass. The 1930s was the decade of the Odeons in England, with their characteristic house-style based on standardised design elements. The auditoria were generally large curved spaces with the walls and ceilings sculpted with broad bands of plain plasterwork, curved in plan or section, often converging on the proscenium arch. Illuminated organ consoles were a popular additional feature. The foyers and ancillary rooms, such as cafes, were often more elaborately decorated with specially designed seating and upholstery, and even clocks and carpets incorporating the Odeon brand name in their design. Harry Weedon was the most prolific Odeon architect and contributed to the overall stylistic unity of the Odeons. The *Muswell Hill Odeon*, 1936 by George Coles, in London, with its "cash register"-effect auditorium is a good surviving example.

Eclecticism continued into the 1930s, but Art Deco became the dominant style for cinemas. This popular form of Modernism suited the cinema industry very well and even found its way into film set design. Two other important designers of this period, working in England, who specialised in decorative schemes for cinema interiors illustrate both trends. These were John Alexander, whose designs survive to indicate original colour schemes, and Theodore Komisarjevsky. The *Northwick cinema* in Worcester of 1938 shows John Alexander's Art Deco style at its best with stylised mythical figures in a chariot either side of the proscenium and a pink, peach, and gold colour scheme. The Russian-born Komisarjevsky produced several amazingly richly decorated and glowingly coloured interiors. These were a continuation of the 1920s eclectic fantasies and included the *Granada Tooting* (1931), a Venetian Gothic gilded fantasy, and the *Granada Woolwich* (1937). This was a variation on the same theme, with additional elements from French Gothic cathedrals.

These were rivalled by the American Art Deco fantasies such as the *Hollywood Pantages* (1930) by B. Marcus Priteca, with its zig-zag excesses, or the *Oakland Paramount* (1931), by Timothy L. Pflueger, a classic of Art Deco with hidden lighting effects creating a *Fountain of Light* in the foyer and Columns

of Incandescence framing the stage. The *Radio City Music Hall* in the Rockefeller Center in New York, (1932) by Donald Deskey, was the largest movie theatre ever built and the last of the real movie palaces. The famous golden arches of the auditorium are preceded by a foyer with a vast 60 by 40 foot mural behind the stair, depicting a mythical landscape.

From these heights decline was perhaps inevitable. After World War II cinema attendances fell and few new cinemas were built. Many existing cinema interiors were sub-divided or converted to other uses, if they survived at all. Those built since then tend to be either diluted versions of the Odeons or plain boxes.

Selected Collections

Illustrations and documentation relating to British cinema interiors can be found in the following collections: Drawings Collection, Royal Institute of British Architects, London, and Cinema Theatre Association Archives, London. Substantial holdings of photographic records are also in the Greater London Record Office, London, and the National Monuments Record Centre, Royal Commission on the Historical Monuments of England, Swindon and London, which contains the Maltby Collection of photographs of Odeon cinemas. A provisional list of surviving "listed" cinemas in England appears in the *Cinema Theatre Association Bulletin* 1994. Material relating to American cinema interiors is held by the Theatre Historical Society, Chicago, and important examples are listed in Naylor 1981 and 1987.

Clein, Francis 1582–1658

German decorative painter and designer of tapestries and ornament

Francis or Franz Clein (Cleyn, Kleyn) was a German painter, tapestry designer and ornameniste active in Denmark and Britain in the early 17th century. He was born in Rostock in Mecklenburg-Schwerin in 1582, the son of the goldsmith Hans Clein from whom he learned the basics of drawing and engraving. A promising student, by 1611 he was working in the service of Christian IV of Denmark. A portrait of Christian IV is dated 1611, and between 1618 and 1623, following a decisively significant four-year study trip to Italy, Clein was employed on the decoration of several royal residences including Fredericksborg, Christiansborg and Kronborg. He also worked at Rosenborg Castle in Copenhagen where he decorated the Queen's chamber and painted Italianate grotesques in the king's writing closet.

During his stay in Italy, Clein was introduced to the distinguished virtuoso, Sir Henry Wotton and on his return to Copenhagen he met Sir Arthur Anstruther, the English ambas-

sador to Denmark. In 1623, Clein travelled to England, arriving with letters of introduction to the Prince of Wales, the future King Charles I, from both Anstruther and Wotton. He was warmly received by Charles's father, James I, who appointed him artistic director of the newly-established Mortlake tapestry works, founded in 1620 by Sir Francis Crane on the model of the Royal Tapestry Works of Henry IV. Clein was granted a pension of £100 a year, but almost immediately he had to return to Denmark to finish projects that he had begun for Christian IV. By 1625, however, the year that Charles I ascended to the throne, he was back in England where he lived and worked for the remainder of his life.

Clein's first project was to provide designs for the triumphal arch erected for the ceremonial entry into London of Henrietta Maria, Charles's bride, under the supervision of the Surveyor-General Inigo Jones. He was also employed on the decoration of the Queen's apartment at Old Somerset House, and at Wimbledon House, both royal residences where the work was directed by Jones. Clein's knowledge of Italian design was extremely useful to Jones, and his work clearly complemented the new classical style of architecture and interiors that Jones introduced to the Stuart court. It also appealed to other

Clein: North Drawing Room, Ham House, Surrey, 1637

members of the court and there are records of Clein's involvement at several aristocratic and great houses in the 1620s and 1630s. At Holland House, Kensington, for example, he not only decorated the gilt room but also designed some items of furniture including a set of Italian *sgabello*-type chairs that featured shell-shaped backs and classicising swags, masks and pendant ornament. Other versions of these chairs were used at Ham House where Clein was working in the 1630s; an example survives in the Victoria and Albert Museum, London. Additional commissions of this period include decorations at Carew House, Parsons Green, Bolsover Castle, and Stoke Bruerne, Northamptonshire, for Sir Francis Crane.

Clein's most important interior work was carried out at Ham House, near Richmond, between 1637 and 1639 for William Murray. Although the history of the early decoration of this house is somewhat unclear, Clein appears to have been responsible for the four inset panels depicting naked putti in the North Drawing Room, one of which includes a motif borrowed from Van Dyck. He also executed the highly elaborate decoration in the little Miniature Room, or the Green Closet, where the spandrels around the central panel of the ceiling were painted with a form of Italianate grotesques, and the long panels on the cove between the cornice and ceiling was decorated with landscapes containing putti, based on originals by Raphael's assistant, Polidoro da Caravaggio. Clein was also responsible for the design of a fireplace and chimney-piece and the finely carved and gilded balustrade on the Great Stairs.

Throughout this period, he was also busy at Mortlake. The first tapestries woven by the factory had been from Flemish designs, but changing fashions ushered in a taste for Italian models, particularly after the purchase of the Raphael cartoons in 1623. Clein's skill in designing ornament and grotesques was particularly well-suited to this style of work and c.1625 he produced copies of Raphael's cartoons with new, more elaborate borders including putti climbing twisted columns and festoons of fruits and terms, that were greatly admired. A set of these tapestries is now in the Mobilier National, Paris. Clein was also responsible for other designs, the most popular being a sequence of six or seven hangings depicting the tale of Hero and Leander; sets of these tapestries survive in the Swedish Royal Collection, Stockholm, and in the Primatial Palace, Bratislava.

Much of Clein's work as a tapestry designer and decorative painter was curtailed by the outbreak of Civil War in 1642, and although he seems to have retained his houses, first at Mortlake and later at Covent Garden, where he spent most of his later years, he was never again involved in such grandiose projects as those on which he had been engaged previously. Instead he worked chiefly as an engraver of ornament and designer of illustrated books. In 1632 he had provided the illustrations for an edition of Ovid's *Metamorphoses* (reprinted in Paris in 1637), and he also designed plates and ornamental frontispieces for John Ogilvy's editions of classics such as Aesop's *Fables* (1651), Virgil (1654, 1658) and Homer (1660). Although somewhat less numerous, Clein's suites of ornament were no less admired. He published the *Septum Liberales Artes* (1645), *Quinque Sensuum descriptio* (1646), *Varii Zophori figuris animalium* (1645) and *Several Borders of Grotesk Works Useful of Painters* (1654). All demonstrate a thorough

understanding of the repertoire of Baroque ornament and include numerous grotesque and acanthus friezes and panels, incorporating many birds and animals.

Given the fact that so little of Clein's interior work survives, and that some of his finest decorations, such as those in the Queen's Chamber at Old Somerset House which were much vaunted by the courtier Edward Norgate, are known only through descriptions, it is hard to judge the extent of his influence or skill as a designer. Indeed, the high praise accorded Clein by his contemporaries – one critic described him as “the most famous of painters, the miracle of the century” – sometimes seems inflated. Yet, he clearly played an important role in giving practical expression to the Italianate ideas espoused by Inigo Jones, and, along with that of Jones, Clein's work did much to help establish the classical style as the official style within court circles during the 1620s and 1630s.

DAVID CAST

Biography

Franz Cleyn. Born in Rostock, Mecklenburg-Schwerin, in 1582, the son of the goldsmith Hans Clein. Studied in Italy, c.1612–17, where he met Sir Henry Wotton and Sir Arthur Anstruther. Married: children included the painters Francis Clein the Younger and John Clein, and the miniaturist Penelope Clein. Employed in the service of Christian IV of Denmark, c.1611–23, executing decorative schemes for several royal castles. Appointed designer to the Mortlake tapestry factory, London, 1624; active there until c.1657. Permanently resident in London from 1625; also active as a designer of interiors and decorative painter. Published several suites of ornament from 1645. Active as an illustrator of books from the 1630s, producing plates for Ovid's *Metamorphoses* (1632), Aesop's *Fables* (1651), Virgil (1654, 1658) and Homer (1660). Died in London, 1658.

Selected Works

Examples of tapestries after Clein's designs are in the Primatial Palace, Bratislava, the Mobilier National, Paris, and the Royal Collection, Stockholm. Examples of Clein's decorative work survive at Ham House, near Richmond, Surrey, and a chair attributed to Clein is in the Victoria and Albert Museum, London.

Interiors

- 1618–23 Rosenborg Slot, Copenhagen (decoration of the interiors, including the Queen's chamber): Christian IV
- c.1625 Old Somerset House, London (decoration of the Queen's cabinet): Queen Henrietta Maria
- after 1625 Holland House, London (interiors and some furniture)
- 1630s Stoke Bruerne, Northamptonshire (decoration): Sir Francis Crane
- 1637–39 Ham House, near Richmond, Surrey (decoration and interiors, including the North Drawing Room and the Green Closet): William Murray

Clein worked for the Mortlake tapestry factory from 1624 to c.1657 and his work included cartoons and borders for Raphael's *Acts of the Apostles* (c.1625), and suites of *Hero and Leander* (completed 1636), *Horses*, and the *Five Senses*.

Publications

- Septum Liberales Artes*, 1645
- Varii Zophori figuris animalium*, 1645
- Quinque Sensuum descriptio*, 1646
- Several Borders of Grotesk Works Useful of Painters*, 1654

Clérisseau, Charles-Louis 1721–1820

French architect, painter and designer of interiors

Charles-Louis Clérisseau is an important figure in the genesis and diffusion of the Neo-Classical style in architecture and decoration in the middle and later 18th century in Italy, France, England, Germany, and Russia. His exact relationship to Giovanni Battista Piranesi and J.J. Winckelmann, major figures in the revival of interest in antiquity, and to his pupils and associates including Robert and James Adam, William Chambers, Friedrich Wilhelm von Erdmannsdorff and Thomas Jefferson, has been the subject of much debate. Equally as important is his precise role in the creation and spread of the Neo-Classical decorative style known in France as the Style Louis XVI, Pompeian or Arabesque, as the Adam in England, the Cameronian in Russia and Jeffersonian in America. While there is no doubt that he played a major part in the study and adaptation of ancient and Renaissance decorative details, particularly the arabesque and grotesque in the creation of a new decorative style, the early beginnings will never be completely clear.

Clérisseau trained as an architect in Paris and at the French Academy in Rome. He spent 17 years in Italy studying and drawing ancient and Renaissance architecture, emphasizing the decorative details as well as the architectural forms. These became the basis of the Neo-Classical style of decoration. He imparted his knowledge to his pupils, particularly Robert Adam who, with Clérisseau's help, created the Adam style, skilfully combining ancient and Renaissance motifs in an original and delicate new creation. Clérisseau's great wealth of drawings, made throughout his long career, sold by him to Catherine the Great of Russia in 1779, are closely related to Adam. What may be his earliest decorative work is the deco-

ration of the coffee house of the Villa Albani in Rome (1764) which is described as having Ionic pilasters with elegant arabesques and tiny bas-reliefs in white and scenes derived from antiquity. Winckelmann, who played a major role in Clérisseau's obtaining the commission, wrote that Clérisseau was also to execute large landscapes of the antiquities of Dalmatia and Southern Italy, but these may not have been carried out. The vicissitudes of the Villa and its various restorations make it unclear how much of Clérisseau's work has survived.

The other early decorative design by Clérisseau is the fantastic Ruin Room, painted about 1766 in the monastic cell of Père Thomas Le Sueur in the monastery, now convent, of S. Trinità dei Monti, Rome to resemble an ancient ruin inhabited by a monk, complete with crumbling walls, other decorative and architectural details, and a ruined vaulted ceiling. Originally it contained furniture in the ancient style, a sarcophagus desk and an upturned capital for a chair. Called one of "the wonders of Rome" it still exists, as do the drawings and descriptions of it in the Hermitage Museum, St. Petersburg. Executed in bright colours of reds, blues, greys, and greens, it is an exact and convincing evocation of classical antiquity. It is a tour de force of Neo-Classicism and continues a tradition of less archaeologically-correct painted ruin rooms stretching back to the Renaissance.

Considering Clérisseau's reputation as a pioneer of Neo-Classical decoration, very few of his works were executed and most of those were late in his career. His Roman house for Catherine the Great of Russia of 1773 was not built. The plans which survive resemble an enormous Roman bath set into Hadrian's Villa at Tivoli; it was rejected for this reason. The drawings of the interior resemble the works of his pupil Robert Adam and contain walls divided by niches, delicate arabesque panels and inset classical scenes, features which also appear in many of the imaginative drawings by Clérisseau among the 1,170 drawings purchased by Catherine. These later inspired the Russian works by Charles Cameron.

Clérisseau's designs for salons for two hotels for Laurent Grimod de la Reynière, Paris, 1775–77 and 1780–82 were executed, and much of the second one survives today in the Victoria and Albert Museum, London. The earlier one seems to have elements which were transferred to the second one, about which we know more. It consists of a rectangular room with large panes of arabesques with classical oval scenes of the life of Ulysses in the centre and small roundels above rectangular plaques, framed by arabesque patterns with urns, scrolls, flowers, birds, and drapery. These large panels are separated by thin rinceau strips. All of this decoration, which is painted on flat panels (not in stucco relief like many of the Adam works), is carried out in colour shades of pink, grey, blue-grey, green, and Pompeian red against a white background. The Ulysses ovals are in full colour. The tall rinceau panels are in gold and grey. Much of the actual painting was executed by Etienne de la Vallée, later Lavallée-Poussin, although the general scheme and probably much of the detail was done by Clérisseau.

Clérisseau's last important commission was between 1792 and 1794. It involved the decoration of the great hall and adjoining room at the Palace of Weimar. It was not executed, but a drawing of the hall exists. It consisted of a rectangular

room with balconies on all four sides supported by giant Corinthian columns surmounted by a rinceau frieze. The walls were to be divided into panels with friezes and decorative areas above crowned by a cornice of swags. The adjoining room was to be decorated with arabesque panels alternating with ruin scenes.

Clérisseau's greatest importance is as a teacher of other architects and in his thousands of drawings of ancient decorative and architectural details and designs in the antique style. Nearly all of these are undated. His exact role in the creation of the Adam style will probably never be clear. He seems to have worked on various Adam projects in the early 1770s while he was in England and it is suggested that he was then influenced by their work. Although Clérisseau is credited with introducing the arabesque style into France, the earliest dated examples are the panels at Bagatelle by François-Joseph Bélanger (1744–1818), a friend of Clérisseau's. And it was Giovanni Battista Piranesi who was the first to show the new archaeologically-correct *grotteschi* or arabesque as wall decoration in his *Diverse maniere d'adornare i cammini* of 1769.

THOMAS J. MCCORMICK

See also Adam; Arabesque and Grotesque

Biography

Baptized in Paris, 28 August 1721. Student under Germain Boffrand (1667–1754) at the Académie Royale d'Architecture by 1745; awarded the Grand Prix 1746; attended the French Academy, Rome, 1749–54. Remained in Italy until 1767 where he was active as a draughtsman, painter and designer of interiors and gardens; met G. B. Piranesi and Winckelmann; acted as tutor to Robert Adam (1728–92), 1755–57 and travelled with him to Diocletian's Palace, Spalato (Split, former Yugoslavia), 1757, and collaborated on Adam's book on the palace (published 1764). Returned to France, preparing plates for a book on Antiques (published 1778), 1767. Travelled to England, 1771; prepared designs for the Adam brothers. Resident in France by 1775, where he worked as an architect, painter and designer of interiors. Advised Thomas Jefferson on the building of the State Capitol, Virginia. Member, Academy of Rouen, 1810; Legion d'Honneur, 1815. Regular exhibitor, Society of Artists, and Royal Academy, London. Died in Auteuil, 19 January 1820.

Selected Works

The largest collection of Clérisseau's drawings, including unexecuted designs made for Catherine the Great, is in the Hermitage, St. Petersburg. Additional smaller collections of drawings are in the Fitzwilliam Museum, Cambridge, the British Museum, and Sir John Soane's Museum, London. Panels removed from Ashburnham Place, Sussex are from the decoration of the Hôtel Grimod, and are now in the Victoria and Albert Museum, London.

Interiors

- 1764 Villa Albani, Rome (decoration of the coffee house)
- c.1766 Monastery, Santa Trinità dei Monti, Rome (decoration of the Ruin Room): Père Thomas Le Sueur and Père Jacquier
- 1773 Roman House, St. Petersburg (unexecuted designs for the building and interiors): Empress Catherine II
- 1774 Lansdowne House, London (garden alcove, and unexecuted design for the gallery): Marquess of Lansdowne
- 1775–77 Hôtel Grimod de la Reynière, rue Grange-Batelière, Paris (salon decoration): Laurent Grimod de la Reynière
- 1776–89 Palais du Gouverneur, Metz (building and interiors)
- 1780–82 Hôtel Grimod de la Reynière, rue Boissy d'Anglas, Paris (salon decoration): Laurent Grimod de la Reynière

- 1792–94 Palace of Weimar (unexecuted designs for the salon and hall)

Closets

The closet was a small room, usually annexed to a bedchamber, gallery or library, that would now probably be called a study or an office. Also known as a *cabinet* in France, or as a *camerino*, *cameratta*, *studio* or *studiolo* in Italy, closets were very personal, intimately-sized rooms that were tucked away in the innermost reaches of a house, not easily accessible from the more public spaces. These rooms were variously used: as strong rooms in the Middle Ages where a rich householder would safeguard valuables; as an office in which to keep documents (private and business); as a study for learning and meditation (common in the papal apartments at the Vatican and at

Closets: Queen's Closet, Ham House, Surrey, c.1670

Avignon and among the clergy); as a treasury for the contemplation of art objects; or simply as a room in which friends could be entertained informally.

Medieval closets were spartan rooms appointed to suit the particular requirements of each inhabitant. During the Renaissance in Italy, closets (*studii*, or *camerinii*) increasingly became cherished havens for rich men of learning in which they could meditate, read and write, as well as store and display their growing collections of art, antiquities and curiosities. These *studii* were to some extent inspired by the writings of classical authors which contained references to the private studies or libraries in which they worked. Petrarch called his closet his "solitudo". According to contemporary inventories secular closets were already common in rich Italian houses in the early 15th century. The Medici residence on the Via Larga in Florence (1440), for example, contained at least three closets. Merchants and businessmen also had *studii*. A merchants' handbook of 1569, *Della Meratura et del Mercante Perfetto*, recommended placing one close to the bedchamber and another, a *scrittorio*, at some distance from the domestic areas of the house so as not to disturb the family with business matters.

Although the main motives of the 15th-century Italian closet were secrecy, privacy and solitude, they could also be quite richly decorated so as to do justice to the impressive collections of books, miniature paintings, and antiquities such as medals, coins and small statues or vases and gems that were housed there. Proper shelving was introduced, great emphasis was placed on the effective display of objects, and ceilings were often lowered to better suit the intimate proportions of the room. Within wealthy houses and palaces, closets were among the most expensively and sumptuously decorated rooms: Pietro de Medici's closet in the family residence on the Via Larga was famously opulent, as was that of his contemporary Federigo da Montefeltro, the Duke of Urbino. The Duke of Urbino's *studio* is probably the best known Renaissance example of its kind. It was used to house the Duke's priceless collection of theological manuscripts, medical treatises, Greek texts, and library of classical and contemporary writings, and the walls were richly decorated in fine pictorial intarsia (inlaid woodwork) above which portraits of famous men and allegories were painted.

During the 16th century the Italian closet became a more public space. Contemporary collectors' *studii* were opened up to selected members of the public who had appropriate letters of introduction, many of whom came to see the art on display. This practice was especially prevalent in Venice; Francesco Sansovino, a 16th-century Venetian writer, compiled a list of *casa aperte*, open houses in Venice with *studii* of interest.

In northern Europe the closets in great houses fulfilled similar functions. Closets were alternatively dressing rooms, venues for informal gatherings or secret meetings, or served as an escape route from the main apartment as many closets had access to the backstairs. These stairs performed another important role: they enabled servants to pass in and out of the bedchamber via the adjacent closet without having to cross the main rooms of the house. Although closets were still quite private, by the 17th century they had become more luxuriously appointed. Great care was lavished on their decoration and, unlike more public rooms, whose furnishings were dictated by

contemporary convention, closets were often decorated in a more personal, but at the same time, fanciful or experimental fashion.

Closets were located at the farthest end of the row of rooms that made up the formal apartment in a great house. They were often furnished with dressing tables, tea tables, and increasingly comfortable seating such as easy chairs or *fauteuils de commodité*. Daybeds and sofas were also typical. The informality of the closet gave householders the opportunity to experiment with more outlandish decorative schemes. Chinese themes were popular, as were glass or mirrored wall panels; Francis Bacon even noted a cupola. The Duchess de Valentinois took informality to an extreme, furnishing her closet with piles of cushions.

The opulence with which some 17th-century closets were decorated was symptomatic of the social aspirations of the householder. Many great houses were built to accommodate visiting royalty, either because the owner already had connections with the royal court or because he hoped to acquire them. The closet in the Queen's apartment at Ham House was decorated with red satin brocade hangings, gold and striped silk. Catherine of Braganza's own closet was decorated with sky-blue damask wall hangings with divisions of gold lace.

Towards the end of the 17th century many European great houses followed the French model in having two closets or cabinets; a larger closet served as a reception room for select company, and a smaller, more private closet was for very close friends or solitude. Louise de la Vallière, one of Louis XIV's mistresses, could seat 18 people in her grand cabinet; Madame de Maintenon's grand cabinet could accommodate 29 people, and the king's grand cabinet could house his entire privy council when he wished to discuss affairs of state. In England, the Duchess of Lauderdale had two closets adjacent to one another at Ham House. The larger "white" closet was lavishly decorated and very public; her "private" closet was more intimately, although still quite richly appointed, and was small and intended as a study.

Developments in collecting also influenced the appearance of closets. By the second half of the 17th century, a marked interest in scientific learning was matched by a growing fascination with the fine arts and collecting. Collections were divided into large and small objects; larger objects such as statuary and paintings were distributed in rooms such as the gallery, while smaller objects were displayed on shelves and in cabinets in the closet. The Green Closet at Ham House (1637-39) was exotically decorated so as to complement the collection of small treasures displayed there. Closets with art collections that were used for study were often located alongside libraries or galleries. The art collections of so-called "virtuosi" or "dilettanti" (terms used to describe a late 17th or early 18th century equivalent to the Renaissance humanist), were sometimes well-known and were a magnet for other cognoscenti or for educated visitors making a Grand Tour.

By the last quarter of the 18th century the functions of rooms had become less rigidly determined, and closets, libraries and galleries were used more diversely for recreational purposes. Corsham Court (1760s), for example, had a library with a cabinet en suite that doubled as a saloon and withdrawing room. Similarly, as bedrooms became more private, closets were used increasingly as dressing rooms or private

studies. Many of the functions previously served by women's closets were transferred to the boudoir in the late 18th and 19th centuries. By the beginning of the 19th century the closet had all but disappeared and it survived only in great houses as a relic, or reminder of a more codified way of life.

Coates, Nigel 1949–

British architect and designer

Attempts to categorise Nigel Coates's activities as an architect and designer are revealingly unsatisfactory. An architect who embraces teaching and theory, building, interiors, furniture and product design, Coates's work is not so much unified by a consistent style or aesthetic, but by an expressive approach that sets out to explore richer possibilities for the architecture of our cities in the late 20th century. It reflects the vibrant multi-layered cacophony of urban life and its vivid collision of past and present.

Coates's built projects are a series of interiors and buildings realised in Japan and Britain since the mid-1980s. They are instant urban monuments with the patina of history, like The Wall, literally a monumental stone wall that looks as though it could be part of some Roman ruin uncovered in the centre of Tokyo and converted for the use of some futuristic corporation; or like the Knightsbridge Jigsaw fashion store where a giant copper column (is it some antique relic or part of an ornate aircraft?) announces the shop's street presence, while a monumental terrazzo staircase draws customers upstairs into a room that seems to be modelled on the salone of an Italian palazzo. Or like the restaurants in Schipol airport that explore the artificial world of the airport and the promise of flight with surreal simulations of exotic locations. Exploiting the power of visual metaphor, ricocheting across the barriers of high and low art and sampling across time and cultures, Coates's environments characteristically set out to engage the user on the level of the imagination as well as functional "reality".

Coates first studied architecture at Nottingham University but it was his immersion in the dynamic atmosphere of the Architectural Association (AA) in the 1970s, where Coates was first a student and later taught, that the formative influences converged. At the time the AA, under the directorship of Alvin Boyarsky, was run more as a forum for the exchange of ideas with an international outlook than as a conventional school. Coates was drawn to the experimental work of Swiss architect Bernard Tschumi who brought a political dimension to architecture, and an approach based in the visual arts that was to have a profound effect on Coates. Tschumi introduced Coates to the work of the anarchic French group, the Situationists, who saw the city as a theatre of experience and superimposed maps of the imagination onto the geography of the city to create a new dimension of urban experience.

At the same time Coates, who was awarded a scholarship to Rome University in 1978, began to explore other disciplines to enrich his approach to architecture. He was influenced by the narrative structure of film – in particular the work of Pasolini – and also by 18th-century Italian garden design, where the garden is conceived as a stage for a series of choreographed events and the visitor as a participant creating their own narrative from their experience.

These ideas crystallised in a series of projects for London carried out first in collaboration with Tschumi and then with students from Unit 10 at the AA, which Coates took over teaching from Tschumi in 1979. In 1983 Coates formed a group of self-styled architectural anarchists with eight of his Unit 10 students who called themselves NATO, an acronym for Narrative Architecture Today.

In a series of catalytic projects including Albion, Ecstasy and Giant Sized Baby Town – typically the name came from a song by the punk group Bow Wow Wow – NATO attacked the sterility of urban planning and controlled zoning, and promoted a scrambled vision of the city as playground, offering residents a rich arena of possibilities. They celebrated the conflicting energies of urban life, the possibilities of change and the regeneration of industrial buildings, drawing as much on the Situationists' dream maps of the city as the subversive concerns of punk and street culture.

In keeping with their sympathy with youth subcultures, NATO's ideas were broadcast in magazine format: large newsprint pages overspilling with frenzied expressionistic drawings of the city in a state of flux, combined with charged texts that borrowed as much from the manifestos of the Italian Futurists as youth culture.

NATO's ad hoc approach to urban design and concern with imaginative regeneration were in tune with current directions in the visual arts, design and fashion: in particular the design movement led by Tom Dixon whose furniture was built from industrial parts salvaged on the city's streets and recycled with decorative euphoria. It also reflected the concerns of sculptor Tony Cragg whose work drew new imagery from found objects, and the designs of fashion designer Vivienne Westwood which plundered pageant and the dressing-up box as freely as the illicit and fetishistic.

In 1985 NATO held an exhibition "Gamma City" at the AIR gallery in London. The show began on the street with the zebra crossing extended to lead into the show, literally and symbolically breaking down the barriers between street and

Nigel Coates: L'Arca di Noè, Sapporo, Japan, 1988

gallery, and NATO's work and the real world. Inside provocative polemic recast the city as a chaotic collage of dreams, subcultures and romanticised decay, celebrated in a jumble of the spare parts of urban life. Overhead televisions flashed Gamma city slogans: "Gamma-city is not a style but a political, social and aesthetic attitude based on crumbling signs and

processes ... Exchanges is a basic act of architecture and its space the street. Gamma streets double-up as home, market, factory, bar switching old images for new uses".

Critics incited by the celebration of post-industrial fantasies, the scrapyard and the slum, and the parade of imagery drawn from youth subcultures regarded NATO's work as lacking

serious intent and noted the impossibility of bridging the gap from paper to reality. But to read NATO's proposals as blueprints for the city was to miss the point: its intention was to challenge the accepted authority of a tired Modernism and open new ways of thinking.

It was not in Britain that Coates was first able to move from paper architecture to the built project. This opportunity was provided by the booming entertainment and fashion industries of Tokyo in the mid-1980s which proved a voracious consumer for Coates's sophisticated theming and theatrical vision through the contracts entrepreneur and self-styled "architectural producer", Shi Yu Chen and his company CIA, Creative Intelligence Associates.

In 1985 Coates formed the partnership Branson Coates with architect Doug Branson to realise his first Tokyo commission, the Metropole, a restaurant in a former garage conceived as fantastical stage set layered with classical references sampled across time and cultures. This was followed by Caffé Bongo with an aircraft wing strapped to the façade celebrating the mythology of flying and the exchange of ideas around the world. The Hotel Otaru Marittimo was a hotel in the port of Otaru in the north of Japan where guests were invited to go on a voyage through rooms recalling the city's history as much as the imaginative possibilities of travel. In Japan too, Coates realised his first building, the L'Arca di Noè. This was a restaurant and bar in the city of Sapporo that took the form of an Ark, a massive concrete structure that looked as though it had been chiselled from a rock, playfully exploiting the triangular site on the island of Hokkaido.

If it seems extraordinary that Coates's built projects, so Western, even Eurocentric in their references, should find an audience in Japan, arguably such high-octane flamboyance was an end in itself in an all-consuming consumer culture. Prompted by Shi Yu Chen, Japanese backers were able to translate Coates's prowess for attention-grabbing prominence into commercial success. The other side of this coin is, of course, a swift turnover of ideas and obsolescence reflected in the short lifespan of Coates's projects in Japan.

The developer's urge for instant gratification generates difficulties of its own, perhaps most apparent in the Penrose Institute, a contemporary art gallery, or as Coates described it an "art silo" housed in a glass tower attached to The Wall and funded by its developers. While the comparatively sober glass structure revealing the lift in its core seemed to mark a new direction for Coates, the desire to create a landmark takes precedence over the gallery spaces it contains.

With his built projects Coates continued the collaborative working method established with NATO, inviting artists and designers to participate in interiors which energetically encapsulated current directions in British design and the decorative arts. Collaborators have regularly included the artists Stuart Helm and Adam Lowe, and the designer Tom Dixon as well as members of the original NATO group.

Coates views the different perspectives incorporated in a collaboration as opposed to a building with a single author as vital to the creation of what he describes as "a harmonious discord". In Coates's conception the multiplicity of voices is mirrored by the multiple-possibilities offered to the inquiring visitor.

Coates's office also designs much of the furniture used in his

interiors. In fact new designs frequently arise from the needs of a particular architectural project. The Noè range was designed for the Arca di Noè and has a similar primitive rough-hewn feel; while the Slipper range is an update on a Victorian boudoir chair designed for Liberty's shoe department. The eroticised anthropomorphism characteristic of Coates's furniture recalls the work of Italian architect Carlo Mollino and his witty fusions of furniture and the human body, and even the surreal imagery of Salvador Dalí. For Coates, Mollino also represents a significant model for the role of author, an architect whose work encompasses different spheres of activity from furniture to a building and whose vision is vibrantly enriched by reference to sphere of the imagination.

Biography

Born in Malvern, Worcestershire, 2 March 1949. Studied architecture at the University of Nottingham, 1968–71, and at the Architectural Association, London, 1972–74. Awarded a travelling scholarship to Rome, 1978. Employed as a unit master at the Architectural Association, 1979–89; course master, Bennington College, Vermont, 1980–81. Founder member, NATO (Narrative Architecture Today), 1983. Founding partner, with Doug Branson, Branson Coates Architecture, London, from 1985. Interior and architecture commissions in Japan, from 1985; appointed house architects to Jigsaw, 1988, and Liberty, 1992 (both London). Received Japan Inter-Design award, 1990. Numerous lectures on architecture in Britain and abroad; frequent exhibitor at national and international exhibitions.

Selected Works

Examples of Coates's drawings, and one of his chairs is in the Victoria and Albert Museum, London. A complete list of Coates's architectural and interior commissions up to 1990 appears in Poyner 1989.

Interiors

- 1985 Metropole Restaurant, Tokyo (interiors and furnishings)
- 1986 Caffé Bongo, Parco Department Store, Tokyo (façade, interiors and furnishings)
- 1986 Bohemia Jazz Club, Takeo Kikuchi building, Tokyo (interiors and furnishings)
- 1986–87 Jasper Conran Shops, London and Dublin (interiors)
- 1988 Katharine Hamnett Shops, Glasgow and London (interiors)
- 1988 Jigsaw shops, London and Bristol (interiors)
- 1988 L'Arca di Noè restaurant building, Sapporo (building, interiors and furnishings)
- 1989 Hotel Otaru Marittimo, Otaru, Japan (interiors)
- 1990 Katharine Hamnett Shop, Tokyo (interiors)
- 1990 The Wall, Nishi Azabu, Tokyo (building and interiors)
- 1991 Taxim Restaurant, Istanbul (interiors)
- 1993 Nautilus and La Foret Restaurants, Schiphol Airport, Amsterdam (interiors)
- 1993 Art Silo (Penrose Institute), Tokyo (building and interiors)
- 1995–96 Geffrye Museum, London (extension and exhibition layouts)
- 1996 Bargo bar/restaurant, Glasgow (interiors and furnishings)

The majority of Coates's interiors include custom-made furnishings. His furniture designs have been commercially produced by the Japanese firm Rockstone from 1987, the London firm SPC from 1988, and the Italian firm Bigelli, from 1989.

Coates, Wells 1895–1958

Canadian architect and designer

Wells Coates was at the forefront of modern architecture and design in inter-war Britain. He was an engineer by training, and his lack of a conventional architectural education was undoubtedly a source of some insecurity, but his understanding of materials and industrial processes informed his design thinking, and was a fundamental influence on his utilitarian aesthetic.

Coates’s earliest domestic commission as an interior designer was the refurbishment of 1 Kensington Palace Gardens (1931), where he replaced the ornate late-Victorian interior with rather “moderne” furniture and fittings almost all to his own design. Although the refurbishment was characterised by flush surfaces and plain finishes, it was not without decorative touches. A frieze of ballet figures by John Armstrong was painted on the ballroom wall; the dressing table in the master bedroom was equipped with “rotatable” tinted mirrors; and the steel legs of the dining table were

encased in green glass. Doors were done away with and bay windows hidden behind sliding silk screens, a device Coates also used at Charles Laughton’s flat in Gordon Square (1931), and which was clearly influenced by Japanese interiors. As was to become clear later, it was built-in furniture that most preoccupied Coates when designing interiors, and here was no exception; a single built-in unit in the drawing room brought together the radio, gramophone, cocktail-cabinet and bookcase. Despite the striking “before and after” views of the house which appeared in the architectural press, it was Coates’s belief that “design must begin from the interior *plan* ... as generator”, and it is for his subsequent experiments in interior planning, as well as a more International Modern style, that he is best remembered.

The Isokon flats on Lawn Road in Hampstead (1933) firmly established Coates as one of the leading protagonists in the UK of what became known as the International Style. As he was, to some extent, client *and* architect (having co-founded the Isokon company in 1931), the building allowed him to explore his own design philosophy and affirm his commitment, until then simply theoretical, to the advantages of flat living; the socially responsible use of land, provision of communal services, use of standardized parts etc. Designed as “ready-to-live-in” dwellings, the flats sought to relieve their single, mainly middle-class, occupants from the unnecessary encumbrance – as Coates saw it – of furniture ownership. Indeed, writing in the *Architectural Review* in 1932, Coates had argued that; “Furniture in the dictionary sense will take its place in the logic of construction, becoming an integral part of architecture”. Nevertheless, like many architects, he undoubtedly also relished the opportunity of perhaps avoiding his designs being compromised by their occupants’ furniture choices. Each of the 22 “minimum” flats occupied only 271 square feet (25 square metres), and was equipped with standardized built-in furniture, designed for maximum economy of space. Unlike the furniture at Kensington Palace Gardens, that at Lawn Road made no concessions to decoration, its aesthetic being derived from its function, as well as the appearance of the modern materials from which it was constructed. Of these, plywood was the most prevalent, making up the sliding table, stools, built-in bookcase units and doors, although tubular steel was also in evidence, forming the sub-frame of the table.

This seminal experiment in minimum living was taken a stage further in Coates’s own flat at 18 Yeoman’s Row, Knightsbridge (1935), where he again made great use of uncompromisingly modern built-in furniture. Of equal significance here, however, was his use of a “2-1” section. The living area occupied most of the flat on the top floor of the terraced house, while a smaller space at the rear of the flat was subdivided horizontally to provide two sleeping galleries on one level and a kitchen and bathroom on the other. A keen yachtsman, Coates was undoubtedly influenced by the design of boats: sleeping areas were entered via utilitarian ladders, while services were hidden behind sliding hatches. At Palace Gate (1937–38), arguably his most important building after Lawn Road, Coates was able to apply some of the thinking behind Yeoman’s Row to a large-scale residential development. Designed around an ambitious “3-2” section – where the height of two living rooms was equal to three bedrooms – the flats were equipped with an abundance of built-in furniture

(now also serving as room dividers), again executed in a spare Modernist idiom. Although Coates did design some rather conventional loose wooden furniture for the model Palace Gate flat shown in Bristol in 1936, the flats as built did not offer as complete an environment as those at Lawn Road.

Coates also designed some notable interiors outside the residential sphere. Indeed, it was his factory and shop interiors for the Cresta Silks chain (1929–32), and more specifically his use of plywood in them, which had first impressed Jack Pritchard and led to the formation of the Isokon company. At a time when plywood was generally seen as a cheap and inferior alternative to solid wood, Coates exploited its intrinsic properties to produce modern, standardized shop fittings, entirely free of decoration.

The dramatic effects studios at Broadcasting House (1931) gave Coates the opportunity to design his most futuristic interiors. Despite the building's rather half-heartedly modern exterior (designed by Val Myer), the British Broadcasting Corporation wanted the studios to embody the modernity of the broadcasting medium, and, as such, Coates was probably less restricted by aesthetic convention than on any other project. His essentially engineering-based, aesthetically-spare interiors were characterised by the use of extremely modern materials – notably, anodised aluminium alloy – and ingenious purpose-designed fittings, some of which became standard broadcasting equipment. While the lack of any conventional sort of decoration could be put down to the demanding technical requirements of a broadcasting studio, the interiors, through the use of bold curved forms, displayed an extremely expressive quality.

Most of the furniture Coates designed throughout his career was for specific interiors, although he was also responsible for a number of pieces which secured a wider exposure. These included simple plywood bookcase units of the type used at Lawn Road, and some elegant, albeit slightly formulaic, tubular steel furniture for Practical Equipment Ltd (Pel), first used at Coates's Embassy Court in Brighton (1934). It was for the design of radio cabinets, however, that Coates received widespread and popular recognition. As at the BBC, there were few firmly established aesthetic conventions to which he needed to adhere, and his most famous and successful model, the circular Ecko AD65 (1934), is today widely recognized as a mark of the up-to-date 1930s interior.

In the years following World War II, Coates was involved in a wide variety of projects in both Britain and Canada, including housing and hotel developments, town-planning, and product design. However, all but one of the architectural commissions – the “Telekinema” at the Festival of Britain (1951) – failed to materialise and in 1955, Coates finally accepted an invitation to teach at Harvard.

While Lawn Road and Palace Gate undoubtedly represent significant contributions to Modernist thinking, other projects, such as Embassy Court (which featured decorative pictorial murals by Edward McKnight Kauffer), do not sit quite as comfortably alongside the work of the established European “masters”. Nevertheless, between the wars, Coates was one of only a handful of individuals in Britain committed to modern design, and, through his few extremely significant buildings, as

well as an important series of radio broadcasts, he played a pivotal role in the introduction of Modernism to Britain.

Biography

Wells Wintemute Coates. Born to Canadian parents in Tokyo, Japan, 17 December 1895. Studied engineering at the University of British Columbia, Vancouver, 1913–15 and 1919–21; and for a Ph.D. at the University of London, 1922–24. Served as a lieutenant, Canadian infantry, 1915–17; pilot, Royal Air force, 1917–18; Wing Commander, Royal Air Force, 1939–45. Married Marion Grove, 1927; one daughter, Laura. Draughtsman and journalist in London and Paris, 1923–26; engineer / architect, Chryseide Textiles Company, London and Cornwall, 1927–28. Settled in London 1929; in private practice as a designer and architect, 1929–39, 1945–52, and 1956–58; in partnership with David Pleydell-Bouverie, 1933–34; with Patrick Gwynne, 1935–39; with Jacqueline Tyrwhitt, 1949–52; with Michael Lyell, 1954–56; architect / planner, Iroquois New Town, Ontario, 1952–54; visiting professor, Harvard University; resumed private practice, London, 1956–58. Designed furniture and interiors from late 1920s; radios and electrical appliances from c.1932; aircraft interiors and experiments with transportation from late 1940s. Consultant for Isokon from 1931; member, Twentieth Century Group and Unit One 1933–35; founder-member, Modern Architecture Research Group, 1933–34. Published many articles on architecture and design during the 1930s. Numerous honours, including Fellow, Royal Institute of British Architects, 1938; Royal Designer for Industry, 1944; Officer, Order of the British Empire (OBE), 1944. Died in London, 17 June 1958.

Selected Works

A large collection of Coates's architectural drawings and designs is in the Drawings Collection, Royal Institute of British Architects; examples of his furniture are in the Victoria and Albert Museum, London. A list of his principal architectural and design commissions appears in Cantacuzino 1978.

Cockerell, Samuel Pepys 1753-1827

British architect

Descended on his mother's side from the diarist Samuel Pepys, S.P. Cockerell is one of the least-studied architects of late 18th and early 19th-century England. Trained in the architectural office of Sir Robert Taylor, and an exact contemporary of John Soane, Cockerell followed on the heels of Adam, Dance, Holland, and Wyatt. His practice included country houses, churches, and government buildings, for which he designed interesting and significant interiors. He built upon the Neo-Palladian interior vocabulary of the earlier 18th century, upon Adam's newer classicism, and upon contemporary French inte-

riors, and became the first English architect to mix Indian, Gothic Revival, and Neo-Classical styles for exotic interior effects. Cockerell exhibited great skill in spatial distribution and sequencing, the plans of his houses being among the most sophisticated of the late Georgian and Regency periods.

Cockerell's concern for the design of interiors expressed itself in practical counsel to his son, the architect Charles Robert Cockerell, as the latter passed through Paris in 1817, returning from his investigation of temples in Greece. Cockerell wrote: "Decoration [provides] the most extensive employment [in England] and you will ... find more importance attached to the decoration of a Saloon than to the building of a Temple; if you can therefore bend to the consideration of what is called the fittings up of the interior of the best Hotels and Palaces of Paris, the graces of their *Meubles* and the harmony of their Colours in Hangings painting and Gilding you may be the general Arbiter of taste here."

In his domestic floorplans Cockerell disposed rooms with great cleverness in planning and circulation. At Middleton Hall, Carmarthenshire, Wales (c.1793-95), he juxtaposed multiple circulation systems. The major public rooms revolved asymmetrically about a small central vestibule, or circulation cell, from which the servants could quickly radiate in any direction, while public circulation moved in a perimeter, or ambulatory, route that led sequentially from one principal room to the next. The main suite of rooms, along the garden front, was connected by a formal, French *enfilade*. Similar planning systems appeared in other Cockerell residences, such as Admiralty House, London (1786-88), Wyndham House, Salisbury (1788), and Sezincote, Gloucestershire (c.1805).

Cockerell also developed an interesting system of articulating space by gender. The ground floor of his houses often included a "Gentleman's suite" and a nearby library, "masculine" interiors that he gave rectilinear shapes, plain walls, and the bold, architectural mouldings of the older, Neo-Palladian style. His most notably "masculine" interiors were, appropriately, the public rooms of Admiralty House, London, the official residence of the Lord High Admiral of the Royal Navy. In a Cockerell house, the most distinctly "feminine" space was the Lady's Saloon, a room in which the mistress of the house spent her time and entertained company. It usually occupied the center front of the first, or chamber, storey. Both Middleton Hall and Daylesford (1788-93) in Gloucestershire had such rooms. The Lady's Saloon at Daylesford survives. It is a jewel-like space, ornamented with a highly restrained version of the Adam style, with stucco ornamentation gilded and painted in pale blues. The room is a rotunda, with a double-shell dome supported on slender columns with palm-tree capitals, behind which alternate wall piers, mirrors, and niches. The lower dome is pierced by an oculus through which one views a *trompe-l'oeil* sky painted on the upper dome and illuminated by concealed windows. Cockerell's particular uses of the older Neo-Palladian style, and the newer classicism of the Adam style, seem to indicate his personal critique of these major, interior decorative trends of 18th-century England. He considered the robust classicism of the Neo-Palladian style to be appropriate for masculine interiors, and the delicate classicism and attenuated proportions of the Adam style to be appropriate for feminine ones.

Cockerell also exhibited an eclectic appreciation for past

Cockerell: interior of Dome Room, Daylesford, Gloucestershire, 1788–93

styles in his ecclesiastical interiors. At the Tickencote Parish Church in Rutland, he restored and rebuilt a 12th-century church and its interiors in a revived Norman style (1792); at Banbury Church, Oxfordshire, (1792–97), he designed a new building, but with the nave based on Christopher Wren's St. Stephen Walbrook, London (1672–79), a kind of "Baroque revival" interior. Cockerell's appreciation for and adaptation of the earlier stylistic vocabularies of 18th-century Neo-Palladianism and 17th-century Wren-Baroque was quite unusual at a time when both had generally passed from favor.

Cockerell's critical adaptation of previous styles also opened for him the possibility of re-using earlier decorative and architectural elements within his interiors. In the public rooms of Admiralty House, he re-used a series of fine, carved-marble mantelpieces from an earlier, 18th-century London residence. While this decision accorded well with the "revived" Neo-Palladian boldness of his Admiralty interiors, it would have been almost unthinkable, say, for Adam or Soane, with their near-mania for the total design of interiors in every detail. But Cockerell could also completely detail a space by designing all its decorative accessories. For the inner hall at Admiralty House, he not only designed all the interior architectural elements but also a superb cast-iron stove in the symbolically

appropriate form of a Roman naval, or rostral, column with ships' bows protruding from it.

Cockerell's most notable contribution to the design of English architecture and interiors was his introduction of an exotic eastern vocabulary based on Indian sources. This was invented for two "nabob" clients returned from India: Warren Hastings, the controversial Governor-General of Bengal, and his own brother, Sir Charles Cockerell, an official in the East India Company. The houses of both men, on nearby estates in Gloucestershire, involved extensive remodelings of, and additions to, earlier buildings, an exercise at which Cockerell was particularly adept. At Daylesford, Hastings's country house, the Indian influence was confined primarily to the interiors. The exterior is quietly classical with only a hint of Indian influence in the dome of the garden front. Hastings brought back from India paintings, fabrics, jeweled mementos, Persian armour, and suites of gilt and ivory furniture decorated with tiger heads, the latter given him by the Begums of Oudh. As a setting for these treasures, Cockerell blended Indian and Neo-Classical forms to create interiors at once splendid and restrained: cornices of gilded lotus leaves, mantlepieces carved with palm trees, elephants, and Eastern allegorical figures, and draperies of muslin edged with silver spangles and "beetle wings." Hastings's Indian furniture was augmented with satinwood and painted furniture by Ince and Mayhew of London.

Sezincote (1805 onwards), the country house of Cockerell's brother, was the first complete English country house in the "Indian" style. The exteriors are ornamented with *chattris*, *chuijas*, minarets, scalloped arches, and an onion dome. The interiors are a skilful and eclectic blending of Neo-Classical, Indian, and Gothic forms. Cockerell excelled in the design of staircases; that at Sezincote is perhaps his best. One approaches through Gothic-arched doors into the hall, where a divided "imperial" staircase with Greek anthemion balustrades leaps overhead on pierced, cast-iron beams. The hall is lighted from above by vast, classically-detailed clerestory windows alternating with channeled, Byzantine pendentives which support a classical dome inside, and a copper-sheathed onion dome on the roof. The saloon, with its great bow window, has a deep, coved ceiling of gilded, interlacing Gothic arches. Sir Charles Cockerell's bedroom, in an octagonal pavilion attached to the main house by an arcade, was fitted up to emulate an Indian tent supported on ornamental spears.

The exotic interiors of Daylesford and Sezincote, though they exhibited a certain Neo-Classical restraint, acted as precursors to the Anglo-Indian interiors of the Prince Regent's Brighton Pavilion and the many exotic Regency interiors which followed. Though Cockerell's career needs more study, it is safe to say that his sensitive and studied eclecticism, with its revival and mixing of multiple historical styles, predicted many of the important trends of the later 19th century.

PATRICK A. SNADON

Biography

Born in London, 6 January 1753. Related through his mother to the diarist Samuel Pepys; his father was John Cockerell and his son was the architect C. R. Cockerell (1788–1863). Pupil of Sir Robert Taylor from 1768; took over Taylor's office after his death in 1788. Appointed District Surveyor, St. George's, Hanover Square, 1774;

clerk of works, Tower of London, 1775; clerkship, Newmarket, 1780–82. Appointed Inspector of Repairs to the Admiralty, 1785; surveyor, Foundling and Pulteney estates, London, 1788 (resigned 1808); obtained surveyorship, Victualling Office, 1791; surveyorship, East India Company, 1806; surveyor, sees of Canterbury and London, 1811–19; surveyor, St. Paul's Cathedral, 1811–19. Co-founder, Architects' Club, London, 1791. Pupils included the architects B.H. Latrobe, William Porden, C.H. Tatham, and C.R. Cockerell. Died in London, 12 July 1827.

Selected Works

A collection of Cockerell's drawings is in the Royal Institute of British Architects, London. A full list of Cockerell's architectural commissions appears in Colvin 1995.

Interiors

- 1786–88 Admiralty House, London (building and interiors)
- 1788–93 Daylesford House, near Moreton-in-Marsh, Gloucestershire (building and interiors; some furniture by Ince and Mayhew): Warren Hastings
- c.1793–95 Middleton Hall, Carmarthenshire, Wales (building and interiors): Sir William Paxton
- 1799–1802 St. Margaret's Church, Westminster (repairs and redecoration)
- c.1805 Sezincote House, near Moreton-in-Marsh, Gloucestershire (building and interiors): Sir Charles Cockerell

Cocktail Cabinets

The cocktail cabinet was a fashionable novelty in the domestic furnishing of the inter-war period. It brought a whiff of urbanity, sophistication and glamour into middle-class life, where its entry into the modern suburban lounge marked the acceptance of drinking as a respectable social activity. The cocktail cabinet was not gender specific, unlike its ancestor, the more general drinks cupboard, which formerly would have demarcated the room it occupied as distinctively masculine.

The cocktail drink itself emerged together with the night-clubs which opened following World War I. According to H.

Craddock, the barman at the London Savoy Hotel who compiled *The Savoy Cocktail Book*, it was named after a legendary Mexican princess called "Cocktel" and made of a mixture of different ingredients mostly with alcoholic content. To the "bright young set" the cocktail meant emancipation and a hedonistic lifestyle, but to the older more traditional generation it represented an affront to British values of class and taste. Gin, the main ingredient in a "martini" cocktail was thought of as a cheap working-class drink only associated with the "public" – the pub, while vermouth had dubious Latin connotations. Both the wine cupboard and the "smokers cabinet" had respectable and gentlemanly precedents, but a cocktail cabinet was seen as conspicuous consumption and in poor taste. Middle-class manuals preached against the "vulgar" show of large quantities of drinks and tobacco, claiming it made the home too much like a public bar.

With the greater emancipation of women, precipitated by World War I, drinking and smoking were no longer considered an exclusively male indulgence. The custom of separating the sexes after a dinner party, leaving the men to smoke and drink in the dining room, became as outdated as the smoking-jacket. In the inter-war period the informal cocktail party became a popular and fashionable alternative to the dinner party. By the 1930s the cocktail cabinet was a much more acceptable and general piece of furniture, displacing the inherited Victorian parlour piano and standing as a symbol of modernity alongside the gramophone.

Because of its lack of pedigree the cocktail cabinet has not been categorised as an antique and therefore has been of little interest to collectors. Examples only started to be cited in books and added to museum collections towards the end of the 1960s when a return of interest in historic styles began to include the 20th century. Art Deco revivalism was presaged by a Musée des Arts Décoratifs exhibition in Paris – *Les Années Vingt Cinq* held in 1965. While traditionalists and strict Modernists have not considered the cocktail cabinet of any interest, some 20th-century historians have recognised it as a worthy subject, both as a typical item of inter-war decorative art as well as an aspect of modern material culture. In *Art Deco* (1968), just one in a large wave of publications coinciding with the fashion for Art Deco interior design, Bevis Hillier refers to the inter-war period as "the cocktail age", and features on the back cover an illustration of a "cocktail cabinet" made from a converted grandfather clock, demonstrating a humorous disregard for good taste.

The cocktail cabinet took a variety of forms – often as a two-tier arrangement of cabinet over a cupboard or on a stand, legs, plinth or single column. Sometimes it was discreetly built-in to a wall or a range of fitments; occasionally it was incorporated into a trolley to make it mobile. Styles varied from the severely functional with nothing but the grain of a natural wood veneer to relieve modern square lines, to the flamboyantly ornamental with fluted and contoured fronts. The craftsmanship available in the inter-war period and modern styling also combined fashionable blonde veneers with contrasting geometric marquetry. More lavish examples were covered completely in mirrored glass. The typical cocktail cabinet interior was mirrored and illuminated by concealed lighting, fully fitted with an array of chrome cocktail shakers, the characteristic triangular stemmed glasses, decorative cherry picks and

Cocktail cabinet in maple, 1935

lemon squeezers. While some flamboyantly flouted their purpose in modern styling or were jokey conversions of unlikely pieces such as grand pianos, others were discreetly disguised to match the style of the interior, fashioned in modern or reproduction styles. Cabinets designed for the purpose could disguise their function discreetly behind closed doors or announce it in different ways. Hosts could enjoy orchestrating the opening of the “bar” at an opportune moment to reveal an illuminated peach mirrored interior in its full chrome and cut-glass glory. Some versions included gadgets that slid an inside section into view as a flap was lowered providing a glass topped “bar” to mix the drinks, imitating in miniature the dramatic effect of the cinema organ rising from the pit.

The cocktail cabinet was reintroduced in a new form in the 1950s following the austerity period after World War II when nothing but the most functional furniture was produced. As soon as a competitive market reappeared and once the relaxation of design restrictions would allow, the furniture industry looked for new “selling points” to attract the popular market. As a result a small version of a cocktail cabinet was integrated with the sideboard to become a standard part of the dining set. More often than not the cabinet remained empty because people couldn’t afford to keep it stocked with drinks or preferred to go to the pub for a drink. Nevertheless it alluded to a glamour consumed through the cinema but not previously

made available for inclusion in the working-class home. With the growing popularity of DIY (do-it-yourself), Spanish holidays, the availability of plastic coated laminates and quilted leatherette, the built-in cocktail bar became a fixture in many 1950s and 1960s living rooms.

The recent revival of cocktail bars and drinks has been for consumption in public and has not stimulated the production of a new type of domestic cocktail cabinet, with the consequence that it now remains a period piece.

Codman, Ogden, Jr. 1863–1951

American architect and interior decorator

Ogden Codman, Jr. was one of the most prestigious American interior designers of his generation. His clients included some of the wealthiest and most influential East Coast families of the time and his name has become closely associated with what has been termed the opulence of the “gilded age” of decoration. He was also an important arbiter of taste and together with the author and society hostess Edith Wharton he wrote *The Decoration of Houses* (1897) which was the model for many subsequent primers on interior design. The dominant influences on his work were historical, and he borrowed freely from 18th-century French, English and American styles. His interiors were light and informally elegant, and featured white painted panelling, simple flowered fabrics and cream-coloured antique furniture. At a time when the dominant fashion was for over-elaboration and density in both decoration and furnishings, this style was classically simple and restrained.

Codman had already established a reputation as an architect and decorator among an élite clientele when he collaborated with Wharton on *The Decoration of Houses*. The two had met in 1893 when Mrs. Wharton (as he always addressed her) hired him to update the interiors of her seaside cottage, Land’s End, in Newport, Rhode Island. Codman, who was born into an old Boston family, was in his mid-thirties and was

Codman: drawing room of his own house, 7 East 96th Street, New York, 1912

already worldly and sophisticated, having spent his adolescence in Europe. Upon his return, he lived with John Hubbard Sturgis, a Boston-area architect who was also his uncle and, as the designer of Land's End, may have provided his nephew with an introduction to Wharton. Codman also studied a number of 18th-century American houses, including his ancestral home outside of Boston, The Grange, which he would later remodel and redecorate. To this informal education in architecture, he added a year of study at the Massachusetts Institute of Technology school of architecture and an apprenticeship with two architectural firms. In a sense, this was a typical architectural education for his era, mixing formal institutional study with the older traditions of apprenticeship and first-hand, observational knowledge. He was able to open his first office in Boston by 1891 and followed with New York and Newport offices in 1893. The range of European and early American references which he gained during these years stayed with him in all his design work and is clearly reflected in his collaboration with Wharton who had similar sensibilities about weaving American and European influences into her life.

Over the next two decades, Codman went on to build or remodel several dozen residences in Boston, Newport, New York, Washington, and Providence, but he was never fully accepted into the first rank of architects. Instead, his lasting impact emanates from his notable interior design work, such as the ten bedrooms for Cornelius Vanderbilt II at The Breakers, Newport (1895), the interiors for John D. Rockefeller's Kykuit, Pocantico Hills, New York (1908), the Martha Codman House, Berkeley Villa, Newport (1910), and the Archer M. Huntington House, New York 1913–15 – for the last two of which he also designed the building – and several collaborations with Elsie de Wolfe between 1910 and 1920.

These designs reflect the assumptions and precepts presented as a design philosophy to a broader public in *The Decoration of Houses*: a call for decoration that is simple and structural, creating a harmonious unity while simultaneously referencing selected historical styles of American and European houses of the 16th, 17th, and 18th centuries. The book is nothing short of a primer, with every interior element addressed in short chapters ranging from rooms in general, to

walls, doors, windows, fireplaces, entrances, halls, stairs, special function rooms and even a section on “bric-a-brac”.

It is tempting to consider Codman's and Wharton's principles as a proto-modern aesthetic: an insistence that houses are “mechanisms for living”, that “the supreme excellence is simplicity” and that architecture and interior design should be unified, but to do so misses the essence of their generation. For over twenty years, interior decoration in America had meant domestic trappings of mass-produced items ranging from rugs and draperies to ornamental china, statues, oriental motifs with Colonial Revival furniture, much if not all of which was given popular credence by the displays of 1876 Centennial Fair in Philadelphia. Wharton called other interior designers “upholsterers” who “crammed every room with curtains, lambrequins, jardinières of artificial plants, wobbly velvet covered tables littered with silver gew-gaws, and festoons of lace on mantle pieces and dressing tables”. Both Codman and Wharton, helped sweep away this vision by encouraging an aesthetic of simplicity and restraint as good taste, of interior design as “appropriate” to the sense of the building, its functions and its owners. Much of what they proclaim, with great authority, as “good design” must be seen as an antidote to this earlier idiom. While they professed to be addressing a broad American public, the tone and examples employed clearly articulated their vision for a late 19th-century wealthy lifestyle whose social customs and large staffs were waning by the early years of the modern era. This new aesthetic would reach a mass audience only through the trickle-down effects of followers and popularizations over the next few decades. Toward the end of his life, Codman gave a major archive of his office papers and drawings to the Metropolitan Museum of Art in New York and his substantial catalogue raisonné of French châteaux – which encompasses 36,000 photographs and 400 notebooks – to the French Ministry of Cultural Affairs.

By 1920, Codman, who had made numerous trips to Europe to procure furnishings for his clients, closed his New York office and returned to live out his life in France. As if to sum up his life, he designed and built a grand château, La Leopolda, near Villefranche (1929–31), combining aspects of Italian and French house and garden design, quoting historical motifs, and employing a sense of classical order and proportion that were the hallmark of his career.

While it has never been entirely clear what role each played in the writing of *The Decoration of Houses*, 25 years later Codman remembered that he did the work and Wharton just “polished” the sentences. While they did not always agree on issues of design (she once referred to one of his buildings as a “mud hut”), they maintained a correspondence into the 1930s when they lived only 80 miles apart as expatriates in southern France. Whatever their individual contributions, the book remained a standard text for the next 40 years, only succumbing to the change in lifestyles and means of production that occurred after World War II.

Biography

Born in Boston, 19 January 1863. Educated in Dinard, France, where his family lived from 1874–84; returned to America in 1882; studied

architecture at the Massachusetts Institute of Technology, Cambridge, 1883–84. Married Leila Howard Griswold, 1904. Apprenticed to various Boston architectural firms, including Andrews, Jacques and Ranton, 1886–87; practised independently in Boston as an architect and interior decorator from 1891; opened a New York office in 1893 and moved to New York permanently shortly thereafter. Published *The Decoration of Houses* with Edith Wharton, 1897. Executed many architectural projects and commissions for interiors during the 1890s and early 1900s. Closed the New York office in 1920 and spent the remainder of his life in France. Died at the Château de Grégy, Brie-Comte-Robert, near Paris, 8 January 1951.

Selected Works

Codman's personal papers, early architectural drawings, and family records are in the Codman Family Manuscripts Collection, Society for the Preservation of New England Antiquities, Boston. Business records, later architectural drawings and records are in the Department of Prints and Photographs, Metropolitan Museum of Art, New York. Other architectural plans and drawings are in the Avery Library, Columbia University, New York, and additional archival material is in the Ogden Codman Manuscript Collection, Boston Athenaeum.

Coffee Tables

The coffee table is emblematic of the rise of popular modern styling in the mid-20th century domestic interior. The feature that most distinguished a typical "coffee table" from the more generic "occasional" table, apart from its larger size and lower height, was the conspicuousness of its central position in front of easy chairs and settees, forming the nucleus of the sitting area. During the height of its popularity its most common form was rectangular and low, echoing the horizontal emphasis of modern architecture. Just as the cocktail cabinet was the set-piece denoting modernity and sociability in the 1930s suburban house, the coffee table was its equivalent in the 1950s "Contemporary" idiom of domestic decor.

It has been claimed that the coffee table was an American invention. Its popularity in the United States may in part be explained by the adoption of a less formal open-plan lifestyle where it formed the focus of the living room and replaced the dining table for informal eating in front of the television.

By the mid-1940s, among the more progressive style-conscious American furniture manufacturers, the coffee table had become a vehicle for novel and experimental designs. The sculptor Isamu Noguchi's version designed for the Herman Miller Company was clearly intended to give an abstract aesthetic dimension to the modern interior. With its asymmetrical carved wood base and heavy plate glass amorphous top, it clearly set out to transcend mere furniture and make its presence felt as a piece of sculpture. In contrast, Charles Eames's 1946 moulded plywood range of coffee tables were rather like large trays on legs and the ultimate in functionalism. Both his and Noguchi's designs were displayed at the Museum of

Modern Art (MOMA) in New York in 1946, which thus acknowledged the coffee table as a modern furniture type and securing a place for these tables as design classics of the Modern Movement.

Popular American versions appeared in geometric as well as the organic free-forms translated from abstract modern art, and in every imaginable shape from boomerangs, amoebas, kidneys, and blobs, to guitars and artists' palettes. It is not surprising that the exuberant variety of its popular forms should have been condemned as excessive by Edgar Kaufmann, American "good design" guru and Director of MOMA. In the conclusion to *What is Modern Interior Design?*, one of a series of didactic MOMA publications he wrote in 1952, Kaufmann exemplified the perfect interior as one in which: "We see no fur throws, no free-form coffee tables".

In Britain the craze for coffee bars and Italian cappuccino coffee coincided with the popularization of the coffee table during the 1950s, though it had started to appear in a variety of guises and versions much earlier on in the period immediately following World War II. Firms that could not get the necessary permits or materials to manufacture furniture while timber was in short supply from 1945, were eased back into peace-time production by being allowed a "Fancy Goods and Domestic Equipment" licence. This permitted them to make small items such as trays and mirrors which only required modest quantities of timber. With the addition of thin, spindly legs using a minimum amount of wood "off-cuts" and waste, a tray could become a small table. The firm of David Joel produced just such an item with a glass top displaying a souvenir map of the American landings in Normandy, and called it a "coffee table" hoping to appeal to the American market.

Another early example, was the *Cloud Table*, designed by Neil Morris and produced by H. Morris and Co. of Glasgow from 1946, exploiting the design possibilities of plywood. It consisted of an abstract amoeba-shaped top faced in walnut on turned tapered legs. An ornamental striped effect was obtained by the bevelled edge exposing the natural colours of the contrasting wood laminations. Morris also designed the *Long John* which came complete with a foam rubber cushion so that it could be adapted from a coffee table to a low bench.

Other early British versions of coffee tables in the "Contemporary" style selected from the Council of Industrial Design's Index of approved designs, appeared in 1952 in Noel Carrington's *Design and Decoration in the Home*, claiming to be the first survey of interior design after the restrictions of the Utility Period. Apart from a rather restrained "boomerang"-shaped table designed by A.M. Lewis for Liberty, it also featured a "nest of coffee tables" designed by Hulme Chadwick for Frank W. Clifford Ltd. Although in style these small tables were presented as the new fashionable "coffee table" type with their brass-tipped tapered "toothpick" legs, the fact they appeared in a "nest" suggests an adaptation of a traditional form. It was occasional tables that habitually came in sets; while the coffee table was essentially a single piece. The concept of suites of furniture conformed to a more traditional pattern of furnishing where the nest of occasional tables was positioned discreetly, strategically but unobtrusively stowed away against a wall or alongside an easy chair to be brought out when needed for perching tea cups or ash trays. The more

typical coffee table demanded attention and defined the centre “hot” spot of the room – the focus of social conviviality, leisure and relaxation.

The first G-Plan catalogue produced by Gomme of High Wycombe in 1954 included a transitional coffee table, significantly labelled a “cocktail table” and accessorized with a typical 1930s chrome cocktail shaker and triangular stemmed glasses. Its revolutionary break from tradition offering single “units” rather than complete sets and suites of furniture, aimed at the younger, more fashion-conscious generation proved to be very popular.

Hille was another, among the more up-market firms, to break from tradition in the post-war period and go on to produce avant-garde design. Their designer Robin Day, who distinguished himself by winning a MOMA competition in 1949, was responsible for some of the most forward-looking developments in English furniture design during the 1950s and 1960s. Day turned out a number of coffee table designs for Hille, in a variety of geometric forms from triangles to ovals, using moulded plywood and highly figured veneers on simple inset timber or metal-rod legs.

By the mid-1950s the coffee table had become a standard item of furniture in the British domestic interior. Its presence marked the notional centre point of the seating area, suggesting conversation and social interaction rather than the more introverted and traditional arrangement of easy chairs radiating around the fireplace. During the 1960s when central heating took over from the fireplace, it was the coffee table that almost replaced the hearth as the altar to domesticity. It defined the room as “Contemporary” and provided a space for the display of the accoutrements of ideal modern home living, style awareness and leisure through the display of items such as coasters, “coffee table books”, exotic house plants, statuettes and ornaments.

The symptomatic nature of the coffee table, which made it a signifier of modernity in the domestic landscape, was evident in its appearance as one of the central motifs of the “Homemaker” dinner service brought out by Ridgway Potteries in 1955. With its striking surface pattern of black on white featuring a boomerang coffee table with black tapered legs, “Homemaker” proved popular enough to continue to be sold by Woolworths until 1967 and has since become a mid-century period icon among collectors.

Alongside the consumption of modern style furniture, period and reproduction furniture has continued to be popular in Britain to the present day. Although the coffee table is strictly a modern type-form, it has been adapted to match in with reproduction style furniture, acquiring in the process such travesties as cabriole legs and “antique” finishes. Among the many hybrids, one of the more recent is the stripped pine “genuine antique” coffee table made out of old kitchen tables with cut down legs, which have in turn been reproduced. Although no longer at the forefront of furnishing fashion, coffee tables continue to be popular items in today’s domestic interiors.

Colefax & Fowler

British interior decorators; established 1934

Colefax & Fowler is one of the foremost British interior decorating firms of the 20th century and their work has had a significant impact on many other designers and manufacturers in the post-war period. The company’s style was strongly influenced by three figures: Sybil (or Sibyl) Colefax, Nancy Lancaster, and the decorator John Fowler. Together, they created a distinctive house style that has since become synonymous with the English Country House style. This style combined a respect for tradition with an emphasis upon comfort and simplicity, and by adapting the choicest elements from the decorative styles of the past – predominantly the 18th and early 19th centuries – its exponents sought to create an ambience of gracious and timeless elegance. Several other firms have also promoted this style but none as successfully as Colefax & Fowler; their work has come to epitomise the best of English taste and enjoys a reputation for quality and discernment worldwide.

The origins of the company date back to 1933 when the society hostess, Sybil Colefax embarked upon a career as a “lady decorator among friends” in collaboration with certain Bruton Street antique dealers. In this respect, Colefax was following the example set by Elsie de Wolfe in New York. De Wolfe had played a pioneering role in promoting the involvement of women in the world of interior decoration by establishing herself as the first professional female decorator in the period leading up to World War I. Like de Wolfe, Colefax courted clients from the upper echelons of society and entertained many of London’s fashionable and intellectual elite at Argyll House, her home in Chelsea. Cecil Beaton described her drawing room in his book *The Glass of Fashion* (1954), noting the use of pale, mixed colours such as almond, light green, grey and opaque yellow, and admiring its simplicity and attention to detail.

In 1934, Sybil founded Colefax & Co. with premises at 29 Bruton Street, and the company gained in stature with the arrival of the promising young decorator John Fowler in 1938. Having trained as a decorative painter, Fowler had run the painting studio of the home furnishings section of the department store Peter Jones from 1931, before establishing his own

Colefax & Fowler: Nancy Lancaster's living room, Haseley Court, Oxfordshire, c.1959

business in premises in Chelsea in 1934. In contrast with the Modernist aesthetic of the 1930s, Fowler's personal style was characterized by simplicity and an eye for period furniture which had been sharpened during his association with the antique dealer Margaret Kunzer. He endorsed the use of traditional English furnishing materials such as Norfolk rush matting and striped cottons, and he also had a liking for the Toiles de Jouy printed cottons from France. In describing his work, he adopted the expression "pleasing decay" which was coined by John Piper in the *Architectural Review* of 1947, and commissions included schemes at Blenheim for the Duchess of Marlborough.

In 1944 the company moved to larger premises at 39 Brook Street – the house designed and owned by the 19th-century British architect Sir Jeffry Wyattville. Sybil Colefax retired due to illness and the financially ailing company was bought by Ronald Tree as a parting gift for his wife Nancy, the future Mrs. Lancaster, after their divorce. The American-born Nancy Lancaster acknowledged the importance of the role played by the company's principal decorator by revising the firm's name to Colefax & Fowler, and in 1950 the two began the creative professional partnership which consolidated the company's house style.

Described as "the unhappiest unmarried couple in England", Lancaster and Fowler had quite different, but complementary approaches to interior design. Brought up in the American South, Nancy had no patience with the painful formality and inconvenience of English aristocratic life and she introduced the concept of comfortable living into England in the two stately homes – Kelmarsh in Northamptonshire, and Ditchley Park in Oxfordshire – that she and Ronald Tree had occupied. She also had a strong dislike for showy sumptuousness and she used fresh colours to emphasise architectural features and faded fabrics and furniture to create a mood of timelessness and casual elegance. Frequently, the furnishings were left to fade naturally in sunlight but in some cases, the ageing of fabrics was precipitated by dyeing them in tea. Into this classic period environment were integrated the comforts of modern services and she created connecting bathrooms which were carpeted and furnished as extensions of the bedroom. Her drawing rooms at Ditchley, Haseley and her London flat in Avery Row became showpieces for the Colefax & Fowler style, mixing grandeur and elegance with understatement and comfort.

The emphasis on understatement in Lancaster's work countered the more flamboyant aspects of Fowler's work. Fowler's

decorative schemes of the 1950s were founded on his sense of colour and on his instinctive balancing of contrasts, of pattern, texture and scale. Thus, he avoided co-ordinating colour schemes and relied instead on juxtapositions of related tones. His palette consisted of distinctive yellows, blues, pinks, apricots and natural greens, and he mixed large-scale floral designs with sprig patterns, checks and stripes. Fabrics played an especially important role in his interiors, and curtains, pelmets and upholstery were often treated extravagantly. An early predilection for the Regency style resulted in the use of generously swagged pelmets hung from exaggeratedly large poles, while his enthusiasm for the Baroque-style draperies illustrated in the 17th-century interiors engraved by Daniel Marot broadened his repertory of curtain treatments and informed his use of decorative braids, fringes and tassels to emphasise form. Fowler's work has sometimes been likened to that of a couturier, especially in its attention to detail, and his friendship with the society dress designer Hardy Amies may well have influenced features such as his use of contrasting piping, his fondness for pleating and gathering in upholstery and on straight-sided lampshades, and his technique of covering round tables with fabrics that fell in loose folds down to the floor. His strong sense of pattern also informed his interest in picture-hanging and his formula of arranging pictures in symmetrical groupings with the frames suspended by decorative cords from rosettes, bows and tassels has been repeated in numerous other decorators's schemes. The inspiration for his work lay in the past, many of the motifs for his fabrics and wallpapers were taken from period samples found in the houses he was decorating. He described himself not as a designer but as an "architectural decorator", and if his approach to history was sometimes more intuitive than archaeological, it nevertheless proved enormously appealing and strongly influenced later attitudes to decoration and period styles.

The novelty of Colefax & Fowler's approach lay in their ability to enhance period features, while at the same time adapting them to suit the greater informality of contemporary lifestyles. This approach quickly found favour with the English aristocracy, and the firm's clientele included many wealthy and titled customers who occupied historic houses themselves and who were eager to preserve their heritage. Among their more prestigious commissions were Daylesford, Wilton, Tynningham and Chequers, and the decoration of the Audience Room at Buckingham Palace.

Fowler's knowledge of and sensitivity to period styles also attracted the attention of the National Trust and from the late 1950s he became increasingly involved, on a personal basis, with the restoration of interiors in their care. His work at Clandon, Surrey, from 1968, represents one of the most comprehensive schemes with which he was associated and illustrates his concern to capture the feeling of the room in the period to which it was restored, even if this was sometimes at the expense of historical accuracy. Thus, in the Saloon at Clandon, he added a third shade of blue to complement the two original tones uncovered in paint-scrapes, and the overmantel was marbleised to match the fireplace. Such "improvements" would clearly be unacceptable to purists today, but Fowler's work nevertheless did much to foster new standards of professionalism within the Trust and encouraged the use of skilled craftsmen and firms with long traditions of specialist

work. Moreover, his frequent use of paint-scrapes foreshadowed the more scientific investigation of historic colours developed by Trust consultants such as Ian Bristow, while Fowler's emphasis upon the importance of historic lifestyles has strongly influenced the studies of "authentic decor" pioneered by the scholar Peter Thornton. From 1969, following his retirement from Colefax & Fowler, Fowler's energies were exclusively devoted to assisting the Trust. He worked on more than 25 of their houses and his book, *English Decoration in the 18th Century*, written with John Cornforth and published in 1974 (revised 1978), represents a summary of his long experience in this sphere and remains a standard textbook on historic interiors and design.

John Fowler died in 1977 but Colefax & Fowler has remained remarkably true to the spirit of his style. Now run by Tom Parr, who has been chairman since 1960, the company has built up an important archive of designs for wallpapers, fabrics and trimmings gathered from previous commissions. Many of these are now manufactured commercially, and Fowler's *Old Rose* pattern is one of their best-selling chintzes. Historical sources also remain the key to the new collections of designs which include the adaptation of period wallpapers from the archives of the Musée des Arts Décoratifs, Paris. However, the company's market has broadened considerably, and having started out as a small partnership offering a professional decorating service to an exclusive elite, its commissions now include jets and yachts as well as large town and country houses. And it provides an increasing number of textiles and wallpapers for sale to a wider public in its retail outlets in England and abroad.

In recent years, Colefax & Fowler has continued to expand. With three showrooms in London, they also have outlets in New York, Paris, and Sydney. The company was floated on the London Stock Exchange in 1988, and a year later it acquired Jane Churchill, a more commercial producer of traditional-style designs, and Kingcome Sofas, the manufacturer of upholstered seating.

The crisp sprigged wallpapers, floral chintzes and blue and gold floral carpets that exemplify Colefax & Fowler's work have been copied by many other manufacturers and designers and the company has spawned many imitators. The influence of Fowler himself resonates in the work of those who were closely associated with him in the 1950s, including that of the decorators Nina Campbell in London, and Mario Buatta and Keith Irvine in New York. Indeed, Colefax & Fowler has been particularly successful in America and their style is acknowledged in numerous interiors by East Coast decorators such as Mark Hampton and David Easton that have responded to their clients' nostalgia for an ennobling past. But the company has also been influential in more commercial spheres. Features such as elaborate curtain treatments, flounced lampshades and tablecloths, and ubiquitous chintz and sprig designs are now widely available from firms like Laura Ashley, and cheaper, mass-produced versions of the Colefax & Fowler house style are a familiar sight in many urban professionals' homes.

Colombo, Joe 1930–1971

Italian painter, architect, sculptor and designer

Joe Colombo was one of Italy's foremost modern designers. Trained as an artist at the Accademia di Belle Arti di Brera, and subsequently as an architect at the Politecnico di Milan, he was initially active as an avant-garde painter and sculptor, joining the fine art group Movimento Nucleare, and the Concrete art movement between 1951 and 1954. He later worked as a designer of both furniture and interiors. Bold and innovative, his designs were simple, flexible, brightly coloured, functional and appropriately futuristic for the times. His work was highly regarded by both critics and other design professionals, and was notable for its uncompromising modernity, its use of new materials, especially plastics, and for its development of modular and mass-produced living units.

Colombo became interested in furniture, lighting and interior design in the early 1960s. He had already been working as an architect for several years and it was no doubt his experience of working on the interiors of buildings that prompted his involvement in design. This involvement also gave him an opportunity to experiment with new materials and to put into practice his ideas about the domestic environment. Accordingly, he opened his own office in Milan in 1961 and worked as a freelance designer for a number of progressive furniture manufacturers including La Linea and La Rinascente, lighting companies such as O'Luca, and the specialist plastics firm, Kartell and Bayer Plastics. Success was not long in

Colombo: Total Furnishing Unit, 1972, comprising four units: kitchen, bathroom, cupboard and bed-and-privacy unit; shown at the exhibition *Italy: The New Domestic Landscape*, Museum of Modern Art, New York

coming. In 1963 he received an award from the Italian National Institute of Architecture for his interiors for the Hotel Pontinental in Sardinia, and in 1967 the New York department store, Gimbel's, held a special Joe Colombo week promoting some of his most popular works. These included his ergonomic series of *Universale* chairs which had injection-moulded plastic seats and adjustable legs to suit both adults and children, and his *Spider* light which was the first lamp to use the halogen bulb for non-industrial purposes.

Colombo's background in sculpture clearly influenced his approach to furniture design and encouraged experiments that were to revolutionize the function and appearance of furniture in the 1960s. His *Tube* chair of 1970, for example, transcended traditional ideas of what a chair should be and blurred the distinctions between furniture and sculpture. It consisted of four tubes that could either be clipped together, or rolled inside one another, to modify the arrangement of seating or for storage. It was made of white plastic polyurethane and had mustard acrylic upholstery.

It was Colombo's championing of new materials such as injection-moulded plastics and plastic laminates that was especially influential. The historian Penny Sparke has described the impact that this had on Italian furniture design: "The shiny surfaces and voluptuous curves they [Colombo's furniture] created symbolically transformed plastic from a cheap into a luxury material, and earned [Italy] a reputation as the first country to find a truly modern idiom. No longer was it merely an imitation of other more expensive materials, but one with its own seductive aesthetic – determined for the most part by its own production process" (Sparke, 1988). By way of example, she illustrates the ABS stacking chair, designed for Kartell in 1965. The bright emerald green colour and sleek

contours of this chair denote both modernity and sophistication. Furthermore, the form has been shaped by its production; the hole in the back which gives the chair its distinctive appearance is also essential to the release of each chair in the vacuum-forming process.

From the late 1960s Colombo became interested in new concepts of domestic organisation. In collaboration with the designer Ignazia Favata, he developed a system of co-ordinated, flexible structures, composed of four mobile units – “Kitchen”, “Cupboard”, “Bed and Privacy” and “Bathroom” – which created a “total” living environment. Based on space travel research, these units were intended to meet every domestic need and although the appearance of the individual components seems somewhat futuristic today, the overall concept was undeniably practical. A version of this system was installed in Colombo’s own apartment in Milan, and his experiments culminated in the “Rotoliving Unit” exhibited posthumously at the Museum of Modern Art’s exhibition, *Italy: The New Domestic Landscape*, held in New York in 1972. By this time, Colombo’s interest in individual furnishings and plastics had been replaced by a concern with the utopian, humanistic needs of environmental design that examined what he perceived as three key relationships: that between the city and the dwelling unit, between green spaces and the dwelling unit and between the dwelling unit and man.

Design could never therefore exist in a vacuum. Its social and technological roles were always of paramount importance, and in his work for interiors Colombo was determined to achieve the most effective use of materials to create objects that could be mass-produced without aesthetic compromise. His work was never simply decorative, and right up to his untimely death at the age of 41, he strove to make his designs relevant to the age in which he lived.

JANICE WEST

Biography

Born Cesare Colombo, in Milan, 30 July 1930. Studied painting at the Accademia di Belle Arti di Brera, to 1949; studied architecture at the Politecnico di Milan, 1950–54. Active as a painter and sculptor, Milan, 1950–55; joined the Movimento Nucleare (founded by Enrico Baj and Sergio Dangelo 1951); founder-member, Arte Concreta group, Milan, 1955. Took over the family electrical equipment business, 1959; ran his own design office, Milan, 1962–71. Designed furnishings, lighting, ceramics and electrical appliances for many firms including Arflex, Elco, Kartell, O’Luce, La Rinascente, Candy and Zanotta. Exhibited at numerous national and international exhibitions including the Milan Triennale 1954, 1964 and 1967, and Museum of Modern Art, New York, 1972. Received many awards including: IN/ARCH Award, National Institute of Architecture, Rome, 1963; Silver Medal, Milan Triennale, 1964 and 1967; Compasso d’Oro, Milan, 1967; Association of Industrial Designers Award, New York, 1968. Died in Milan, 30 July 1971.

Selected Works

The Joe Colombo Archive, containing designs, correspondence and business records, is in the Joe Colombo Studio, Milan. Collections of Colombo’s furniture and lighting are in the Stedelijk Museum, Amsterdam, and the Metropolitan Museum and Museum of Modern Art, New York.

- 1963 Hotel Pontinental, Golfo dell’Asinara, Sardinia (interiors and furniture)
- 1964 *Elda* 1005 Easy Chair: Comfort

- 1965 *Spider* Lamp: O’Luce
- 1966 *Supercomfort* 1000 Easy Chair: Comfort
- 1966–67 Magnetic Furniture System: La Rinascente
- 1967 *Universale* Seating: La Rinascente
- 1967–68 *Box* 1, combined bedroom / study / living room furniture unit: La Linea
- 1968 Eurodomus Exhibition, Turin (display stand and furniture)
- 1970 *Tube* Chair: Zanotta
- 1971–72 *Total Furnishing Unit* (“Rotoliving Unit”) Museum of Modern Art, New York (exhibition display and furniture)

Colonial Revival

The colonial past and the tradition of colonial design have exerted a strong and persistent influence on American society since the War of Independence. During the late 19th and early 20th centuries, however, that historical awareness dramatically increased. In a style now defined as Colonial Revival, designs from the 17th and 18th centuries, as well as those from the Federal era, were revisited, reproduced, and adapted for modern life.

The origins of the Colonial Revival rested in the economic change and social upheaval of the 19th century. Many Americans worried that the nation heroically created by the Founding Fathers was in a state of decay. Industrialization, immigration, and the moral crisis of the Civil War all threatened the established order and national sense of identity. The Colonial Revival represented a material response to these changes, and reflected a longing for the security and simplicity of an idealized past.

One of the earliest manifestations of the Colonial Revival was a campaign begun in the 1850s to restore George Washington's home, Mount Vernon. The Colonial Revival expressed tremendous reverence for the leaders of the Revolution, and great value was assigned to places they knew and objects they used. Tourists connected with the spirit of the Founding Fathers by visiting their homes, and taking part in a more virtuous past made palpable in honest, hand-crafted surroundings.

In its association of morality with handcraftsmanship, the Colonial Revival may be seen as part of the Arts and Crafts movement. The colonial era was lauded as a time of artisans' pride in their independent creation; objects made by colonial craftsmen came to symbolize the dedication and democratic fervor of their time. Colonial designs became prescriptions for moral living, purifying and elevating everyday life through a connection to America's exalted youth. The evils of modern, industrial life could be reformed by recreating the domestic environment of the past.

Furthermore, new immigrants could be taught America's history and democratic values by visiting restored colonial homes. In the 1920s museums across the country opened permanent exhibitions of Americana – the Metropolitan Museum in New York, for example, opened its American wing in November 1924 with displays of early furniture – and promoted the artistic, historic, and didactic value of their collections. Colonial objects were tools for creating a shared national culture, helping assimilate visitors into the American tradition.

The International Centennial Exposition in Philadelphia in 1876 helped to spread the popularity of the Colonial Revival. Exhibitions included the New England Farmer's Home with "colonial kitchen," a display that purported to represent early American domestic life. Costumed guides led throngs of visitors through an interior including a hearth, settle, spinning wheels, and furniture with historical associations. The colonial kitchen was juxtaposed with a Modern Kitchen, which attracted relatively little notice. Indeed, the Colonial Revival may be seen as a reaction against Victorian household goods. Critics dismissed modern furnishings as fussy, poorly-made copies of European designs. Historical eclecticism was condemned, and Americans were urged to decorate in an indigenous style suited to their colonial heritage.

Clarence Cook, a leading proponent of the Household Art movement, praised the simplicity and usefulness of colonial furniture, and his *The House Beautiful* (1878) contained a view of Charles McKim's restoration of the 18th-century Robinson house kitchen in Newport, Rhode Island. The Robinson kitchen featured a Chippendale mirror, William and Mary caned armchair, Windsor chair, and enormous fireplace surrounded by tiles over a brick hearth. McKim was an early advocate of colonial architecture, and with his partners William Rutherford Mead and Stanford White, a leading proponent of the Shingle Style. An American adaptation of the English Queen Anne Style, the Shingle Style is closely allied to the Colonial Revival. Shingle Style houses were nostalgic, often using broad living halls, large chimneys, inglenooks, beamed ceilings, sash windows, and fanlights. Simplicity, amplitude, and a sense of comforting shelter characterized the Shingle Style and Colonial Revival architectural shell.

Hearths like that designed by Charles McKim became virtual icons of the Colonial Revival. Obsolete in an age of central heating, the open fireplace became the symbolic heart of the house. Its welcoming warmth and light created a sense of security and romance, an escape to a more simple time. Period literature described the fireplace as the family altar.

Other Colonial Revival objects assumed a heightened importance, including tall-case clocks and spinning wheels. "My Grandfather's Clock," an acclaimed song from 1876, helped popularize the outdated timepiece at the time of the Centennial. Its ponderous ticking and old-fashioned form evoked both present and past time. Similarly, the spinning wheel became a potent symbol of the past, and was virtually ubiquitous in the Colonial Revival house. Advocates of Household Art championed the spinning wheel. In *Stepping Stones to Happiness* (1897), Harriet Prescott Spofford promoted the "clear beauty" of the wheel, describing it as "a real object for an artist." The Daughters of the American Revolution, an elite genealogical society, adopted the spinning wheel as part of its insignia, reflecting its position that American women fought the Revolution by spinning and weaving homespun for their fighting men. Even fragments of the spinning wheel were valued, as shown by a group of armchairs manufactured in the 1880s from old spinning and flax wheels parts: flyers decorated the crestrails, wheels formed the backs, and trestles were incorporated into the legs.

Inevitably, as admiration for the Colonial period grew, new industries emerged to meet the demand for Colonial furnishings. Makers of colonial adaptations and reproductions, practitioners of colonial style handicrafts, and antiques dealers all profited from and disseminated the Colonial Revival. The earliest pieces of reproduction furniture date from the mid-century when, according to one contemporary observer, "Mayflower furniture [was] becoming common" (Rhoads, 1977). By the 1880s, the taste had become more widespread and a writer in the *Decorator and Furnisher* of November 1883 declared that "the Chippendale or Colonial Style is a favorite in new designs for interiors" and that it had ousted the fashion for Eastlake and Early English furnishings. By this date reproductions of colonial furniture were being produced across the country, from large midwestern factories like the Century Furniture Company of Grand Rapids, Michigan, to smaller shops like Sypher and Company, and Ernest Hagven of New York City. Among the best-known reproductions were those produced by Wallace Nutting Period Furniture of Framingham, Massachusetts.

Nutting, a retired Congregational minister and self-styled "poet-capitalist," championed the Colonial Revival. He collected rapaciously, and used antiques as models for his high-quality reproductions. His collection also appeared in photographs he produced of colonial interiors. The photographs were tremendously popular, and helped expose Americans to the precepts of Colonial Revival decoration. Nutting focused on the design and historical associations of early American furnishings rather than their means of production. However, other figures in the Colonial Revival combined their interest in colonial objects with a rediscovery of traditional handicrafts. Of particular note are the embroideries and furniture produced in Deerfield, Massachusetts. In 1896 local women established the Society of Blue and White Needlework.

They traveled through the Connecticut River Valley studying colonial embroidery, seeking to preserve and replicate the patterns and skills of the past. All the Society's embroidery initially was stitched with blue and white linen thread, yet soon other natural dyes were introduced. The success of the Society spurred the creation of the Deerfield Society of Arts and Crafts, which produced hand-crafted reproduction furniture. The blue and white of the Deerfield embroideries were typical of Colonial Revival color schemes; Colonial Revival decorators favored subdued tones, such as pale yellow, pearl gray, and the historically evocative "Williamsburg blue."

Unlike other passing fashions, the Colonial Revival did not fade away with the advent of the new century. It was still popular for much of the first two decades of the 20th century and although decorators like Elsie de Wolfe professed herself bored with the style in 1915, she nevertheless furnished some of the bedrooms in Stanford White's Colony Club with colonial reproductions. Modernist critics, however, were more categorically hostile. Lewis Mumford's *Sticks and Stones* (1924) attacked the style as inappropriately historicist, as did the champion of Modernism, Henry-Russell Hitchcock. But Colonial Revival has refused to disappear. It continues with great vitality, informing modern life, and fulfilling Americans' need to articulate a continuity with their past. It remains the most popular historical style in contemporary home decoration.

MADELINE SIEFKE ESTILL

Selected Collections

Examples of Colonial Revival furnishings and interior schemes can be viewed in the period rooms at the Winterthur Museum, Delaware, and Colonial Williamsburg, Virginia.

Colonna, Edward 1862-1948

German designer and decorator

Circumstances conspired to deprive Edward Colonna of his position as a pioneer in the development of the curvilinear Art Nouveau style. His seminal publication, *An Essay on Broom-Corn*, dating from 1887, a revolutionary booklet of meandering Art Nouveau designs produced while he was working in Dayton, Ohio, was in the style of modest, small-scale publication which had come to be associated with the Arts and Crafts Movement rather than with the international avant-garde with which Art Nouveau was to be identified. And almost at once nearly the entire stock of booklets was destroyed in a fire in the storage warehouse. Colonna's wavy, interlaced designs are inspired by the stalks of corn used to make a corn-broom (a besom or rustic farmyard broom). Strongly reminiscent of the designs of Louis Sullivan, the Chicago architect, the booklet predates experimental work of a very similar kind by architects in Belgium like Victor Horta and Henry van de Velde. Colonna's ideas seem to have inspired the "Broomcorn" table silver designed for Tiffany & Co. by T. Curran in 1890. Colonna was to remain essentially faithful to this organic curvilinear inspiration throughout the greater part of his career, only turning to a modified geometric manner in keeping with French Art Deco in the 1920s.

Errors of biographical information in the Paris Salon catalogues even deprived Colonna of his true nationality and it was only with the series of articles published by Martin Eidelberg in the late 1970s that the details of his life and career were unearthed. Colonna was born near Cologne in Germany, and after architectural studies in Brussels, which he commenced at the very early age of 15, he went to New York at the age of 20 to work in Louis Comfort Tiffany's decorating company Associated Artists. In 1885 he was appointed chief designer at the Barney & Smith Manufacturing Company, a factory making railway wagons in Dayton, Ohio. From there he went to Montreal, where he set up his own studio and supplied railway wagon designs for the Canadian Pacific Railway. It was towards the end of his period in Montreal that he made his first jewellery.

Meanwhile the great entrepreneur Siegfried Bing (German-born but by now established in Paris) was investigating American decorative art for his book, *Artistic America*, which was published to coincide with the opening in 1895 of his Parisian gallery. The famous Maison de l'Art Nouveau at 22 rue de Provence was to give its name to the very movement with which Colonna's name is associated. Bing was already an admirer of Sullivan and Tiffany, and of Edward Moore, the inventive director of Tiffany & Co.; Colonna was among the rising young designers to be recruited by Bing for L'Art Nouveau, along with Eugène Gaillard and Georges de Feure.

For Bing, Colonna produced a flow of scintillating Art Nouveau designs. The metalwork and jewellery stand out as

notably controlled among the female heads and sinuous bodies with flowing hair and drapery from the more flamboyant of his contemporaries, for example, René Lalique and Georges Fouquet. The furniture mounts are exquisite jewel-like pieces, but still perfectly appropriate to their purpose. The same control is evident in the furniture, ceramics, wallpaper and textile designs. Colonna might start with a flower motif, but the development of his designs was always in the direction of complete abstraction.

Bing's venture was extensively reported in design and decoration periodicals and the display at the Paris Centennial Exhibition in 1900 was regarded as a triumph for the gallery and its designers. Colonna created a salon complete with furniture and all its decoration. Bing had urged him to "eschew the bulky, box-like forms of British and Belgian furniture and instead to apply a modern decorative vocabulary to the light, graceful forms of Louis XV", an acknowledgment of the Rococo inspiration that is at the heart of the Art Nouveau style.

After the celebrity of his Parisian career Colonna returned in about 1902 to obscurity in North America – from 1903 his work ceases to feature in decorative art publications – but he was very influential in America where he made silverware designs for leading Arts and Crafts-inspired manufacturers like Marcus & Co., confirmation of the duality of the *Broom-Corn* essay. In 1925 Colonna returned to France and settled in the south, where he spent his time in collecting and dealing and carving in alabaster. He died in Nice in 1948.

Colonna's work is well represented in museum collections (particularly the Musée des Arts Décoratifs in Paris), mainly by individual ceramics and metalwork. There is a strong emphasis on the jewellery, the area on which his modern reputation principally rests. A collection of his designs for jewellery is preserved in the Public Library in Newark, New Jersey. For his work as an interior designer it is best to consult the illustrations recording Bing's presence at the Paris 1900 exhibition, where the effect of the complete ensemble can be appreciated. Gabriel Weisberg's 1986 exhibition catalogue includes a full bibliography of these sources, and reproduces photographs of the salon from the Bing archive material in the library of the Musée des Arts Décoratifs. The bibliography also lists all of Martin Eidelberg's invaluable articles on Colonna.

CHARLOTTE GERE

See also Art Nouveau; Bing

Biography

Born Edouard Klönne in Müllheim, near Cologne, 27 May 1862, the son of a bookdealer. Studied architecture in Brussels, 1877–81. Moved to New York, 1882; worked with Louis Comfort Tiffany (1848–1933) 1883; worked with the architect Bruce Price, 1884–85; chief designer for Barney & Smith Manufacturing Company, Dayton, Ohio, 1885. Married Louise McLaughlin, daughter of the architect James McLaughlin, 1887. Moved to Montreal, 1888, and worked for the Canadian Pacific Railway. Active as a designer of furniture, decoration and textiles from the late 1880s. Moved to Europe, 1898, and worked for Siegfried Bing's L'Art Nouveau gallery, 1898–1903; designed furnishings for Bing, jewellery for Henri Vever, and ceramics for Gérard, Dufraisex & Abbot; returned to Canada, 1902, and worked as an interior decorator and antique dealer; returned to Europe 1908; moved back to New York, 1913. Settled in Nice, France, 1925, and worked sporadically as an antique dealer and

carver of alabasters but was increasingly confined to bed through ill health. Published an influential work, *Essay on Broom-Corn*, New York, 1887. Died in Nice, 14 October 1948.

Selected Works

An important collection of Colonna's designs, drawings, photographs, letters and personal memorabilia is in the Newark Museum and Library, New Jersey. Examples of Colonna's furniture and ceramics are in the Dayton Art Institute, Ohio. Additional items of ceramics and of jewellery are in the Musée des Arts Décoratifs, Paris, and examples of textiles are in the Museum of Applied Art, Vienna.

Interiors

- 1885–88 Barney & Smith Manufacturing Company (interiors of railway carriages)
- 1888–90 Canadian Pacific Railway (interiors of railway carriages)
- 1890 Van Horne House, Montreal (remodelling of interiors, including the main salon); William Van Horne
- 1900 Exposition Internationale, Paris (salon and music room for S. Bing's pavilion)
- 1903 King Edward Hotel, Toronto (decoration and furnishings)

Commodes

According to Thomas Sheraton, who defined the commode in his *Cabinet Dictionary* of 1803, the word was "from the French and signifies a woman's head dress. In cabinet making it applies to [a] piece of furniture chiefly for ornament, and to stand under a glass in a drawing room ... It is sometimes used more agreeably to its derivation, and signifies such commodos as are used by ladies to dress at, in which there is a drawer

Commodes: Thomas Sheraton design for a commode, 1794

fitted up with suitable conveniencies for the purpose" His definition captures the merging of functional and decorative purpose that this piece was devised to serve.

Like all storage units, the commode is based on the coffer, or trunk. Its development can be traced to the late 16th century, when English and Continental cabinet-makers developed the chest-of-drawers by approaching the box from the front rather than the top, and dividing its volume into accessible units held in place by runners or plates. In France, their *commodité*, or convenience, was not recognized linguistically until the early 18th century. The oldest French reference dates to 1708, when the Duc d'Antin mentioned that he had seen two commodes that Guillemart was making for the king's bedroom at Marly, and that each cost 310 *livres*. The name took some time to catch on. Writing a letter about presents given at court in 1718, the Duchesse d'Orléans felt constrained to tell a friend that, "A commode is a big table with big drawers [and] beautiful decorations." An object that so combined beauty and function was irresistible, however; by 1740, commodes were as popular with the bourgeoisie as with the nobility.

This development coincided with the rise of the curvilinear Rococo, and the revolution in form sparked new construction methods. As forms became increasingly plastic, cabinet-makers

often found it necessary to commission scale models from a sculptor. Templates cut to conform to the model were laid along the fronts and sides of the piece as it was carved from the plank, to ensure that the complex curves of these areas would be bilaterally identical.

These techniques allowed such innovative cabinet-makers as Antoine Gaudreau and Charles Cressent to transform the commode's appearance. Marble tops became standard. Legs were lengthened and curved, straight fronts and sides made parabolic. Drawers concealed the frame that held them in place. The number of full-length drawers rarely exceeded two, half-width drawers disappeared, and drawers could be concealed by doors. Most important, fronts were decorated as unbroken areas, covered with floral marquetry in exotic woods, and overlaid with interlacing ormolu arabesques.

By 1745, decoration had overtaken function. Moved from the bedroom to the salon, the commode was generally surmounted by a mirror, and used to balance the mass of the fireplace and mirrored overmantel. When straight lines returned in the Neo-Classical Louis XVI period, commodes were sometimes combined with *encoignures* (corner cabinets), and given convex ends. At the same time, the façade was typically arranged in three vertical sections of geometric marquetry outlined with ormolu or brass moulding, drawers were

concealed behind doors, and the piece was brought lower to the floor.

Although England had had the chest-of-drawers since the late 16th century – Lawrence Abelle had built a “cubborde of boxes” in Stratford-upon-Avon in 1595 – the appearance of the decorative and explicitly labeled commode coincided with the emergence of “French taste” around the middle of the 18th century. The best known examples are provided by Thomas Chippendale in his *Gentleman and Cabinet-Maker’s Director*, the third edition of which (1762) illustrated two “French commodes,” four “French commode tables,” five “commode tables,” and a comparable “buroe dressing table.” All had a decidedly Rococo appearance, although their fronts were more serpentine than parabolic, and their sides generally straight. Commodes remained in fashion throughout the Late Georgian period, the dominant form being that of the demi-lune (half-round). Most provided some storage with narrow drawers set into the apron or with shelves hidden by concave doors; others were purely decorative, such as the elaborately veneered unit attributed to John Linnell executed for Osterley Park. The vogue ebbed toward the end of the century. George Hepplewhite, in the *Cabinet-maker and Upholsterer’s Guide* (3rd edition, 1794), showed one “commode” and one “commode dressing table,” both part of the “dressing apparatus.” Sheraton included a “commode” and a “dressing commode” in *The Cabinet-Maker and Upholsterer’s Drawing Book* (3rd edition, 1802); defined it in the *Cabinet Dictionary*, as we have seen, offering two examples; and omitted it from the incomplete *Cabinet Encyclopedia* (1804).

The term commode was not applied to furniture in America, but it can be related on both formal and functional levels to the lowboy. Highly decorated examples from Philadelphia workshops resemble commodes produced by craftsmen in the Dauphiné and other French provinces.

Conran, Terence 1931–

British entrepreneur and interior designer

Terence Conran has made his passions into his life’s work. And in the spheres of design, food and retailing he has been without doubt one of the most influential figures of his age. Indeed, when many of the cultural movements of the last decades are examined there is often a thread that leads back to Conran. His inspirations have included the Bauhaus, English Arts and Crafts, Danish Modernism, Mediterranean exuberance, ethnic styles, peasant simplicity, and truth to materials. He has applied these enthusiasms exhaustively in all his businesses and, in so doing, he has transformed the way millions of people live.

Born into a middle-class family, he was brought up in Esher, Surrey, and was educated at Highfield and Bryanston public school. He went on to study textile design at London’s Central School of Art in 1949 and 1950, where he was influenced by Eduardo Paolozzi, with whom he shared a fascination for popular culture. Showing an early preference for the world of commerce over academia, he was tempted away from the Central School before graduating by a job offer from the architect and designer Dennis Lennon. Between 1950 and 1952 he produced textiles designs, the magazine *Rayon and Design*, furniture for the Ridgeway Hotel, Lusaka, and murals for the Festival of Britain. Following an exhibition in Simpson’s *Ideas and Objects for the Home*, he founded Conran and Company, manufacturing furniture and accessories.

A first visit to France in 1953 was to prove extremely influential, laying the foundations for the Francophilism that has remained with him ever since. In November 1953 he was part of a joint venture in a cafe called The Soup Kitchen which marked his debut in the catering industry; a year later he went solo when he designed and opened The Orrery restaurant in 1954.

1956 saw the founding of The Conran Design Group working in graphics, exhibitions, furniture and interiors including the shop Bazaar, for Mary Quant. Other ventures of that year were the establishment of Conran Contracts and Conran Fabrics, and the production of Conran’s first book, *Printed Textile Design*. He has since gone on to publish numerous books on furnishings and interiors and *The House Book* of 1974 became a best-selling guide to home design.

Increasingly frustrated with the resistance that his work encountered among retail buyers, Conran and his third wife Caroline decided to open their own shop and on 11 May 1964, Habitat opened its doors at 77 Fulham Road, South Kensington. Habitat’s aim was to provide low-priced furnishings in a simple Modern style. It was an immediate success, striking exactly the right note with a younger generation anxious to distance themselves from post-war austerity and eager for a new kind of lifestyle. After two years of good trading, Conran opened a second branch in Tottenham Court Road, which was followed by a rapid expansion across the country.

In 1968, the Conran businesses merged with Ryman, the stationery and office equipment group. Habitat mail order was launched in 1969. But by 1970 deep fissures had opened up in the newly joined company causing Conran to buy back

Habitat from Ryman although he had to leave behind Conran Contracts, Fabrics, Design, and the Thetford factory. He founded the design practice, Conran Associates, and the Neal Street Restaurant in 1971. By 1972, the Habitat chain was 12 strong and in the following November, The Conran Shop was born on the site of the original Habitat showrooms. Conran took Habitat to Paris in 1973, and then on to New York in 1977 where it traded as Conran's. The turn of the decade saw Habitat with 47 stores and in 1981 it was floated on the London stock exchange to become a Public Company. A further spurt of growth was achieved through a merger with the retail giants, Mothercare.

During 1983, Habitat-Mothercare acquired Heal's, and Conran Octopus was formed as a joint publishing venture with Paul Hamlyn. The ill-fated Butler's Wharf property development was initiated at the same time and the Conran Roche architectural practice was formed with Fred Roche. Terence Conran was knighted in the New Year's Honours list.

With none of his energy or enthusiasm for new projects dimmed, Conran bought Michelin House with Paul Hamlyn in 1985, and in 1986 Habitat Mothercare merged with British Home Stores to form Storehouse which also included NOW, and Richard Shops, and which had a combined turnover in excess of £1 billion. The Conran Shop expanded into Michelin House in 1987 but elsewhere the company's financial problems were mounting. Storehouse's profits had dropped by 29 per cent by 1988 and there were several attempted takeovers. After a two-year period of wrangling and in-fighting, and many failed attempts to reverse the group's dwindling performance, Conran stood down as Chairman of Storehouse in 1990 and bought The Conran Shop out of the group.

At an age when he might not unreasonably have been expected to retire from business, Conran decided to begin again. And with the singular determination that he had always shown he started to build up a restaurant business which went on to include Bibendum, The Oyster Bar, the Blueprint Cafe, Le Pont de la Tour, La Cantina, The Chop House, Quaglino's, and the enormous Mezzo. At the same time he expanded The Conran Shop group, established a Contracts division, started an architectural and design consultancy, CDP, and remained involved with the Design Museum and a variety of publishing projects. When Habitat celebrated its 30th birthday in May 1994, Conran was accorded the tribute of guest of honour and was welcomed back by the assembled throng as a returning hero.

The apparent contradictions in his nature are intelligible only when it is remembered that Conran is in every sense a Modernist. This term has become somewhat debased, but when it is understood in its original, early 20th century sense, it begins to explain how Conran can be on the one hand sybaritic and indulgent, and on the other a puritanical wielder of Occam's Razor. Modernism is also at the heart of his tenacious determination to improve the quality of people's lives through their environment in an essentially democratic manner. He has always understood just how much "Design" his public could tolerate but has never been cynical or contemptuous towards his customers. Nevertheless his involvement with first the Boilerhouse Project, and later the Design Museum, shows him to have been deeply concerned with issues relating to the education and improvement of public taste and

to the promotion of high standards within design. The Boilerhouse project, funded by the Conran Foundation between 1982 and 1986, consisted of a series of changing exhibitions, temporarily housed in the Victoria and Albert Museum, that explored some of the most celebrated icons – be they designers or artefacts – of the 20th century. They provoked enormous interest and excitement among the public and professional critics and designers alike and their success led to establishment of the Design Museum, that has been housed in its own building on Shad Thames since 1989.

On a personal level, Conran can be wily and sharp-witted but he has a scrupulous honesty which derives from a totally secular moral code. He can enforce a stringency that comes close to meanness but in the next instance can be generous and thoughtful. Considering his great wealth he lives well within his means. Money has only ever been his tool, the fuel necessary to make his projects run. His twin passions are his businesses and his life, and because he has never made any clear separation between work and leisure, he can appear indefatigable. Restless when not at his desk or immersed in one of his many businesses he drives ever onward.

Despite the fact that he describes himself primarily as a designer, Conran's real skill is as an editor, having always gathered around him a team of talented devotees who share his beliefs and codes. In this sense he is a true charismatic, able to inspire loyalty and optimism in his employees, many of whom have gone on to achieve considerable success in their own right. Conran is also one of the great retail innovators of our time and many of the aspects of shopping that we now take for granted started in Habitat or one of the other businesses that he either designed or advised. The Conran Shop in London is often praised as one of the most inspiring and beautiful home furnishing shops in the world. It is also one of the principal outlets for international Modern design promoting goods that range from design classics by giants such as Le Corbusier, Marcel Breuer and Mies van der Rohe to new work by contemporary designers like Matthew Hilton, Pascal Mourgue and Philippe Starck. The success of the Fulham Road shop has spawned offshoots in Paris and Tokyo and further branches are planned in north London, Glasgow, Hamburg and other European cities.

Conran has been receptive to many diverse influences but he has nevertheless always retained a peculiarly English point of view, save in his tireless fight against what he has perceived as the impoverishment of the English visual tradition. It is all the more remarkable that a man who has no formal design qualifications and severely impaired sight in his left eye should have so shaken the taste of nations. The perceptions and practices of the British design establishment and many sections of the British public have been so fundamentally changed as a result of Conran's influence that one is reminded of the old adage that "in the valley of the blind, the one-eyed man is king".

Biography

Terence Orby Conran. Born in London, 4 October 1931. Educated at Bryanston School, Dorset, 1944–49; studied textile design at the Central School of Arts and Crafts, London, 1949–50. Married:

1) Brenda Davison, 1952 (divorced); 2) Shirley Ida Pearce, 1955 (divorced, 1962): two sons, furniture designer, Sebastian and clothes designer, Jasper; 3) Caroline Herbert, 1963 (separated): two sons, Tom and Edmund, and one daughter, Sophie. Textile designer for the Rayon Centre, London, 1950–51; interior designer, Dennis Lennon studio, London, 1951–52; established freelance furniture design practice, Conran and Company, and worked for many firms including John Lewis Partnership, Edinburgh Weavers, and Simpsons of Piccadilly, 1952–56; founder-proprietor (with Ian Storey) of Soup Kitchen Restaurants (London), 1953–56; founder-director (with John Stephenson), Conran Design Group, London, 1956–71; Chair of Conran Design Group from 1971; founder-director from 1964, and Chair from 1971 of Habitat furnishing stores; Joint-Chair, Ryman Conran Ltd., 1968–71; Chair, Conran Stores, Inc., since 1977; Chair, Jasper Conran fashion company, London, from 1977; Director from 1979, and Chair, 1981–83, J. Hepworth and Son, London; Chair, Habitat Mothercare Ltd., London, from 1982; Director, Conran-Roche architectural and city planning firm, London, from 1982; Chair, Conran Octopus publishing company, London, from 1983; Chair, Butlers Wharf Development, London, from 1984; Director of Michelin House Development, London from 1985, and Chairman, Bibendum Restaurant, from 1986; Director of British Home Stores plc, and Savacentre Ltd., London, from 1986. Numerous restaurants from 1986, including Quaglino's and Mezzo (1995). Founder-trustee, Conran Foundation for design and industry, from 1982, and the Design Museum, London, from 1989. Member, Royal Commission on Environmental Pollution, 1973–75; Council Member, Royal College of Art, London, 1978–81, and since 1986; Advisory Council Member, 1979–81, and Trustee since 1984, Victoria and Albert Museum, London. Awarded Presidential Medal, 1968, 1975, and Bicentenary Medal, 1983, Royal Society of Arts, London; Society of Industrial Artists and Designers Medal, London, 1980; *Daily Telegraph* / Association for Business Sponsorship award, London, 1982. Received a Knighthood, 1983; made Honorary Fellow, Royal Institute of British Architects, 1984.

Conservatories

The modern-day conservatory which serves as an additional sitting room built onto the garden side of the house has its roots in the orangeries and glasshouses, constructed for the cultivation of exotic or out-of-season plants and fruits, that first appeared in the 17th century. These buildings used a variety of means, including warmed air flues, peat or charcoal fires and coverings of rush or woven matting, to cosset the delicate plants and were often rectangular in form with large windows to admit sunlight. John Evelyn is often cited as the first person to use the term "conservatory", which he did in 1664 when it was still fully interchangeable with orangery and greenhouse. His travels in France and Italy also revealed how the cultivation of tender plants was deeply entrenched in the social fabric of aristocratic life. Leiden Botanical Garden (1599) and the palace at Heidelberg (built by Salomon de Caus in 1619) represent early designs for winter shelters where walks could be taken accompanied by the fragrance of orange blossom and fruits. And a substantial orangery built at the Villa Aldobrandini, Frascati (before 1646), with tall shuttered windows below an upper smaller tier fitted in between the ceiling vaults, is a large and handsome structure which would have impressed itself on the procession of eminent travellers who continued to visit the villa in the late 17th and early 18th centuries.

French taste, inspired by Italian gardens, developed at Vaux-le-Vicomte and Versailles towards a unified house and garden conception to which André le Nôtre, gardener to Louis XIV, contributed so importantly. Orange trees still held pride of place in English formal gardens with continuing French influence through André Mollet at Queen Henrietta Maria's Wimbledon Manor House where a large garden house was "... fitted for the keeping of Oringe Trees". Another enthusiast, Philip Stanhope, 2nd Earl of Chesterfield, housed orange and lemon trees and winter greens in a handsome pedimented summerhouse at Bretby, Derbyshire, which was admired by Celia Fiennes on her travels in 1698. Wollaton (1696) and Chatsworth (1697) were two of many examples that must have been affected by King William's heavy tax on glass, a miscalculation that was fortunately short-lived and repealed within three years.

Several royal orangeries or glasshouses from this period are still in existence. The glasshouse at Hampton Court is in the form of a long brick and tiled-roof structure, and was designed in simple and unadorned style by Sir Christopher Wren to look southwards over the new Dutch garden laid out in William and Mary's reign. Queen Anne's orangery at Kensington Palace (1704) is a detached building and has been attributed variously to both Wren and Vanbrugh but its balanced elegance with two

Conservatory at Dudley House, Park Lane, London, 1890

circular end rooms and a linking central space leaves no reason to dispute its claim to be one of the finest buildings of its type to survive. Unlike most other orangeries of this date whose interiors were generally plain, the interior at Kensington Palace was enhanced by semi-circular columns interspersed with niches for statuary and it was regularly used by the Queen for winter promenades and supper parties.

The 18th century has been described as the golden age of the greenhouse when horticulture and botanical gardens flourished in Sweden, Germany, Holland, England, France and Italy. The influence of Picturesque theories which revolutionised British garden design in the last part of the century also helped to encourage the building of conservatories. Humphry Repton, a leading figure in the Picturesque movement, developed many ideas for classical and "Gothic" style conservatories in his *Observations on the Theory and Practice of Landscape Gardening* (1803), and an increasing fascination with nature – both wild and cultivated – encouraged an interest in breaking down the rigid distinctions between the house and its interiors and the garden outside. Many fanciful structures date from this period among the most striking being the Indian or Moghul style greenhouse and pavilion built at Sezincote, Gloucestershire (c.1805) by Samuel Pepys Cockerell which made extensive use of new techniques such as cast iron and bronze and large sheets of glass.

The manufacture of cast iron and sheet glass transformed glasshouse design by permitting improved lighting and windows and structures of much greater size. But given that glass was once again subject to heavy duties, costs were high and conservatories remained the prerogative of the very rich until the tax was repealed in 1845. Shortly before this, Joseph Paxton, then head gardener at Chatsworth House, had designed the Great Conservatory in collaboration with Decimus Burton to house the 6th Duke of Devonshire's tropical plant collection. He introduced a "ridge and furrow" glazed construction which enabled him to produce the largest glass building in existence, measuring 277 feet long, 123 feet wide and 67 feet high. Ten years later, Paxton's miraculous Crystal Palace was erected in 22 weeks using the same system and housed the 1851 Great Exhibition in Hyde Park. In this building Paxton increased the overall dimensions to 1,848 feet by 408 feet, a work of genius that made him a popular hero. Applied interior decoration was devised to a simple formula by the colour theorist and architect Owen Jones, who used three primary colours of red for the underside of the girders, yellow for the columns and blue to emphasise the recessed areas in concave surfaces.

Paxton's Crystal Palace may have been inspired by Decimus Burton's Palm House at Kew (1848) which was another vast free-standing glasshouse, and there was clearly considerable cross-fertilisation of ideas between the two men. More traditional examples of country house conservatories were built in England by members of the Wyatt architectural family, including the greenhouse at Doddington Park, Gloucestershire (1797–1817), and Wollaton Hall, Nottinghamshire (c.1804), but the Scottish Kibble Palace, designed by Boucher and Cousland in 1865 and now erected in Glasgow Botanic Garden, followed the innovative materials and style used by Burton and Paxton. The Royal Palace at Laeken, Belgium had

a similarly spectacular curvilinear winter garden designed by Alphonse Balat in 1876.

The emphasis in America was on public parks and gardens, and Boston's Public Gardens contained two successive camellia houses before 1850 – a much earlier date than the conservatory in Central Park, New York of 1899. Philadelphia and Pittsburgh were among many cities to create similar "leisure centres" during the mid and late 19th century, while private owners, whose enthusiasm for horticulture was spurred on by a treatise written by A.J. Downing in 1844, added their own conservatories to the mansions along the Hudson River and elsewhere.

While many of the conservatories built in the grounds of larger country homes were still primarily intended for promenading and nurturing exotic plants, the mid and later Victorian period also saw a shift away from the "gardener's conservatory" to the "architect's conservatory" which gave priority to the social uses of the room. These rooms generally led off one of the back reception rooms and were used as places for informal entertaining, smoking or as a quiet retreat. They were comfortably furnished with lightweight rattan or wicker tables and chairs, and might have parquet or tiled floors covered with Turkey carpets or rugs. And as the actual business of planting was increasingly relegated to a separate greenhouse, the greenery was confined to arrangements of potted plants. Grander versions of these domestic conservatory-living rooms could be found in the large winter gardens that were so characteristic a feature of late 19th century fashionable resorts and hotels, where afternoon tea and refreshments were served.

Arts and Crafts and Cottage Style architects of the early 20th century on the whole neglected conservatories in favour of open loggias or verandas, furnished with rustic pieces such as a dresser, settle and simple rush-seated chairs. Such spaces could be used in summer for eating or even sleeping and were ubiquitous in brick-built, vernacular-style country homes.

The current revival of the conservatory is a comparatively recent trend and dates back only to the last twenty years. It has been motivated principally by the desire to provide additional living space and once again the conservation of plants takes second place to the provision of a garden or sitting room. Separate greenhouses may provide the amateur or professional gardener with their home-grown exotic species, but garden centre pot-grown plants offer an alternative solution for immediate decorative effects. Garden room furnishings are usually light and portable with loose cushions for sofas and chairs and windows fitted with roller or Venetian blinds. But when conservatories are used as a family sitting or eating room (a situation made possible by the provision of all-year-round central heating), their furnishings may not differ greatly from those in other areas of the house.

Standard ranges of conservatories have been manufactured since the late 19th century but the number of firms involved in this trade has expanded greatly since the 1970s. Most companies produce items that can be adapted to different sites, but better results can generally be achieved by using firms that offer design by architects or other trained designers who can apply principles of proportion, unity, detail and scale in relation to the main building.

Further Reading

A general history of the development and uses of conservatories and greenhouses in Europe and America appears in Woods and Warren 1988 which also includes a detailed bibliography. Boniface 1982 includes numerous contemporary photographs from the late 19th century onwards as well as a concise but informative survey of the subject. For a more detailed study see Kohlmaier and von Sartory 1986 which features an illustrated catalogue raisonné of more than a hundred historic conservatories, and Marrey and Monnet 1986 which provides an excellent social history of the subject.

Constructivism

Russian Constructivism first emerged at the beginning of the 1920s. Over the following decade it developed into a broad and influential movement covering architecture, industrial and exhibition design, typography, theatre and cinema design, and the applied arts. The new movement actively drew artists from different disciplines who were united by a search for aesthetic ideals and artistic forms to express the social progress that was taking place in Russia after the revolution. They saw their task as the creation of a spatial environment which would organise the new way of life. The design of interiors, furniture and everyday items became essential to the creative practice of Constructivism and to the realization of an idea which saw art

as a constructor of life, showing the way forward for architecture and real practical work in industry.

Vladimir Tatlin (1885–1953) occupied a central position in the development of Constructivism and he was the first to give expression to the new interior in his experimental project for the monument to the Third International (1919). Tatlin's structure symbolized a rejection of decorative form in favour of ascetic expediency and the role of engineering, technical forms and new materials in formulating the new style. The spiralling framework of the construction supported three rooms placed on top of each other – a conference hall and two centres for administration and information respectively. In his own description of these interiors, Tatlin spoke of a space that could transform itself dynamically and of multi-functional equipment. It was an idea subsequently much used by other architects.

The Working Group of Constructivists which was formed in 1921 in the Moscow Institute of Artistic Culture by A. Rodchenko, V. Stepanova, A. Gan, the brothers V. and G. Stenberg, K. Medunetsky, and K. Ioganson played a crucial role in establishing the movement. The group's theoretical treatise was written by Alexei Gan and later developed in greater detail in his book *Constructivism* (1922). The group's initial creative aspirations, which had started out as abstract aesthetic experiments with form, centred on functional design for living leading to the creation of objects for everyday use. The practice spread widely within the Higher Artistic and Technical Workshops (later Institute), an educational institution where the faculties of art, architecture and industry all came together to make experimental models of standard furniture for private houses and public buildings. Particular attention was paid to the artistic problem of form, which was considered in close connection with the social and ethical role that the object was to play in the new society.

The work of Alexander Rodchenko (1891–1956), El Lissitzky (1890–1941), Tatlin and other professors, and of their students in the Workshops, in designing furniture and other domestic objects played an important role in establishing a new type of art – that of industrial design. Their first designs were shown at the annual exhibition of 1923, and included three categories of objects: those that could be folded (a folding bed), items that performed several functions (a bed which also served as an armchair) and objects that involved movement (a moveable display window on an "endless" track). Once they had mastered the creation of new types of furniture, the Constructivists moved on to more complicated projects concerning the internal environment.

The discipline of multi-functional furniture and equipment design was taught by Lissitzky, who first introduced Europe to the term Constructivism in 1922. However, the most significant achievements in this field are linked with the work of Rodchenko in the Metalwork faculty. Furnishings for a Workers' Club, based on the use of multi-functional constructions and including standard furniture types, different sorts of moveable boards and screens for displaying posters, slogans, photographs and slides, and lamps to direct light where it was most needed, were made for the Paris Exposition Internationale des Arts Décoratifs et Industriels Modernes (1925) from drawings by Rodchenko. The fact that the furniture was painted white, black, grey and red reinforced the

simplicity of the forms and the asceticism of the club's artistic interior, thereby expressing the aesthetic ideal of Constructivism.

Rodchenko actively developed the new methods for the organisation of objects in the environment in the second half of the 1920s, when he was in charge of producing different furniture designs for the many workers' clubs that were being built at the time. To popularize his ideas, Rodchenko published his designs for models and became involved in designing sets for the theatre and cinema, including *The Journalist* (1924), *The Doll with Millions* (1927), *Albidum* (1928) and the play *Inga* (1929), which showed contemporary office and living interiors. All his sets had rational furniture where every component was a carefully reworked and experimental model of the new furniture that could be folded away and used for several purposes.

Tatlin had a different approach to furniture design. In 1927 a soft bentwood chair was made under his direction. Unlike his contemporaries, who relied on industrial technology and the use of tubular steel in furniture construction, Tatlin chose to work with organic materials. The slightly elastic chair was constructed from curved switches of wood which bent to create a spring and form a chair that could support the whole body from legs to elbow and back rest. In comparison to the chairs designed by Mart Stam (1926) and Mies van der Rohe (1927), Tatlin's chair is less technological – it is assembled entirely by hand. The antifunctionalism, sculptural nature and anthropomorphism of Tatlin's forms make his relationship to material and furniture design similar to the approach adopted by Alvar Aalto.

In the early stages of the development of Constructivism, the renewal of principles of interior design was mainly linked to experimental projects and exhibition models. It was only in the mid-1920s, when real construction was resumed in Russia, that the conditions were created for the artist-Constructivists, who had worked in the field of industrial design, to join forces with the architect-innovators. Their collaboration was officially sealed in 1925, with the formation of the Society of Contemporary Architects (OSA.), which included among its members Alexander (1883–1959), Leonid (1880–1933) and Viktor Vesnin (1882–1950), Moisei Ginzburg (1892–1946), A. Nikolsky (1883–1953) and their followers, as well as a group of designers.

The “functional method” (A. Vesnin, Ginzburg) lay at the basis of Constructivism in architecture. It was an extensive programme which sought to make a building as functional and practical as possible. Having linked their art to the task of organising the necessary processes for living, the architects worked on designing houses and public buildings which would demonstrate the new social relationship and emphasise the new attitudes to life, work and leisure.

First and foremost, Constructivist architects sought to create a rational and comfortable internal environment, which would unite all the rooms with their different purposes into one single organism that was itself determined by its function. Design followed the principle of revealing the “inside on the outside”: from working out a free and often asymmetrical plan of a building, its constructive basis and interior, to the exposure of its volume. In its best examples, Constructivism was able to solve architectural problems by revealing the internal

structure of a building on the outside and by giving the internal space a practical and artistic interpretation.

Constructivism reached its fullest aesthetic potential, and its most interesting functional and technical solutions, in public buildings. The new social task meant that the architect had to design buildings that could hold mass activities, meetings and performances. In order to meet these demands, huge rooms were designed where the internal space could be altered and where the ceilings were not dependent on the support of pillars.

Architectural Constructivism announced itself in the competition designs for the Palace of Labour project (1923, Vesnin brothers), where the aims of the new method were successfully realized for the first time. The building, which comprised two volumes – a cylinder and a tower – was conceived inside as a system of halls and auditoria which could be adjusted to form one colossal room by using wrought-iron screens. Thus the internal space acquired at one and the same time a sense of unity and differentiation according to function.

In designing the main, oval hall, the Vesnins turned to the form of the amphitheatre which they saw as a democratic alternative to the traditional tiered design. The first actual example of this idea was the auditorium in the Palace of Culture in the Moscow-Narvsky region of Leningrad (1924–27, A. Gegello, D. Krichevsky). The subsequent use of the amphitheatre design in public buildings and places of entertainment, where the foyer and lobbies also fed into the main auditorium, led to a number of interesting solutions (Government Building in Alma-Ata, Kazakhstan, 1928–1930, M. Ginzburg, I. Milinis; Palace of Culture at the Likhachev Factory in Moscow, 1932–37, Vesnin brothers). Within the theatre, the emphasis was more on a circular auditorium which joined onto the stage. Out of necessity part of the stage became an extension of the amphitheatre (competition designs for the theatre in Kharkov, 1931, Vesnin brothers).

In Constructivist architecture, a building's interior was determined by simple undemonstrative forms which expressed the aesthetic ideal of Constructivism and which, in turn, dictated the strict choice of method. The introduction of new technical solutions and the extensive use of reinforced concrete, steel and glass enabled the Constructivist architects to experiment widely in the organisation of the internal environment. Interiors were constructed according to the principle of interpenetrating spaces “flowing into one another” and this led to the illusion of a compositional play within the building. On moving through the building, the interaction of the various elements, which all served different purposes, created calculated effects from perspectives that were constantly changing. In their designs for the Kharkov theatre, the Vesnins put the lobby, foyer and the auditorium all on one axis, treating them as a complete unit without partitions which would have isolated them. As a result, the entrance and the stage appeared to be visibly linked. The idea of an internal space which remains complete and is not broken up was effectively realized in the work of Ivan Leonidov (1902–59). In his project for the House of Industry in Moscow (1929–1930), he drew up a plan of a typical floor in an office building where the walls were replaced by plants which delineated the areas for work, rest and sport. Leonidov was responsible for introducing the popular practice of covering walls with large windows. This

was intended to create a sensation of unity between the internal and external environments, and of the abundance of light and air. Similar methods were also developed by Ginzburg and the Vesnin brothers.

Artists' experiments with form at the beginning of the 1920s exerted a considerable influence on the architectural practice of the Constructivists. The interiors designed by the Vesnin brothers and I. Golosov (1883–1945) for the Zueva Club in Moscow (1927–28) were greatly enhanced by the introduction of methods taken from painting – by the contrasts of simple geometric volumes and curvilinear forms – and by features such as round columns, stairs, galleries and rib vaulting. Emphasis was consciously placed on the architectonics of space by exploiting the potential of the materials themselves in terms of colour and *faktura* (texture).

Colour was exploited by the Constructivists as one means to organise space and increase its expressive qualities. As early as 1923–25 Tatlin conducted the first experiments along these lines, trying out new colours and their combinations. On the basis of these experiments, Tatlin devised standard interiors for apartments. The aesthetic, emotional and psycho-physical effects of a building's interior design were used extensively for the first time by Ginzburg in the Government Building in Alma-Ata). The artist Sheper was invited from the Bauhaus to help work out colour solutions for the interiors of the living quarters of the employees of the Commissariat of Finance (Narkomfin, 1928–30, Ginzburg, and Milinis). The artists P. Likin, A. Kolodin and V. and G. Stenberg were also actively involved in the interior design of the Likhachev factory's Palace of Culture.

Attracted by the prospect of creating new types of buildings, the Constructivists devoted much of their time to the problem of housing, including planning communal housing blocks. The popularity of the idea of the full socialization of the home environment led to a number of competitions and construction projects where kitchens and subsidiary rooms were removed from flats; the living quarters, which were reduced to a minimum, were then linked to the main complex of social amenities by covered walkways. Within the students' communal block in Moscow (I. Nikolaev, 1929–30), the functions of the eight-storey sleeping quarters, housing a thousand sleeping compartments / rooms, and of the public block, were strictly delineated. The interiors of the latter (the lobby, reading room and sports complex) had their own expressive features.

The idea of "typification" or standardisation emerged in the mid-1920s. This led to intensive work on developing standard living units and to an increase in sectional planning. In 1927 a competition launched by OSA to design the new communal dwelling revealed a tendency to rethink the entire structure of a building. The most successful entry was a project by Ginzburg; this proposed a new type of flat – a spatial unit that was divided into rooms on two levels, each with different functions. The split level meant that the living quarters had ample space and that the internal central corridors could cut through the storey, so making for economical use of the building's volume.

Towards the end of the 1920s, a number of different government planning organisations began to research the standardization of housing for workers based on rational designs, under the direction of Ginzburg. Small flats were to be

equipped with standard furniture, including multi-functional items and purpose-built equipment. The internal space in some of the units was to be divided by using folding metal screens. These were tried out in the "transitional" house types which had a block with six different versions of living units and a communal block with kitchens and a kindergarten. Five such communal houses were built in Moscow, Saratov and Sverdlovsk. Among these was the house built for the Narkomfin employees. The main living quarters had several flat modules to suit different families. Units comprising a tall common room (5 metres) and a bedroom (2–3 metres), were the most consistent and effective realization of the principle of interpenetrating spaces. The two-storey structure meant that the building only needed two internal corridors. Differences in the height and size of the rooms were matched by a rational use of windows – narrow ribbon windows in the bedrooms and tall glass screens in the common rooms. Le Corbusier in 1925 was the first to suggest the idea of a contemporary small flat with problems of space solved by having two storeys, but the idea was realized in the Narkomfin building, where the problem of the internal environment was seen as a complex task involving the exploitation of all the possibilities of colour and the new rationalist furniture.

The work of the Constructivists in designing space-saving living units was an important stage in the standardization of flats which was subsequently continued by other architects elsewhere. Unfortunately, the opportunity did not exist in Russia for many interesting experiments to be fully realized. In the mid-1930s Soviet architecture took an abrupt about turn towards traditionalism. The period of experimentation had come to an end.

Consumerism

Before the 19th century interiors were decorated by craftsmen who provided materials on a bespoke basis for the wealthy. With the rise of the bourgeoisie and the impact of mass production in the second half of the 19th century, items to decorate the interior became available through shops, most notably the department store. Department stores were gigantic buildings which housed a vast array of consumer goods in various sections or departments. In terms of interior design they were important not only for the supply of furniture and furnishings, but also in the creation of taste and fashion from the 1880s onwards through the use of the lavish displays of room settings and the design of the shop interiors themselves.

The first purpose-built department store in London was Selfridge's, built by Gordon Selfridge using his knowledge of American stores in 1909. This Empire Revival style building reflected the American fascination with the French Beaux Arts. The building was entirely open-plan as it was constructed using a steel frame. This enabled the consumer to browse, to roam around the shop experiencing the luxury on offer without feeling the necessity to buy. This differentiates the department store from the bespoke craftsman's premises where fixed prices would not be on display. Selfridge's great rival, Harrod's, was founded in 1849 on Brompton Road, Knightsbridge, expanding rapidly throughout the late 19th century to its current size on a 4.5 acre site providing 14 acres of selling space on five floors. In common with most department stores, a massive range of goods were on sale from luggage to food to perfumes. In 1883 there was a fire and Harrod's was rebuilt. An article in the *Chelsea Herald* described the household furnishings area, and in particular the range of lighting: "But this is not all that is to be found here, for there is a big show of lamps, from those burning benzoline and costing a few pence, to the delicately painted china varieties, for the drawing room or boudoir, and as a direct contrast there are lanterns for stable use and the burglar's bull's-eye". Harrod's exported its goods worldwide using the mail-order catalogue to aid choice.

Paris also witnessed a boom in the opening of department stores with Au Bon Marché in 1872, Les Grands Magasins du Louvre in 1877, Au Printemps in 1881 and La Samaritaine in 1903. At Les Grands Magasins customers could buy exotic, decorative objects, textiles and carpets imported from Albania, Syria, Mauritius and Martinique. At Au Bon Marche antique furniture could be bought, plus a wide range of reproduction

pieces. The Parisian department stores were also important in the promotion of Art Deco during the 1920s. Les Galeries Lafayette opened its *atelier d'art moderne* in 1921, directed by leading decorator Maurice Dufrène and christened La Maitrise. The atelier manufactured furnishings, fabrics, carpets and accessories designed by Dufrène and his team which were displayed in the windows of the department stores, in sumptuous room settings and illustrated on the pages of catalogues.

By the 1930s the heyday of the department store was over, as smaller, more specialised shops began to compete and the economic depression curtailed consumer spending. During this period the consumer began to be taken more seriously with the foundation of the American Consumers' Association, financed by members' subscriptions, which gave advice about consumer goods to potential buyers. A similar organisation was founded in Britain in 1957: the Consumers' Association publishes *Which?* and *Shopper's Guide* to arm consumers with useful advice.

During World War II choice in terms of furnishing the home was limited for the consumer with the introduction of rationing and official good taste. It was not until the 1950s that a consumer boom developed in America followed by Western Europe. The Contemporary Style and a popular Modernism, inspired by Scandinavia and the Cranbrook Academy, hit the shops. In terms of consumerism, the new trend for Do-It-Yourself (DIY) made a huge impact. Before the 1950s there had been a tradition of home carpentry, whereby the male of the household would build modestly sized furniture or erect shelves. During the 1950s this type of activity became more commercialised with more decorating materials and goods on offer and more leisure time to indulge in creating a stylish home. By the end of the 1950s sales of DIY tools and accessories in America had an annual turnover of \$12 billion.

In Britain new magazines were launched to advise the DIY enthusiast and advertise the new range of products. This included *Do It Yourself*, launched in Britain in March 1957, which included plans and instructions for ambitious building projects including beach chalets and three-piece suites. The materials for creating your own dream home were sold through a new type of shop. Previously sold by the hardware store, the goods now became available from shops such as the Texas chain, established during the 1950s. Texas Homecare began as a family business in 1911, manufacturing wooden fireplaces. In 1954 the company opened several shops selling wallpapers and paint. In 1972 Texas opened its first warehouse for the large-scale provision of materials for home improvements, and by the late 1980s there were almost two hundred such outlets. The market for such goods for the amateur decorator has partly been stimulated by simple-to-use emulsion paints and readily available wallpapers. For example, in 1948 sales of wallpapers in Britain totalled only 43.9 million rolls; by 1958 the volume was 115.4 million rolls. The mass availability and convenience of such decorating materials has been complemented by a growth in popular literature on the subject. For example, the Home News editor of the *New York Times*, Betty Pepis, published *How to Be Your Own Decorator* in 1962 and journalists Mary Derieux and Isabelle Stevenson advised in *The Complete Book of Home Decorating* in 1956: "Start an indexed scrapbook in which you can collect magazine articles, advertisements of new types of equipment and

furnishings, room pictures and color schemes which appeal to you. Don't be afraid to give expression to your own taste in making your selections. It is *your* home." The idea that the interior decoration of a house was symbolic of individual taste and an empty canvas for amateur design is peculiar to the post-war era and stems from the burgeoning commercialisation of DIY. This emphasis on the consumer and individual taste also contributed to the demise of Modernism in interior design and the adoption of a more pluralistic approach.

"Contemporary" Style

"Contemporary" was the adjective used in Britain during the 1950s to describe the new self-consciously modern style of interior design which achieved widespread popularity shortly after World War II. The emergence of the "Contemporary" style during the early post-war years was very much an international trend, however, and in many respects Britain was rather slow off the mark in adopting the new aesthetic compared to other countries such as Denmark, Sweden, Finland, Italy and the US, who rapidly emerged during the late 1940s as the new design superpowers of the post-war era. The British public did not really begin to embrace "Contemporary" design actively until the Festival of Britain in 1951, and for this reason, because "Contemporary" design in the UK is so closely associated with the Festival of Britain, it has also been dubbed the Festival style.

Another evocative phrase coined at the time was "The New Look". This phrase, which crops up repeatedly in product advertisements from this date, was co-opted from the world of haute couture following the launch of Christian Dior's revolu-

tionary new collection of spring 1947. By the mid 1950s the use of the phrase "The New Look" had declined, however, as it became less appropriate to keep referring to what was now a well established style as "New". Other terms which were used contemporaneously, or which have been adopted retrospectively to describe the "Contemporary" style have usually been specific to certain countries or regions or to limited aspects of the style. These include California Modern and Organic (both specific to the US), Scandinavian Modern (applied exclusively to the furniture and furnishings produced in Finland, Denmark, Sweden and Norway), and Neo-Liberty (a term used only in Italy, where parallels were drawn between "Contemporary" design and the revival of interest in Art Nouveau, which had been known in Italy as Stile Liberty because of its association with the London department store, Liberty's). Although no one single term was adopted internationally at the time to define the new style, the word "Contemporary" was frequently used in North America as well as in Britain and it is on the basis of this widespread contemporary usage that this adjective is now applied retrospectively to characterise international developments in design between 1945 and the early 1960s.

During the 1920s and 1930s the two prevailing styles of progressive interior design were the Modern and the Moderne, the latter being a blatantly decorative pastiche of the former. Whereas the Modern and the Moderne reflected two ideological extremes – "less is more" (in the words of Mies van der Rohe) versus "l'art décoratif" – the early post-war "Contemporary" style represented the successful fusion of the functional and the ornamental. "Contemporary" design was more accessible than early Modern Movement architecture, and it became popular because it struck a balance between the clinical and the expressive. During the late 1940s and early 1950s, for example, the houses of Richard Neutra, a key figure in the development of the California Modern style, and in the transition between first generation Modernism and second generation "Contemporary" design, were singled out in the media for their human qualities. In these dwellings the concept of the house as a machine for living in was reconciled with the impulse to create a building that could be enjoyed as a work of art. The crucial difference was that, while fulfilling the Modern Movement precepts of functionalism, simplicity and truth to materials, "Contemporary" design acknowledged the vital humanising role of visual stimulation and aesthetic variety within the interior. Combining clean lines and a sense of spaciousness with stimulating colourways and abstract patterns, "Contemporary" design was a relaxed and expressive style which established a middle ground between the austerity and high seriousness of Modernism and the playfulness and frivolity of Jazz Moderne.

"Contemporary" architecture and "Contemporary" furniture and furnishings developed hand in hand during the early post-war period, with the latter being produced as a direct response to the former. New buildings were noticeably lighter and airier than in the past, lighter both physically in terms of how they were constructed, and aesthetically in terms of the amount of natural light entering the interior. Furniture, too, became proportionately lighter as a result, the heavier structures of the inter-war years appearing out of place and unbalanced in these new surroundings. Even the tubular steel framed

"Contemporary" Style: interior from *Daily Mail Ideal Home Book*, 1956

furniture of Marcel Breuer and the bent laminated wood furniture of Alvar Aalto, revolutionary and fresh though they had seemed during the 1920s and 1930s, looked a trifle cumbersome in the "Contemporary" interior of the late 1940s. Not until a new range of lightweight, pared down and more skeletal designs had been developed and put into production after the war did furniture design catch up with, and successfully complement, the new style of interior architecture. This was why the spidery plywood and metal dining and lounge chairs of Charles Eames (the LCM and DCM ranges produced by Herman Miller from 1946) were so popular during the early years after the war.

A typical "Contemporary" building, such as the Case Study Houses sponsored by *Arts and Architecture* magazine in the Los Angeles area over a twenty-year period between the mid 1940s and the mid 1960s, was constructed using a post and beam framework made of steel bars, with thin cladding infill panels and large sheets of glass sheathing the exterior. In the proto high-tech Case Study Houses of Craig Ellwood and Pierre Koenig, the steel beams were left exposed on both the interior and the exterior, and formed an integral part of the overall aesthetic. This was truth to materials taken to an extreme. Sometimes, as in the Farnsworth House by Mies van der Rohe and Philip Johnson's Glass House, designed in 1946 and 1949 respectively, the cladding material was exclusively glass, and the "Contemporary" house was transformed into a transparent floating pavilion. Needless to say, the increased use of glass in post-war architecture had a dramatic impact on the

interior. It broke down the conventional barriers between the interior and the exterior of the house, and it brought the landscape inside the building so that it could be experienced with greater immediacy. In the early post-war houses of Richard Neutra, such as the Moore House in Ojai, California, 1952, the architect dispensed entirely with window frames in the corners of certain rooms. Instead they had invisible mitred glass butt joints which provided an uninterrupted view of the surrounding landscape.

Many of the same basic principles of design were applied to the construction of larger buildings such as apartment blocks, schools and offices, although here a reinforced concrete grid structure was usually adopted in the place of steel beams. Concrete, both poured and prefabricated, played an increasingly important role in post-war architecture. The 1950s also witnessed the birth of Brutalist architecture, but in terms of interior design it was rare to find exposed concrete, other than concrete insulation blocks, used as a surface finish on the interiors of buildings until the 1960s. The exceptions to this were the giant concrete shell structures created by architects such as Pier Luigi Nervi in Italy and Eero Saarinen in the US as sports arenas and transport terminals, where concrete was used as both a structural and a decorative, sculptural material.

In the best "Contemporary" houses there was usually a remarkable coherence between the design of the interior and the exterior of the building. This was partly due to the legacy of Frank Lloyd Wright who, although no longer a major player himself after the war (with the exception of his final masterpiece, the Guggenheim Museum in New York, completed posthumously in 1959) had an enduring influence on the younger generation of architects practising during the 1950s. Of particular significance were his ideas about organic design, and about the importance of treating the interior and exterior of the building as a unified whole. It was largely as a result of Wright's example that architects of the 1950s paid such close attention to the finishes and decoration applied to the interiors of their buildings. A typical Wrightian characteristic was to leave areas of exposed masonry on the interior in order to create coherence and continuity between the inside and the outside of the house. As well as concrete blocks, other forms of masonry used as cladding materials on "Contemporary" buildings included brick and stone. These were frequently left unadorned on both the interior and the exterior rather than being plastered, painted or rendered. Architects of the time were keen to explore the visual effects created by juxtaposing materials with contrasting surface textures, so areas of exposed masonry were often to be found in the same room as areas of smooth wood in the form of tongue and groove boards or veneered plywood panels.

The approach of the Danish architect Arne Jacobsen to the design of his buildings during the 1950s illustrates another way in which "Contemporary" architects were influenced by the total design ideas of Frank Lloyd Wright from earlier in the century. In a truly organic building, not only was minute attention paid to the interior layout and to surface finishes, but also to the design of all the furniture, fittings and accessories. In the case of Jacobsen's St Catherine's College in Oxford, completed in 1964, this attention to detail extended right through from the landscaping of the grounds, to the design of the special high-backed chairs at the high table in the dining room, to the

seating in the lecture theatre, to the light fittings in the study bedrooms. Jacobsen himself was personally responsible for virtually every detail of the scheme, and the all-embracing nature of his vision pervades the whole project. Although few other architects were quite so meticulous, this type of attention to detail, whether in the selection of existing products or the commissioning of new designs from others, was not at all uncommon during the 1950s and was a distinguishing feature of "Contemporary" design.

Because so much new housing and so many new schools and local amenities were needed in both Europe and America immediately after the war, buildings began to be designed on a modular basis so that they could be quickly constructed on-site using prefabricated components. This naturally affected their internal arrangement as well. The use of a reinforced concrete or steel bar structural framework in place of load-bearing walls also had a significant effect on interior design because it meant that there were fewer interior dividing walls. This led to a surge of interest in open-planning during the 1950s and 1960s, and to its widespread usage in both private dwellings and in public and commercial buildings. Neither open-planning nor curtain wall windows were new developments of the 1950s – both were a legacy of the Modern Movement – but what was different about the post-war period was the new freedom with which these discoveries and technical advances were exploited. This was a time of unparalleled daring and experiment in the use of light and space within the interior, particularly in the US where some of the most adventurous work was carried out. Whether adopted in full strength or in watered-down form, American "Contemporary" architecture was to have a major influence internationally on the development of the post-war interior. This was equally true in the field of offices and commercial buildings as in domestic dwellings, where the innovative work of architects such as Eero Saarinen and Skidmore, Owings and Merrill resulted in a new corporate aesthetic which was adopted by big business throughout the world.

Many American "Contemporary" houses were either L-shaped, X-shaped or T-shaped as a result of the implementation of ideas about zoning. Zoning was a practice which became popular in the US during the late 1940s whereby different or conflicting areas of activity were isolated into separate wings or branches of the house, so that an activity requiring quiet would not be disturbed by a noisy activity. The most common example of this was the separation of areas of daytime activity such as the kitchen and living room, from areas of night-time activity such as the bedrooms and bathroom. The same thinking was also applied to the work / study areas and relaxation areas, with offices, workshops or studios being distanced from the children's playroom or the main living room where noise-generating activities, such as listening to or making music and watching television, took place. Whatever their layout, however, "Contemporary" interiors were usually economically planned, with each room being created on a scale and placed in a location best suited to its purpose. In American "Contemporary" houses it became common to find the kitchen, dining room and living room designed as one continuous free-flowing space. This open plan multi-purpose living room was almost invariably the largest room in the house. It was often extremely long and sometimes, in two storey houses, unusually tall as well. Full or partial

double-height ceilings were popular at this date, as were open-tread stairs, which usually led directly from the living room to the first floor, sometimes to a mezzanine or balcony area overlooking the main room. Asymmetry was often the natural outcome of this form of arrangement, not only in the placing of fixtures such as fireplaces and staircases but in the grouping of furniture, such as tables and seating, as well.

During the 1950s there was probably greater freedom and flexibility in interior design than there had ever been before. For architects and designers "Contemporary" design was the embodiment of creative release. Filling the void caused by the war and reflecting the new feeling of optimism felt by many people, the "Contemporary" style rapidly achieved widespread popularity. Commercial success led in turn to further development and expansion. The market for "Contemporary" furniture and accessories grew rapidly during the early 1950s. Lighter, leaner and more spindly, "Contemporary" furniture was made of materials such as narrow-gauge steel rods and tapering turned wood. In the UK Ernest Race's ball and spoke *Antelope* chairs, which were originally designed as public seating for the Festival of Britain, typified the "Contemporary" style. Bent plywood was used extensively for seats and seat-backs, and because of advances in technology during the 1940s, the wooden laminates used were now much thinner than during the 1930s, and there was greater flexibility in terms of the shapes into which they could be moulded. In addition to Charles Eames's classic plywood chairs for Herman Miller, Arne Jacobsen's plywood *Ant* and *Series 7* chairs were produced by Fritz Hansen in Denmark from 1952, while in Britain Robin Day's *Hillestak* chairs for Hille, and the *Jason* range of dining chairs designed by the Danish-born Carl Jacobs for Kandya, both dating from 1951, became all-pervasive in "Contemporary" interiors of the time. Most of these chairs were stackable, and many were available with a choice of either metal or wooden legs, and could be purchased in a range of natural wood finishes as well as in mix and match colour-ways.

In terms of the new shapes seen in furniture, lighting and accessories of the 1950s, the main distinguishing characteristic of the "Contemporary" style was its strongly organic curvilinear quality, which was taken to extremes in the anthropomorphic creations of Carlo Mollino and the boldly aerodynamic designs of other Italian furniture designers. Wood was treated as if it was totally malleable, and in chair design considerable attention was paid to minute details of contour and outline. Rounded square and rounded triangular seats and seat backs were particularly prevalent, as in Hans Wegner's three-legged dining chairs and table for Fritz Hansen, and Ilmari Tapiovaara's *Domus* chair for Asko, both made of plywood. Later in the decade, after Charles Eames had mastered the use of plastic for shell seating by reinforcing it with fibreglass, there were apparently no limits on the shapes and structures that could be created. Ultimately this led to the *Tulip* range of pedestal chairs and tables designed by Eero Saarinen for Knoll, in which the traditional four legs were replaced by a single stem. Whatever materials were used, however, exaggerated contours were a common feature of furniture design. This freedom of expression meant that asymmetrical forms, such as cloud-shaped, kidney-shaped or palette-shaped coffee tables, gained widespread acceptance, and unconventional structures,

"Contemporary" Style: living room, Rose Seidler House, Sydney, Australia, c.1950

such as three-legged chairs and tables, were not uncommon either.

However, the impulse towards the organic did not exclusively determine the form of furniture in the 1950s. Between the turn of the 19th century when the organic and naturalistic Art Nouveau style had dominated design, and the middle of the 20th century when organic abstract "Contemporary" design developed, the Modern Movement had intervened. Modernism had an enduring impact on the thinking of the architects and designers who were working during the 1950s, many of whom had been trained during the inter-war years. Rectilinear forms in buildings and furniture were an expression of Modern Movement principles, as was the desire to perfect structures that were modular and which could be made from prefabricated components. These impulses influenced the development of storage furniture during the late 1940s and 1950s, in particular the unit furniture and the Storage wall shelving systems devised by George Nelson and Charles Eames. Interestingly it was these designers who were at the same time creating such strongly organic seating designs for Herman Miller, including the moulded fibreglass swagged legged chair designed by Nelson, and the bent wire chairs designed by Eames. One of the most interesting characteristics of 1950s design was this counterpoint and interplay between the creation of geometric structures and buildings, and organic furniture and accessories.

Although there were common characteristics which

pervaded the "Contemporary" style internationally, it was interpreted in a highly distinctive way and given very different emphases in each individual country depending on the circumstances which prevailed. In Britain the "Contemporary" style was playful and somewhat quirky. It was strongly coloured by the fact that it was associated with an attitude of determined gaiety as the country struggled to break out of a demoralising period of post-war austerity, and self-consciously endeavoured to raise its spirits. Even the Government admitted that the Festival of Britain of 1951 was a propaganda exercise intended to act as "a tonic to the nation". The furnishing fabrics designed by Lucienne Day for firms such as Heal's during the 1950s typify the spirit of the time, especially *Calyx*, produced for the Festival, and it was in the field of surface pattern design – wallpapers, plastic laminates and carpets included – that Britain made its most original contribution to the development of the "Contemporary" style. The bold progressive abstract patterns commissioned by the wallpaper firm, John Line, and the textile manufacturer, David Whitehead, from leading British artists and designers of the day were particularly significant, and were much favoured by architects for use in "Contemporary" interiors.

The Italian interpretation of the "Contemporary" style was, if anything, even more idiosyncratic than that of the British. Isolated during the 1930s because of the political situation which prevailed, Italian architects and designers made a vigorous recovery after the war, re-establishing contacts with the

international design fraternity through the launch of the prestigious Milan Triennale exhibitions in 1948. In visual terms, however, they continued to pursue an independent path after the war and throughout the 1950s they went their own way in defiance of what was going on elsewhere as part of the mainstream international "Contemporary" design movement. Designers who typify this spirit of independence include the architect and furniture designer, Carlo Mollino, with his bizarre and theatrical taste for anatomy and aerodynamic forms; Piero Fornasetti, with his concept of total decoration involving the application of printed patterning to all the surfaces of an interior, including the furniture and accessories; Gio Ponti, who celebrated both tradition and modernity in his work, and who tried his hand in many different media, including ceramics, glass, enamels and furniture; and Gino Sarfatti, who set up his own lighting firm, Arteluce, which led the world in the creation of fantasy lighting. It seems ironic that, although the Italians clearly appreciated the mainstream – the remarkable creative showcase offered to the international community every three years by the Milan Triennale exhibitions is an indication of this – when it came to what they chose to create and produce for themselves, they clearly felt at liberty to go their own way. To design purists, much Italian design of the 1950s seems completely over the top. It was certainly very spirited.

This was very different from the situation in Scandinavia, where there was a much deeper commitment to the social and moral principles underlying "Contemporary" design, and a genuine belief that good design improved the quality of life of those who came into contact with it. In Scandinavia many of the leading applied art manufacturers, such as the Finnish glass firm, Iittala, had already begun to adopt modern design during the 1930s, so the switch to making products exclusively in the "Contemporary" style after World War II was perhaps not so great as elsewhere. However, even taking this into account, the design transformation which took place in the three leading Scandinavian countries – Sweden, Denmark and Finland – over a forty year period between the 1920s and the 1960s is still remarkable. Also noteworthy is the fact that, although each country retained its own distinct design identity during the 1950s, there was a natural corporate identity to the Scandinavian Modern version of the "Contemporary" style. To receptive customers in other countries Scandinavian Modern design represented the ultimate in refinement and sophistication: it was a symbol of creativity tempered by restraint. Designers such as Tapio Wirkkala in Finland (glass, furniture and metalwork), Stig Lindberg in Sweden (ceramics and textiles), and Finn Juhl and Poul Henningsen in Denmark (furniture and lighting respectively) were internationally revered. Distinguished by superb quality materials and high standards of craftsmanship, the Scandinavian Modern aesthetic was all-embracing; it shaped the line of furniture and glass; it dictated the colour, weave and pattern of soft furnishings; and it determined the shape and texture of every domestic accessory in the home, whether useful or purely ornamental. There was thus a remarkable coherence to the Scandinavian Modern "Contemporary" style, and when diverse individual objects were brought together within an interior, they complemented each other because there was a natural affinity and a sympathy between them.

Architecture and furniture design were the fields in which the Americans excelled during the 1940s and 1950s, but the US, being so large geographically, and being such a cultural melting pot in terms of its social make-up, was bound to result in greater diversity of expression. The exiled architects from the Bauhaus strengthened the force of European influence on the East Coast and in the Chicago area where they settled, while architects based on the West Coast looked across the Pacific to Japan and south to South America for inspiration. The influences on American architecture and interiors of the 1950s were as diverse as the origins of the designers themselves: Eero Saarinen from Finland; Richard Neutra from Austria; Mies van der Rohe, Walter Gropius and Marcel Breuer from Germany; and Japanese Americans such as the sculptor and lighting designer, Isamu Noguchi. Of all the eclectic foreign influences on American interior design in the 1950s, the influence of Japan was one of the strongest. The exchange had begun in earnest earlier in the century as a result of contacts established by the much-travelled Frank Lloyd Wright. Richard Neutra visited Japan during the 1930s, and the buildings he saw there were to have a decisive effect on the development of his future work. Neutra in turn influenced a whole group of younger generation California-based architects, who espoused the aesthetics of Japan even more closely: Craig Ellwood in particular, but also Charles Eames, Pierre Koenig and Raphael Soriano. Modular rectilinear post and beam structures with flexible screen-like wall divisions were the main expression of Japanese influence on California Modern interiors; Eames even used *tatami* mats on the floor in his own home at Pacific Palisades in Los Angeles.

This brief survey of "Contemporary" design during the 1950s highlights the importance of assessing the style internationally. It is particularly important to distinguish between the rather narrow British definition of "Contemporary" design as a fashion associated with the Festival of Britain, and "Contemporary" design as a description of a much more widespread international phenomenon, Modernism in a revised form, the Modern Movement in a human guise.

Corridors

Corridors have been an important means of communication in the domestic house for centuries. They have taken various forms, from underground passages to covered walkways, to wide galleries hung with tapestries and portraits, or narrow, snake-like spaces intended to separate and segregate the classes and the sexes from one another.

One of the earliest examples of corridors is described by T. A. Heslop in his discussion of Orford Castle, Suffolk built in 1165 by King Henry II. The castle is laid out with a public reception room and kitchen in the centre and a corridor leading to a private chamber on the ground floor. The first floor is of a similar layout with a private chamber at the end of a private corridor. Such a system allowed for greater privacy for the inhabitants who could retire away from the activity of the central hall and public rooms, from the noise and smells, and close their doors against draughts.

In early medieval houses there is evidence to suggest that while most consisted of one or two rooms opening onto one another, corridors were sometimes used to connect separate rooms. Examples of this in French towns of the early 13th century have been cited by Büttner and Meissner in their *Town*

Houses of Europe (1983). In the Castle of Courcy, built between 1225 and 1240, underground passages connected the defensive walls and the lodgings therein with the central keep, most probably for reasons of defense. Evidence of external corridors, or pentices, has been documented in early 14th century houses in England such as Goodrich Castle, Herefordshire, c.1300, and covered passageways were sometimes arranged around a cloister.

In Italian palazzi of the 15th century, such as the Florentine Palazzo Strozzi, by Giuliano da Sangallo begun in 1489 and not finished until 1536, access to the various rooms of the house is from wide loggias on the ground and first floors which open on the central courtyard. This arrangement suited the warm climate of Italy, and made it possible for the inhabitants to pass from one room to another, without travelling through the primary rooms. Such open loggias or covered passageways were common in courtyard houses of the middle and upper classes throughout the Renaissance.

It is not until the mid- to late 17th century, however, that corridors were given a great deal of consideration by architects and theorists. Around this time corridors came into favour because they could increase the separation between the servants and the family of the house. Such social segregation was considered to be important in the structure of the domestic house and would continue to be so until late in the 19th century. As early as 1624 Henry Wotton in his *The Elements of Architecture*, criticised the *en suite* system in which rooms were designed so as to open on to one another. In a similar arrangement, called the *enfilade* system, the doors of each room are aligned with each other, thereby providing a grand and impressive view through the connected rooms.

Sir Roger Pratt's design of Coleshill, Berkshire, of c.1657 is important as it combined Palladian ideas with the practical needs of a domestic English house. It is arranged as a double pile house with the public rooms in the centre and the private rooms branching off on all four corners. A corridor runs the length of the house through the middle, thereby eliminating the need to walk through the various rooms. Thus residents and servants could pass efficiently through the house without disturbing the occupants in each room. Corridors could limit unwanted interruptions and encounters. As rooms became more specialized in the 18th and 19th centuries, corridors helped to ensure that each room was kept as a separate and more private space. Corridors, together with the servants' back stairs, were also an important means of isolating the servant class from the house owner and his family.

For reasons of social propriety and privacy, the British increasingly abandoned the long *enfilades* of rooms in favour of corridors. The French were also beginning to design more intimate private spaces, although they were slower to relinquish the *enfilade* of rooms. For example in the Hôtel Crozat, in Paris of 1700-02, by Bullet, while suites of rooms continue to open onto each other, a corridor is placed between suites allowing an alternative route to the bedrooms, thereby affording more privacy. Similarly corridors provided access to private suites of rooms assigned to household members.

Thus corridors became not only the connecting threads between rooms and suites of rooms, but also the means of detaching those spaces. They grew more highly developed as the social hierarchy of servants and masters grew more

pronounced and divided, and they provided links between the two social spheres. Corridors were most specialized in 19th-century England. In larger houses, respective corridors were assigned to the family, to the female servants, to the male servants, to the bachelors and to the young women of the house. Such a system was intended to protect against the mingling of the sexes and the classes except in assigned spaces. The floor plans illustrated in Robert Kerr's book *The Gentleman's House* of 1865 clearly identify these areas, which were built into the grander houses by architects such as William Burn and Anthony Salvin. Such sophisticated arrangements of rooms and thoroughfares reflected the intricately structured and carefully ordered social life of Victorian England and were never instigated with such rigour in Europe.

By the turn of the 20th century as houses shrank in size and fewer and fewer servants were employed, the isolating aspect of the corridor was no longer required. Modern domestic house plans, such as those by Frank Lloyd Wright in America, H.M. Baillie Scott in England, Adolf Loos in Austria and Le Corbusier in France, were based on a free flow of space from room to room which was just what corridors had inhibited. Most frequently, corridors are now associated with vast impersonal institutions or dark and musty passages. They are no longer the spine which structures the domestic house but an occasionally necessary means of access.

Cortona, Pietro da 1596–1669

Italian painter and architect

Born Pietro Berrettini in 1596 in the town of Cortona, Pietro da Cortona, with Bernini and Borromini, was one of the principal exponents of Roman Baroque. Trained as a painter, he worked in a variety of different media including fresco painting, architectural decoration and architecture. He is often remembered today primarily as an architect but, like Bernini, he approached architecture in a more painterly manner than most of the architects of his generation. And his fame is based as much upon his architectural decoration as upon his architecture.

Cortona's early work is derivative of that of Lanfranco, Correggio, and his idol, Raphael. However, his own style developed quickly and is apparent in his most famous fresco, the ceiling of the grand salon of the Palazzo Barberini in Rome which he executed between 1633 and 1639. This commission is almost exactly contemporary with the design of S. Luca e S. Martina, Cortona's most mature architectural work, and consequently the period represents the apogee of Cortona's career. The Barberini ceiling required a painting on a colossal scale; the room is approximately 16 metres wide by 22 metres long (52 by 72 feet). Cortona's fresco is a virtuoso performance of illusionary quadratura painting portraying the Triumph of Divine Providence and the claims of the Barberini family to immortality. It is unique in its fusion of sacred content with dynastic allegory and in the technical mastery of the painting. And it was so successful that it influenced decoration in the great palaces of the Catholic world for the next hundred years.

The Barberini ceiling occupies a position in Baroque decoration roughly equivalent to that of Michelangelo's Sistine Chapel ceiling in the High Renaissance. Whereas Michelangelo had used a painted architectural system to divide and compartmentalize his ceiling, Cortona used the same device to unify the various frescoed scenes that sweep between, in front of, and behind the painted architectural framework. Cortona simplified Michelangelo's complex system of ribs and panels into four great painted architectural ribs that rise from the corners of the room to carry a single colossal rectangular frame in which the most important figures of the fresco are located. This central scene, and the four that occupy the panels in the cove beneath it, work with the architectural framework to suggest three spatial layers: the foreground layer which includes the figures that overlap the frame and which read as if they are below it, the frame itself with its *ignudi* and medallions, and the sky and the figures above and behind the architectural frame. Both the architectural framework and the painted scenes emphasize the play of elements in depth. And equally significantly, Cortona eschews individual articulation of elements in favor of a sweeping, moving, dynamic unity of all the parts. These are the characteristics that clearly establish the ceiling as a Baroque rather than a Renaissance masterpiece.

The layered approach to interior design that is characteristic of the Barberini ceiling fresco is also apparent in Cortona's architectural masterpiece of the same period, the church of S. Luca e S. Martina, in Rome. In almost all his architectural

work, Cortona combined straight, crisp elements with lushly curving, sensuous ones and the façade of S. Luca e S. Martina is no exception to this practice. Here Cortona used these elements to express an equilibrium of space and mass: the interior spaces seemingly push out between the rigid corner piers to form curving wall planes. The façade also features the same layering of architectural elements that is the hallmark of the treatment of the interior walls, suggesting that it is composed of a series of architectural planes superimposed upon each other. The various layers are unified by material and color; all are constructed of the rough, golden travertine that was Cortona's favorite building material.

The plan of the church is basically a Greek cross, with the domed, central, vertical axis roughly equal in height to the length of the two horizontal axes. The wall zone is capped by a continuous entablature that carries the eye around the complex interior and gives it unity. Beneath the entablature the wall is made up of three separate superimposed planes, all rendered in white stucco. The outer one runs behind the columns and entablature of the middle plane. The inner one is defined by the projecting pilasters and entablatures of the crossing piers. The back and forth play of these wall systems gives the interior its richly sculptural character.

The half domes of the apses and the dome above the crossing are decorated with heavy sculptural features: powerful ribs are superimposed upon a coffered surface and aedicular window frames, flanked by consoles and capped with broken pediments which break into the coffered surfaces. The coffers seem to disappear behind the ribs, emphasizing the layered character of the design.

Discussion of Cortona's significance as a decorator is incomplete without some mention of the shift in manner that is visible in his later works. Chief among these are the five rooms he decorated during the 1640s for the Medici in the Pitti Palace, their ducal palace in Florence. These rooms illustrate a dramatic change in style from the Barberini ceiling. Early in the work, Cortona went to Venice to study the work of Veronese. In Venice, he was impressed by the ceilings of the great Venetian salons. Henceforth, the sweeping, overlapping, unified, quadratura composition that characterizes the Barberini ceiling would give way to richly sculpted stucco architectural frames decorated with life-size figures in the round, usually in white in contrast to the gilded architectural frame, forming precise, if heavy, compartments for individual painted pictures. Cortona has returned to an organizational system much closer to that of Michelangelo. Moreover, the palette used for the pictures is strongly Venetian; glowing bright colors play against skies of blue and gold. Cortona was never tempted by the chiaroscuro of the Caravagisti; instead his color is much more closely related to that used by Bernini in his architectural decoration. The Pitti Palace rooms were to prove singularly important in the history of interior decoration; they constitute the prototypes for the French style of Charles Le Brun which was copied widely throughout Europe.

Biography

Pietro Berrettini. Born in Cortona, 1 November 1596, the son of a stonemason. Trained at Andrea Commodi's studio, c.1610–12. Went to Rome with Commodi, 1612; moved to Baccio Ciampi's studio, 1614. Met the Florentine artists Cigoli, Passignano and Ciampelli; Cardinal Giulio Sacchetti and his brother Marcello, Cortona's main patrons from 1623, were in the papal circle of the Barberini and Cassiano del Pozzo. First important commission from Marcello Sacchetti, 1626. Active as an architect, late 1620s. Active for Barberini family from 1632. Festival regalia for "Quarantore" (S. Lorenzo in Damaso, Rome), 1633. Church architecture from 1634. Accompanied Cardinal Giulio Sacchetti to Bologna, and briefly visited Venice, 1637. Summoned to Florence by Grand Duke Ferdinand II de' Medici, 1637, returning to Rome, December ?1637. In Florence, 1640–47. Settled in Rome, 1647. Received important commissions from Pope Innocent X, c.1651. Under Alexander VII (Pope, 1655–67) active as architect of Roman churches; abandoned secular decoration. Presented design to Louis XIV for east façade of Louvre (rejected), 1664. Principal of Accademia di San Luca, 1634–38. Died 16 May 1669; buried in church of S. Luca e S. Martina, Rome.

Selected Works

Cortona's ceiling decorations at Palazzo Barberini and Palazzo Doria-Pamphilij survive *in situ*.

Interiors

- c.1616 Villa Arrigoni (now Muti), Frascati (fresco decoration)
- 1622–23 Palazzo Mattei, Rome (frescoes in the gallery): Mattei family
- 1626–29 Villa Chigi (formerly Sacchetti), Castel Fusano, near Ostia (gallery ceiling and chapel): Marcello Sacchetti
- 1633–39 Palazzo Barberini, Rome (Great Salone ceiling, and tapestries): Cardinal Barberini
- 1634–69 SS Luca e Martina, Rome (building and interiors)
- 1637 Palazzo Pitti, Florence (Sala della Stufa): Grand Duke Ferdinand II de' Medici
- 1641–47 Palazzo Pitti, Florence (5 rooms: Venus, Jupiter, Mars and Apollo, Saturn): Grand Duke Ferdinand II de' Medici
- 1651–54 Palazzo Doria-Pamphilij, Rome (ceiling of gallery): Pope Innocent X

Cotte, Robert de 1656–1735

French architect

Robert de Cotte was arguably the most important French architect and designer in the early 18th century. His work is particularly associated with the period after 1715 of the regency of Louis XV, known as the Régence. Like many architects of the time de Cotte was a member of the workshop of Jules Hardouin-Mansart, working there by 1676. He was to become Mansart's most valued assistant in the Service des Bâtiments du Roi, especially after 1699 when Mansart was named Surintendant and enlarged the Bureau des Desseins which supplied the Bâtiments with drawings and designs. In 1699 de Cotte was named Architecte Ordinaire, Mansart's second in command, in the offices Mansart set up at Versailles, Marly and Paris. And when Mansart died in 1708, de Cotte was appointed his successor, Premier Architecte, a position that he held for the next 25 years. His output was prodigious, and in addition to the works executed for the court, de Cotte ran a thriving private practice serving both French and foreign patrons. It was largely through his efforts that the French court style began increasingly to supplant the influence of Italian architecture and design in Europe during this period.

De Cotte was born into a family of builders. His grandfather had been architect to Louis XIII, his father was also an architect, and in 1677 he married one of Mansart's sister-in-laws thus allying himself to one of the most powerful architectural dynasties in France. In 1702 he received *lettres de noblesse* from Louis XIV. In addition, like many other architects of the period, de Cotte amassed a large personal fortune through various speculative building projects. His family's rapid rise through the social hierarchy culminated with the career of his son, the architect Jules-Robert de Cotte (1683–1767) who purchased the estate and title of Baron de Réveillon from the Marquis d'Argenson.

De Cotte's early work was clearly indebted to the example of Mansart, especially in the various urban plans that he supervised. At the Place Vendôme, Paris (1700–35), for instance, Mansart had been responsible for a first design but the final octagonal plan was determined by de Cotte. The same scheme was repeated at the Place du Dôme des Invalides; once again Mansart had prepared the initial design in 1676 but when the square was being finished in 1698 de Cotte supervised the work and was able to fix the final form that it would take. And at Lyon, at the Place Bellecour (1711–13), Mansart's visionary plan was rejected in favour of a simpler and more practical design prepared by de Cotte.

De Cotte's private projects for hôtels and town houses date from the second decade of the 18th century and were especially numerous after 1720 when the boundaries of Paris expanded westwards. Here again de Cotte followed Mansart's classical model but he adapted this model to suit the demands of propriety and expense. At the Hôtel de Lude, Paris (1710), his first private house, the owner was a successful banker and much attention was paid to the idea of display; at the Hôtel d'Estrées (1711–13), the plan was more concerned with convenience, with the various apartments being made suitable for a range of different functions. In both cases, the exteriors were devoid of columns and pilasters and were plain and reserved. The same

was true of the designs for the Hôtel de Torcy, Paris (c.1713), and for those of the Hôtel du Maine (1716–19) where de Cotte set all the various elements including the end pavilions and the entrance front under one large, simple roof.

The exact nature of de Cotte's contribution to interior design is quite difficult to determine. From the time of his promotion to Architecte Ordinaire, he had at his disposal a large team of talented assistants the most well-known of whom were the designer Pierre Le Pautre and the sculptor François-Antoine Vassé. These assistants were responsible for committing de Cotte's ideas to paper and there has been considerable speculation as to the extent of de Cotte's involvement within interiors. Contemporaries sometimes questioned whether he was responsible for any of the designs produced by the Bâtiments du Roi, but the historian Robert Neuman, who has made a detailed study of de Cotte's drawings, suggests that he played an important role in the broad conception of the interior detailing. He normally determined the design of the architectural framework, the subdivision of the wall panels or other components, and the location of relief carving, paintings and mirrors. The finer details and decorative elements were provided by one of the dessinateurs working in the Bâtiments, or a sculptor in an independent workshop who worked up de Cotte's preliminary sketches into full-scale drawings. De Cotte's sketches of chimneypieces and overmantels for his own apartment in Paris (1721–22) also suggest that he continued to play an active part in the design of some decorative features. And finally, he imposed a house style upon his dessinateurs so that even when the drawings were executed by other hands they were clearly indebted to his overall conception and ideas.

De Cotte's approach to architecture and design marked a new phase in the history of architectural theory. This was elaborated in his ideal of *la belle architecture* which shows his work to have been less dependent upon classical rules deriving from ancient or Renaissance prototypes than on the exercise of good judgment and taste. Certain terms were deemed especially important: *bienséance*, or decorum, an idea of the clear relationship of the form and purpose of a building; *convenance*, an idea closely related to *bienséance* which argued that all the parts of a building, the exterior elevation, the location of the rooms, the choice of materials and the decoration of the interior, should suit the needs, the social status and wealth of the patron; and *distribution*, the proper planning of the rooms which was considered the most important responsibility of the architect. His concern with decorum and appropriateness led de Cotte to regard each commission as what has been called a typological problem and to argue that each building could be said to have its own tradition of planning and iconography. The influence of these ideas is evident in Jacques-François Blondel's important treatise, the *Cours d'Architecture* (1771–77), which developed the notion of *distribution* in particular, and which grouped all kinds of buildings under the three general categories of private dwellings, public buildings and ecclesiastical edifices.

During the 1720s de Cotte was involved in the design of three Episcopal Palaces outside Paris, at Châlons-sur-Marne (1719–20), at Verdun (1724) and at Strasbourg (1731–35). In keeping with prevailing codes of social hierarchy and decorum, the Bishop's apartment at Strasbourg was modest, but that for the king, the Grand Appartement, was more lavish and was set

Cotte: design for lacquered room, 1717

along the river side of the building. De Cotte also prepared several designs for palaces for European nobility. Few were built but all had longitudinal axes in the plans and radiating avenues for the gardens similar to those at Versailles. The buildings were variations on simple French plans: a simple block at the Château de Rivoli (c.1700) built for the Duke of Savoy; a U-shaped plan at Chanteloup (c.1711) built for the Princess Orsini; and a central plan at the Château of Poppelsdorf, Bonn (1715–23), and at the Château of Tilbourg in the Netherlands (c.1715). All these plans included imposing state rooms but, unlike the designs of the previous century, they also included more functional arrangements in the private rooms and connecting corridors that offered some privacy.

In 1715 de Cotte planned two palaces for the grandson of Louis XV, Philip V of Spain. Buenretiro I was devised as a simple U-shaped building, while the design of Buenretiro II was in the form of a vast cross that could accommodate two sets of apartments (joined by a single set of dressing rooms) which were intended to be inhabited alternately in summer and winter. Although these proposals were unexecuted, they had a significant impact on architectural design in Italy and were the

starting point for Luigi Vanvitelli's Royal Palace of Caserta, Naples (1751–74).

De Cotte was in charge of several ecclesiastical projects, the most notable being the decoration of the chapel at Versailles (1708–10) and the decoration of the choir of Notre Dame, Paris (1708–14); much of the work in these two schemes was carried out by Vassé and Le Pautre. He also designed several large complexes of buildings including the Parisian garrisons for the Mousquetaires Noires (1699) and the Mousquetaires Gris (1716–20).

Many of de Cotte's buildings have been demolished or, like the Episcopal Palace at Strasbourg, have been substantially altered. Yet, the evidence from surviving works, drawings and contemporary accounts suggests that he was skilled in designing a simple, balanced form of architecture that was well-suited to the new breed of client who required comfort as well as a setting appropriate to public life. While much of his architectural language was quite traditional or familiar, his interiors illustrate the introduction of a more varied style of organisation. And in the work of his assistants, like Vassé, the decorative details and ornament are less two-dimensional and include

much bolder reliefs than that characteristic of the older classical style of French architecture. This work heralds the arrival of the Rococo style of design.

DAVID CAST

Biography

Born in Paris in 1656, the son of an architect, Charles de Cotte. Trained as a stone-mason. Married the sister-in-law of Jules Hardouin-Mansart (1646–1708), 1677: son, the architect Jules-Robert de Cotte (1683–1767). Working in the offices of Jules Hardouin-Mansart by 1676; travelled to Italy with the architect Jacques V Gabriel, 1689; appointed Architecte Ordinaire, and director, Département de Paris, and director, Académie Royale d'Architecture, 1699; succeeded Hardouin-Mansart as Premier Architecte du Roi, 1708–34. Ennobled by Louis XIV in 1702. Died in Paris, 15 July 1735.

Selected Works

The de Cotte Collection, comprising several thousand documents, drawings and designs issued by de Cotte's office, is divided between the Bibliothèque Nationale, and the Bibliothèque de l'Institut de France, Paris. For a full account of de Cotte's architectural commissions see Neuman 1994.

Interiors

- 1703 Hôtel de Lionne, Paris (interior remodelling): Chancellor de Pontchartrain
- 1708–09 Château Neuf, Meudon (interiors including the Dauphin's apartments)
- 1708–10 Chapelle Royale, Versailles (decoration, with A. Vassé)
- 1708–14 Notre Dame, Paris (decoration of the choir, with A. Vassé)
- 1709 & 1721–22 Château de Saverne, Alsace (decoration, including the Appartement de Parade)
- 1711–13 Hôtel d'Estrées, Paris (building and interiors): Duchesse d'Estrées
- 1713–19 Hôtel de la Vrillière (later Hôtel de Toulouse), Paris (remodelling of original building by F. Mansart; interiors with A. Vassé)
- 1714 Hôtel de Gramont, Besançon (interiors)
- c.1715–17 Buenretiro I and Buenretiro II, outside Madrid (unexecuted designs for the building and interiors): Philip V
- 1716–17 Electoral Palace, Bonn (interiors)
- c.1716–19 Hôtel du Maine, Paris (building and interiors): Duc and Duchesse du Maine
- 1717 Hôtel de Bourvalais, Paris (remodelling and interiors including the Grand Salon)
- 1719–20 Palais Episcopaux, Châlons-sur-Marne (building and interiors; unfinished)
- 1721–22 Hôtel de Cotte, Paris (building and interiors)
- 1721–35 Cabinet des Médailles, Bibliothèque du Roi, Paris (with Jules-Robert de Cotte; not completed until 1741)
- 1724–35 Palais Episcopaux, Verdun (building and interiors; not completed until 1739)
- 1725–36 Versailles (remodelling of interiors, including the Chambre de la Reine, and the Salon d'Hercule, with A. Vassé)
- 1731–35 Palais Rohan, Strasbourg (building and interiors including the Chambre du Roi; not completed until 1742)

Cottier, Daniel 1838–1891

Scottish interior decorator, stained-glass designer and antique dealer

Daniel Cottier was appropriately described as a man who “thought in Continents” and his influence as an interior decorator, stained-glass designer and dealer in fine and decorative arts was felt not only in Britain, but in North America and Australia. His impact spread outwards from the fashionable elites of Scotland, and by 1873 he had established offices and partnerships in London, Sydney, Melbourne and New York, backed up by a European network of agents and contacts. In all these centres Cottier played a leading role in disseminating the artistic ideas of the Aesthetic Movement, establishing a contemporary taste in interiors, and introducing paintings of the Barbizon and Hague Schools to homes of the international art-buying public.

Cottier traded on a sophisticated colour sense which was rooted in technical skills acquired in the 1850s during his Glasgow apprenticeship as a stained-glass artist and house painter (probably with Cairney & Son). There followed a couple of years in London where, at the Working Men’s College in Red Lion Square, he absorbed Ruskin’s fiery invective and witnessed the inception of Morris, Marshall & Faulkner. Returning to Scotland in 1862 he worked for two years as an assistant manager with Field & Allan, leading stained-glass artists in Edinburgh, before setting up on his own account as a “glass painter and mural decorator” luring the talented Andrew Wells to join him. Typical of Cottier’s charismatic, outgoing personality was the instant friendship he struck up on a train journey with the collector John Forbes White, which resulted in a series of interior and stained glass commissions in Aberdeen. Even more significant for Cottier’s subsequent career as a dealer was White’s interest in contemporary Dutch and French painting, and his connections with prominent European artists, collectors and dealers.

Cottier kept on the Edinburgh studio until 1869. By this time he had also established himself back in Glasgow where he had completed a formative series of daring, polychromatic church interiors in collaboration with the architects John James Stevenson (1831–1908), William Leiper (1839–1916) and Alexander “Greek” Thomson (1817–75). In his decoration of Stevenson’s Townhead Church (1865–66) Cottier clearly demonstrated his receptivity to the work of Burges, Morris and Jones. The strongly coloured stencilling and stained glass complemented the architecture with an assured blend of muscular Gothic, classical and exotic styles. Equally startling were the colour combinations and boldly geometric designs applied to Leiper’s Dowanhill Church (1865–66). Like Cottier, Leiper was not long returned from London where he had been a fringe member of the Burges-Godwin set, whose influence was apparent in the use of painted arcading, ringed shafts and miniature rooves in the theatrical pulpit and in the star-studded blue ceiling. The third of these ecclesiastical commissions, the elaboration of Thomson’s overall design for the interior of Queen’s Park Church (1867–69), established Cottier as a “consummate colourist”. To his former mentor, the London artist Ford Madox Brown, it was a revelation, and demonstrated the extent to which Cottier had outstripped his

London training with “a range of performance beyond that of any other modern artist. Here line and colouring are suggestive of paradise itself. I now know what all along has been wrong with my ceilings. Well done Glasgow! I put ... this Thomson-Cottier church above everything I have seen in modern Europe” (*Glasgow Evening Times*, 19 October 1893).

In 1869 Cottier moved his main base to London, initially in partnership with old friends from Glasgow – John McKean Brydon, Bruce Talbert and William Wallace. He was no longer confining his energies to glass painting and decorative work but broadening out to encompass the manufacture of furniture, textiles and painted ceramics. Being close to the heart of the leading Aesthetic circles enhanced his reputation. It was he, for example, who first gave Rhoda and Agnes Garrett studio space and a grounding in decorative design, perhaps on account of his working friendship with their relative J.J. Stevenson. During frequent trips to the Continent he began dealing in contemporary Dutch and French painting, and persuaded the dealer Van Wisselingh to become manager of the London Gallery. Through this connection the Dutch artist Matthijs Maris came to live with Cottier in 1877, producing both paintings and stained glass for the firm’s various outlets. At the same time Cottier was continuing to work back in Scotland on a series of striking villa interiors in a mature Aesthetic style (Cairndhu, Helensburgh; Colearn House and Ruthven Towers, Auchterarder).

Having been born into a seafaring family in the west of Scotland, Cottier was no stranger to international trade and travel, and throughout his life cultivated the air of an old sea-dog, apparently looking “more like an ideal coasting skipper than an artist.” He took advantage of rail and steamer routes to expand his affairs into an international market, and in 1873 set up an Australian operation, Lyon & Cottier, with branches in Sydney and Melbourne. The ground had been prepared by John Lamb Lyon, a fellow apprentice in Glasgow and London who had emigrated in 1861. The long-term side effects of working with noxious pigments and processes combined with the notoriously dank weather in the west of Scotland made emigration appealing on health grounds for many decorators. Cottier himself suffered from a recurrent rheumatic fever (which eventually killed him), and both Andrew Wells and Charles Gow spent a convalescent spell working for him in Australia before returning to Glasgow. The firm was instantly successful and an extensive folio of designs now in the Mitchell Library, Melbourne, suggests that they virtually monopolised high-class commissions for decorative work there during the 1870s and 1880s.

Cottier’s New York branch established in 1873 was also a runaway success, helped by Clarence Cook as publicist. In a series of magazine articles subsequently published as a best-selling book *The House Beautiful* (1878), Cook repeatedly praised the firm’s Artistic furnishings. Some designs were in fact versions of Godwin’s furniture which Cottier had initially imported and later manufactured in New York. On significant Aesthetic interiors like the Boston Trinity Church and the New York Union League Club, Cottier worked alongside American designers John La Farge and Louis Comfort Tiffany. This side of Cottier’s business is well documented in the catalogue *In Pursuit of Beauty* (1986) which also mentions interiors for the homes of F.W. Stephens and Joseph Decker and furniture for

Catherine Lorillard Wolfe's Newport, Rhode Island "cottage". The North American operation was managed and subsequently owned by James Smith Inglis who had followed Cottier from Glasgow in 1873.

Wherever he went Cottier attracted a following and connected with the most interesting artists, architects, designers, critics and collectors around. His various enterprises provided a magnet for a younger generation of talent, and a stepping-stone to other practices. In particular, untried Scottish designers seeking openings in London or abroad received a ready welcome. Cottier also helped to bring on indigenous talent in America and Australia, which would eventually oust British firms like his own from their pre-eminent position. In Glasgow, his contribution to the pool of decorative skills and successful collaboration with adventurous patrons added to the growing reputation of the city as an international centre for progressive design. Integrated schemes incorporating self consciously "artistic" paint effects and distinctive stained glass were hallmarks of both Cottier interiors and the subsequent Glasgow Style. The atmospheric qualities and subtle coloration of painters like Corot and the "grey School" of Dutch painters whom Cottier promoted, enriched the visual vocabulary of interior designers such as George Walton, Charles Rennie Mackintosh, the Macdonald sisters and George Logan. Many of the decorators and stained-glass artists (Hugh McCulloch, Charles Gow, Andrew Wells) who went on to employ or work with Mackintosh and his associates had emerged from the Cottier stable.

JULIET KINCHIN

Biography

Born in Glasgow, 1838. Apprenticed to the stained-glass manufacturer David Kier (1802–64), Glasgow; attended lectures at John Ruskin's Working Men's College, London, c.1860–62. Married Marion Field, 1866. Worked for stained-glass manufacturers Field and Allan, Edinburgh, 1862–64. Established his own studio, with Andrew Wells, George Street, Edinburgh, 1864; active as a stained-glass designer and interior decorator, Glasgow, 1867–69; established Cottier & Company Art Furniture Makers, Glass and Tile Painters, London, 1869; listed as Cottier & Co., Upholsterers, Fine Cabinet Makers, Glass Stainers, Art Rooms, 144 Fifth Avenue, New York City, 1873; set up decorating and furniture business with John Lamb Lyon (Lyon & Cottier) with branches in Sydney and Melbourne, 1873. Designed furniture and interiors from c.1870; active as a dealer in paintings in London and New York from 1873. Died in Jacksonville, Florida, 1891; British and American business managed by James Inglis, 1873–1907; Cottier & Co. survived until 1915.

Selected Works

Few records, drawings or authenticated examples of Cottier's work in Europe and America survive, but examples of his stained glass are in the Victoria and Albert Museum and in situ in a number of churches, including the Cathedral of Saint Machar, Aberdeen, Trinity Church, Boston, and the Church of the Incarnation, Madison Avenue, New York, and in secular settings at Harvard University, and the New York Society Library. An extensive folio of designs relating to his work in Australia is in the Mitchell Library, Melbourne.

Interiors

- 1865–66 Townhead Church, Glasgow (stained glass and stencilled decoration; building by J.J. Stevenson)
- 1867–69 Queen's Park Church, Glasgow (stained glass and decoration; building by A. Thompson)
- 1870s Cairndhu, Helensburgh, Scotland (interiors)

- 1870s Colearn House, Auchterarder, Scotland (interiors including stained glass): Alexander Mackintosh
- 1878 New York Society Library, New York (stained glass, Green Memorial Alcove)
- 1880s Memorial Hall, Harvard University (stained glass)
- 1881 Union League Club, New York (library interiors including furniture and stained glass)
- early 1880s F.W. Stephens House, New York (interiors)
- early 1880s Joseph Deckers house, New York (interiors)

Crace & Son

British firm of decorators, designers and cabinet-makers, 1768–1899

In the 18th century in Britain, the work of the interior designer could be done by several different types of craftsmen, including cabinet-makers and upholders. This work involved the design and supply of furniture and soft furnishings; the re-gilding of furniture and frames; the restoration and re-hanging of pictures; and often the entire arrangement of an interior scheme. Into this category fell Edward Crace, a leading coach decorator of Long Acre, Covent Garden, London, when he established a decorating business in 1768. The Crace firm of decorators was to be remarkable for its longevity and the

breadth of its work. It was continued by five successive generations until its closure in 1899 by John Dibblee Crace, the great-great-grandson of Edward.

As a successful coach decorator, Crace was able to draw upon an established client base among the gentry and aristocracy for his new venture into interior decorating. Information on his career is sparse, and only one interior by him has been recorded, in an oil painting by the studio of Zoffany. This was of the main interior of the Pantheon in Oxford Street, London, built in 1770–72 by the architect James Wyatt as a public meeting place in the new Neo-Classical style. In the Zoffany painting, Edward Crace's decoration is clearly visible beneath the vast central dome, including large *giallo antico* columns painted in *scagliola* and the principal decorative features of pendentives in grisaille work with arabesques supporting cameos in the antique manner. Horace Walpole likened these to Raphael's decoration at the Vatican. It is known that Edward Crace also supplied a large suite of gilt furniture for the Pantheon, although this has since disappeared, along with the building itself.

By 1778 Edward Crace had become curator of the extensive paintings collection of George III, and his eldest son, John Crace, took over the running of the Crace decorating business at 55 Great Queen Street, London. John Crace, who was assisted in business by his good looks, extrovert personality, and early marriage to an heiress, seems to have had about fifteen regular employees, including a cousin of the same name. While bills in the Victoria and Albert Museum archive indicate that he executed much routine painting and decorating work during the 1780s, by 1794 he had become a member of the team working for John Soane at the Bank of England. Crace designed a ceiling in the Breakfast Room of 12 Lincoln's Inn Fields (now part of Sir John Soane's Museum), which he decorated c.1794 for Soane. It has been recovered from beneath many layers of paint. The ceiling of the Back Parlour at Soane's country house, Pitzhanger Manor in Ealing, has been repainted recently to Crace's design after a watercolour by J.M. Gandy. This was executed c.1802. Both ceilings were of trellis design with vines and flowers, following an established French Neo-Classical type.

By 1790 John Crace was decorating interiors at Carlton House, the legendary London house of the Prince of Wales, demolished in 1827. The architect was Henry Holland, with whom John Crace worked closely on a number of occasions. In 1794 Crace was joined by his eldest son, Frederick, then 15 years old, who was noticed by the Prince for his skill in gilding the staircase at Carlton House. Frederick later remarked that his father's contribution to the history of English interiors had been to reintroduce the decorative techniques of graining, marbling, and illusionistic painting. All these techniques the Craces learned while working at Carlton House alongside the French decorative artists Jean Jacques Boileau and his assistant, Louis Delabrière. The Italian *scagliola* artist Bartoli was also an influence. The Crace decoration at Carlton House was unfortunately lost by 1806 in a new scheme of decoration, directed by Walsh Porter.

In 1793 Thomas Sheraton had published the Chinese Drawing Room of Carlton House, the work of Henry Holland the architect and Crace the decorator and contemporary to their Chinese Dairy at Woburn Abbey, Bedfordshire (finished

c.1789). John Crace not only collected Chinese *objets d'art* but had a considerable library of topographical books on the Orient. This knowledge was put to use by the Prince of Wales between 1801 and 1804 in the first phase of Chinoiserie decoration at the Royal Pavilion, Brighton, the Prince's famed pleasure palace on the Sussex coast where he entertained lavishly. A number of boldly drawn and coloured designs for the Pavilion in the Cooper-Hewitt Museum in New York can be attributed to John Crace by virtue of their similarity to the painted interior of the Woburn Dairy. In addition to designing and executing interiors for the Prince, John Crace also imported a considerable number of Chinese objects, lacquer, and furniture for the Pavilion.

Frederick Crace was also much involved during this phase of decoration at Brighton. He seems to have acted as foreman for his father's men, although one interior designed by him in 1801 is known. This was a tented bed alcove, with en suite breakfast and dressing rooms in the newest French manner, illustrating his precocious talent. The light, sure touch and sophisticated use of colour developed by Frederick Crace while working at Brighton Pavilion distinguish his later interiors. Typically, the Prince became dissatisfied with his early exercise in Chinoiserie and decided to re-do the Pavilion interiors, beginning in 1815. Until c.1822 this work was led by Frederick Crace, with some 34 assistants. The most spectacular of these interiors, and the masterpiece of Crace, was the gas-lit Music Room, completed in 1820, with mural panels in imitation of scarlet and gold lacquer (executed by a specialist French painter), Chinese-style gasoliers based closely upon Chinese export glass, and a large domed ceiling decorated with silvered "dragon" scales. The interior has been restored, replete with a carpet re-woven to Crace's designs, after a severe arson attack in 1975 and damage from a hurricane in 1987; the original suite of furniture by Bailey and Saunders survives in the Royal Collection. The Music Room was the most talked-about interior in Europe in its day, not least for the entertainments which took place within it.

Shortly after completing the Music Room, the then-George IV transferred Frederick Crace to Windsor Castle, which was being extensively remodelled by Jeffry Wyattville. Contemporary newspaper accounts and diaries suggest that Crace executed a great deal of painting and gilding, although few specifics are known about this work. Crace did, however, contribute to the new Rococo Revival and Gothic interiors by Wyattville, including the State Rooms where a teenager named Augustus Welby Pugin was employed in designing furniture. The experience of Windsor seems to have sparked an interest in the Gothic on the part of Frederick Crace, who went on to decorate a townhouse for the novelist and antiquary Edward Bulwer-Lytton in a heraldic style, followed by heraldic decorations in the state rooms of Taymouth Castle, Perthshire, Scotland, in conjunction with his eldest son, John Gregory Crace.

J.G. Crace began working for his father in 1825 at the age of 16, acting as the firm's foreman. In 1830 he inherited cash and property from his mother's estate, enabling him to become a full partner with his father, trading as "Frederick Crace & Son" from 14 Wigmore Street (renumbered to 38 in 1859), Cavendish Square, London, premises they occupied from 1827 until 1899. At the time of their partnership, J.G. Crace had

Crace & Sons: state drawing room, Knebworth House, Hertfordshire, 1844

become worried about the state of the business. His father had been occupied for some time almost exclusively with commissions for George IV, who was notoriously slow in paying his bills, and their country-house clientele had fallen off. The younger Crace was determined to rebuild the business, beginning with new showrooms at Wigmore Street.

As he and his father considered French decoration to be superior to that in England at the time, he went to Paris on a study-tour of contemporary French interiors in 1837, returning to decorate a principal showroom in the French Renaissance style. Invitations were then sent out to prospective clients inviting them to a series of open-house evenings which proved to be very successful. Among the first, and certainly the most important, of J.G. Crace's patrons, was Andrew Spencer Cavendish, the 6th Duke of Devonshire, who employed Crace from 1840 until the mid-1850s, beginning at Devonshire House in London and his seat, Chatsworth, in Derbyshire. For the former, Crace redecorated the Saloon in a sumptuous mixture of French Baroque and English Palladian motifs, while at Chatsworth he created a private library for the Duke, who wished to have a room in the "new style" of decoration, what Crace was to term "Old French". The wall and ceiling decoration was inspired by French Neo-Classicism in its arabesques of pastel colours, while a suite of maple and amaranth marquetry furniture was designed by Crace for the room. Crace later remarked it was the Duke who had suggested he add cabinet-making to his business, and workshops in Little Welbeck Street and Welbeck Mews, behind the Wigmore Street showrooms, were established.

In 1841 Crace had collaborated with his father in designing a suite of state rooms for Taymouth Castle, decorated to receive the young Queen Victoria and Prince Albert on a state visit. At Taymouth Crace began what was to become a life-long interest in the Gothic style of decoration, which was strongly reinforced by his introduction in 1843 to A.W.N. Pugin by Lord Shrewsbury when both were working at Alton Towers, Staffordshire.

Also in 1843, Crace travelled to Munich and was greatly excited by the rich use of polychromy he found there in the Neo-Classical interiors of Leo von Klenze and his team of decorative artists. Crace presented his findings in a lecture to the Royal Institute of British Architects, in which he recognised that the use of contrasting bold colours could enhance the effect and clarify the structure of architecture and interiors, especially when combined with the use of repeated decorative patterns. This approach to interiors was followed by Crace for the rest of his career.

By early in 1844 J.G. Crace had entered into a decorating partnership with A.W.N. Pugin, and their joint commissions were still in progress at the latter's death in 1852. Pugin's passion and genius for medieval design had an immediate impact upon the Gothic style of Crace, while Crace provided his years of experience in decorating with a long-established and well-known family firm, as well as his strong interest in the proper use of colour in interiors. This is demonstrated clearly in a letter Crace wrote to *The Builder* in 1855, responding to criticisms of the Saloon at Chirk Castle, Clywd, which he had decorated with Pugin in 1846–48. He defended his scheme of a strong blue ceiling with green and gold walls, saying the colouring had been chosen by him to harmonise

with the existing collection of portrait paintings, whose varnish had yellowed, concluding that, "Any two colours may be brought together by a proper modulation of tone, and interposition of suitable contrast between them." This concisely sums up the Crace approach to interiors throughout the 19th century.

The later 1840s were, for J.G. Crace, dominated by his work in conjunction with Pugin. In 1846 Frederick Crace & Son were officially awarded a contract by the Office of Works for decorating the new Palace of Westminster. This work was to continue for more than twenty years, encompassing the supplying of an enormous number of wallpapers, carpets and textiles, as well as executing painted interior decoration to Pugin's designs.

Crace worked closely with the Pugin "team" of Minton, Myers, and Hardman, all of whom collaborated in the production of the Medieval Court at the London Exhibition of 1851 where the Gothic style of Pugin and his colleagues achieved its greatest public acclaim. Elegant furniture with coloured marquetry from one of Pugin and Crace's most satisfying collaborations, Eastnor Castle, Herefordshire (1849–50) was exhibited, along with a large oak cabinet (now in the Victoria and Albert Museum) and many other objects.

Crace amassed a large number of sketches and designs by Pugin in his workshops which were used by the firm as the basis for their Gothic furniture production until well into the 1860s, while Pugin-designed textiles and wallpapers were supplied by the Crace firm until its closure in 1899. In this way, the imprint of Pugin upon the firm's work was large. However, Crace remained committed to the practice of other styles of decoration, aside from the Gothic. Owing to the influence of his son and successor, John Dibblee Crace, he experimented with the Renaissance and Islamic styles, for example. An Islamic character was given to the refreshment room of the Manchester Art Treasures Exhibition, held in 1857 in Trafford Park, and decorated by Crace. It was doubtless the success of this enterprise that led to his being awarded, at the last minute, the contract to decorate the controversial exhibition building for the London Exhibition of 1862.

In 1862 the reputation of the Crace firm was undoubtedly at its height. J.G. Crace not only decorated the exhibition building but was a principal exhibitor and a juror. He went on to international acclaim at the 1867 Exposition in Paris, receiving a medal from the Imperial Commission. Through these exhibitions his eldest son, John Dibblee Crace, was introduced to the public by means of his subtle but rich designs for furniture in the Gothic and Renaissance styles. In 1877 J.D. Crace became a partner with his father, and the two remained on the closest terms until the elder's death in 1889, when the younger man remarked that much of his pleasure in the business was lost.

The artistic talent of J.D. Crace was, in many respects, similar to that of his grandfather Frederick Crace. It was a precocious talent, resulting in a rapid but delicate style of draughtsmanship and a predilection for subtle colour combinations. J.D. Crace was certainly influenced by the colour theory of his father, but his passion for Italian interiors of the 16th century resulted in his own book on the subject, *The Art of Colour Decoration*, in 1912. Here he put forth his view that no artists before or since had produced better architectural

decoration than those of the Italian Renaissance and Mannerist periods. He came to know these interiors intimately through frequent study-tours to Italy throughout his life.

J.D. Crace was fortunate in finding a wealthy patron who shared his views in the person of the 4th Marquess of Bath. Crace and Lord Bath collaborated in designing a series of state and private rooms at Longleat House, Wiltshire, beginning in 1874. By the time work was finished, in 1882, these interiors ranked among the finest examples of the Renaissance Revival in Europe, and they comprise the most complete example of the work of the Crace firm. Not only ceiling and wall decoration, but curtains, upholstery, fittings and furnishings remain *in situ*, all executed by Crace's men to his designs, in conjunction with the ideas and suggestions of Lord Bath.

Of the state rooms on the first floor of Longleat, J.D. Crace's masterpiece is the State Dining Room, begun in 1875, with a ceiling based upon the Great Council Chamber of the Ducal Palace in Venice. Jackson & Sons of Rathbone Place, London, executed the gilded mouldings of the ceiling panels in "composition", into which some of Lord Bath's collection of Venetian paintings was inserted, while the walls were decorated with antique gilded and silvered Spanish leather. On the ground floor, in the private rooms of the east range of the house, Crace decorated the Red Library in 1879 in the manner of Giulio Romano, whose work he much admired. Throughout the ground floor rooms were marquetry doors and fittings of walnut and fruitwoods in delicate arabesques designed by Crace and made by a workshop in Florence.

J.D. Crace had little sympathy for the Arts and Crafts designers, whom he called the, "false prophets of modernism". He was intrigued by the medievalism of Morris & Co., but found their emphasis on rustic, vernacular design to be an affectation. Instead the interiors he executed at Longleat during the 1870s and 1880s reveal a decorative artist steeped in the mainstream of European art and confident in his use of historical styles. As he remarked in *The Art of Colour Decoration*, the decorators of the past, "met the various problems which surface decoration set before them. They are always the same problems; differing perhaps in extent, or in detail, but the same in principle." This remark certainly expressed the view of the great majority of designers working in the 19th century, when historicism played a major role. For example, Crace designed a spectacular series of interiors in the French Renaissance style, including furniture made of ebony and ivory, in the 1890s for William Waldorf Astor in order to celebrate the wealth and prominence recently achieved by his patron.

Nor was the work of the Crace firm confined to country houses and palaces. During the 1870s, when the firm was at its largest with 101 regular employees, the greatest number of sales was for small amounts of textiles and wallpapers, sometimes sent as far as Montreal, Macao, and Australia, to middle-class clients. Civic and institutional commissions had always formed an important aspect of the work of the Crace firm, and this was continued by J.D. Crace, most notably in his highly successful re-decoration of Leeds Town Hall in the 1890s after the original scheme by his father had become blackened by smoke.

For several reasons, J.D. Crace decided to close the family firm in 1899 and act as a consultant from his house at 15

Gloucester Place, London, until his death in 1919. His son was not interested in continuing the business, and many of the principal artists and craftsmen hired by his father had retired without training successors. Moreover, the new century was to prove hostile to the way of life of the Craces' major clients and to the grand manner of decoration they practised. The obscurity of the reputation of the Craces throughout much of the 20th century suggests that the firm would not have flourished alongside the designers of the Modern Movement.

Selected Works

Several hundred signed drawings by members of the Crace family survive in various public collections: the principal holdings are in the Department of Prints and Drawings, Victoria and Albert Museum, and the Drawings Collection, Royal Institute of British Architects (both London); the Department of Drawings, Prints and Photographs, Metropolitan Museum of Art, and the Cooper-Hewitt Museum (both New York); and the Royal Pavilion, Art Gallery and Museums, Brighton. Additional manuscript material, including an unpublished biography of John Crace by his son Frederick and the Mostyn-Crace collection, is in the Victoria and Albert Museum.

Interiors

- 1770-72 Pantheon, Oxford Street, London (decoration: interiors by James Wyatt)
- c.1789-95 Carlton House, London (decorations including the Chinese Drawing Room): Prince Regent, later George IV
- c.1794 12 Lincoln's Inn Fields, London (decoration of the breakfast room): Sir John Soane
- 1801-22 Brighton Pavilion, Sussex (decorations and furniture, including the Entrance Hall, Music Room and Tent Room): Prince Regent, later George IV
- c.1802 Pitzhanger Manor, Ealing (decoration of the back parlour): Sir John Soane
- 1840-44 Chatsworth, Derbyshire (interiors and furnishings, including the library): 6th Duke of Devonshire
- 1840-44 Devonshire House, London (interiors and furnishings; redecorated by J.D. Crace in 1892): 6th Duke of Devonshire
- 1841-42 Taymouth Castle, Perthshire (interiors including the State Drawing Room, Small Drawing Room, Gallery, Library, Grand Hall, Tapestry Rooms and bedroom): 2nd Marquess of Breadalbane
- 1844 Knebworth House, Hertfordshire (interiors and furnishings, including the Library, State Drawing Room and Bedroom): Sir Edward Bulwer-Lytton
- 1846-69 Palace of Westminster, London (decorations and furnishings with A.W.N. Pugin)
- 1849-50 Eastnor Castle, Herefordshire (interiors and furnishings with A.W.N. Pugin, including the Drawing Room): 1st Earl Somers
- 1852-57 Abney Hall, Cheadle, near Manchester (interiors and furnishings including the Drawing Room, Dining Room, Library and Prince Consort's Bedroom): James Watts
- 1854-55 Windsor Castle, Berkshire (State Rooms for Emperor Napoleon III and Empress Eugénie): Queen Victoria
- 1857 Leeds Town Hall (decoration and furnishings; redecorated by J.D. Crace in 1894)
- 1862 International Exhibition, London (decoration and furnishings)
- 1874-82 Longleat, Wiltshire (interiors including the Saloon, State Drawing Room, Ante- Library and Red Library, and State Dining Room): 4th Marquess of Bath

- 1879 Pompeian Room, Ickworth House, Suffolk (decoration): 3rd Marquess of Bristol
 1895–96 18 Carlton House Terrace, London (interiors and furniture): William Waldorf Astor

Crane, Walter 1845–1915

British illustrator, painter and designer

Walter Crane was one of the most influential figures in the British Arts and Crafts Movement, occupying a position of importance second only to that of his friend and mentor, William Morris. And, like Morris's, Crane's talents were as prolific as they were versatile. Trained first as an engraver, he became hugely successful as a graphic artist and illustrator of children's books; he was also active throughout his life as a painter, exhibiting regularly at London's Royal Academy, and he designed several hundred patterns for wallpapers, textiles, stained glass, and ceramics. He was also responsible for the design and execution of painted friezes, mosaics and relief panels within several actual interiors. And finally, he published numerous articles and books championing the unity of the arts and crafts and was a dedicated and able administrator of various art schools and exhibition societies. His work was greatly admired in the UK and he was one of the few British designers in the late 19th century to achieve international renown, particularly in Eastern Europe and the United States.

Born in 1845, the son of the painter Thomas Crane, Crane was educated first on an informal basis by his father, and then apprenticed to the political radical, printer and wood-engraver, W. J. Linton, in 1859. It was Linton who gave him his first experience of book illustration, and in 1865 Crane began designing his own books for children, known as Toy Books, for the publisher George Routledge. Early contact with the work of Morris and his associates, and an awareness of the views propounded in books like C. L. Eastlake's *Hints on Household Taste* (1868), encouraged an interest in the decorative arts and by the end of the 1860s Crane had become thoroughly conversant with current ideas on interior decoration and design. Not surprisingly, therefore, many of his Toy Book illustrations of this period reflect the influence of fashionable, artistic styles, and depict interiors containing features such as Japanese screens and fans, blue and white china, 18th-century furnishings, and oriental rugs that were much admired by followers of the Aesthetic and Queen Anne schools of design.

These illustrations were highly praised by architects and artists and, given their wide circulation, they actively helped to disseminate a taste for new and progressive styles of furnishing in many middle- and upper-middle class homes. They also led to a closer practical involvement in interior design when Crane was approached in 1876 by Metford Warner, the proprietor of the wallpaper manufacturers Jeffrey & Co., with a commission to adapt some of the Toy Book plates as nursery wallpapers. Crane proved to be a skilled and prolific designer of wallpapers of all kinds and Jeffrey & Co. printed more than fifty of his designs. Like Morris, who was clearly a strong influence on his work, Crane frequently made use of interwoven floral patterns. But, unlike Morris, his wallpapers also featured bird and animal forms, such as peacocks, swans, deer and rabbits, and examples such as the *Peacock Garden* (1889), *Cockatoo* (1891), and *Cockatoo and Pomegranate* (1899) patterns, all demonstrate his versatility in incorporating pictorial elements within a floral design. Several of his patterns, like *Woodnotes* (1886), and *Golden Age* (1887) included human figures and were derived from the classical style that he had previously

used in designs for Wedgwood ceramics and for many of his large oil paintings. Others, like the *National Arms of England, Scotland and Ireland* (1902) appear to have been influenced by medieval heraldry. The majority were highly complex, containing numerous colours and much linear activity. As a result they were not only expensive to produce but also sometimes criticised for a lack of reticence that was deemed inappropriate in wallpaper. Nevertheless, they won numerous awards both in England and abroad, and despite the fact that Crane himself decried it as a "decorative disease", his designs were an important influence on the sinuous, vegetal style associated with continental Art Nouveau.

From the late 1870s, Crane designed relief panels and friezes for several actual interiors. Much of this work was executed in plaster and gesso. The work at Coombe Bank, near Sevenoaks, Kent, for example, included an elaborate, classical-style gesso ceiling depicting the signs of the zodiac, for the saloon. This project also included a chimney breast, mantel, andirons and fender, and Crane produced painted decorations for the window shutters and doors, and a frieze of decorative figures that was intended to complement the owner, Dr. William Spottiswoode's, collection of Venetian pictures. In 1880, Crane designed another series of panels based on the zodiac theme that were executed in plaster for the stairwell of Stewart Hodgson's London house in South Audley Street. He also designed four mosaic panels depicting the Elements for the drawing room; an earlier commission in this medium was for a frieze in Lord Leighton's Arab Hall.

Another important project dating from 1880 was Crane's work at 1 Holland Park. Enlarged by Philip Webb, the interiors of this famous house were entirely decorated by Morris & Co. and it contained many of the firm's finest embroideries, textiles and tapestries, as well as a plethora of antiques, paintings and other works of art. Crane's contribution consisted of decorations in the dining room where he devised a lacquered, gesso and plaster ceiling, inspired by the *Rubāiyāt of Omar Khayyām*, and a gesso frieze illustrating scenes from *Aesop's Fables*. In 1883, he painted a three-foot high, oil on canvas, frieze, depicting the early Norse settlers in America, for the dining room of an American house, Vinland, in Newport, Rhode Island. And at Clare Lawn, East Sheen, he designed more painted friezes containing figures representing the arts, entertainment, and learning, for the picture gallery, drawing room and library (1888–90). Crane's last major interior project was for the home of the railway magnate, Sir Weetman Pearson, at Paddockhurst, Sussex (1896–97), where he devised a plaster frieze for the dining room illustrating "a sort of playful symbolic history of locomotion and transport, from the earliest period to the present time", and which included representations of not only ox-carts, boats and automobiles, but also Lady Pearson's silver bicycle!

Crane's versatility as a designer led to his involvement in many media. He designed stained glass, for example, for the windows of the library at Vinland, the picture gallery doors at Clare Lawn, and the Church of Agapemone, Stamford Hill, London. He also designed some spectacular embroidered hangings, sewn by workers at the Royal Art School of Needlework and subsequently exhibited to much acclaim at the Philadelphia Centennial in 1876. His designs for printed cottons were manufactured by Edmund Potter & Co., and

Crane: interior of Crane's house, 13 Holland Street, London, 1890s

Thomas Wardle, his woven textiles were made by John Wilson, and he designed one tapestry, based on his *Goose Girl* illustration, which was commissioned by Morris & Co. and woven at their Merton Abbey works where Crane's stained glass had also been made.

The sheer diversity of his talents makes Crane's style difficult to summarize, but his strength as a designer of two-dimensional works lay in his ability to translate complex visual images into simplified linear designs and to create dynamic patterns out of colour combinations ranging from the subtle to the lively. His three-dimensional reliefs appear to rely more on his admiration for classical or Renaissance prototypes, where balance and clarity of form play a primary role. But perhaps Crane's greatest impact on interior design came through his work for the Arts and Crafts Exhibition Society, his lectures and demonstrations of art and craft techniques, and his publications on the decorative arts and design. In 1888 Crane became a founder-member and president of the Arts and Crafts Exhibition Society, whose aims were to showcase the work of craft-workers and designers, and to inform and educate the public to demand higher standards of craftsmanship and design. Under Crane's leadership, the Society mounted annual exhibitions from 1888 to 1890, and every third year thereafter, and he became a dedicated champion of good quality design. His lecture topics also included practical advice and exercises on topics such as plaster reliefs and embroidery. Much of his writing focused on the unity of the arts and crafts, and, like Morris, he was a firm believer in the creativity of hand-work and in the importance of beauty in improving the lot of society as a whole. These ideas were publicised in books, such as *The Claims of Decorative Art* (1892), *The Bases of Design* (1898), *Line and Form* (1900), and *Ideals in Art* (1905), where they were able to reach a far wider audience than that of his fellow-designers. And finally, as part-time Director of Design at the Manchester School of Art (1893–96), and as Principal of the Royal College of Art (from 1898), Crane also had a significant effect on design education in England.

Biography

Born in Liverpool, 15 August 1845. Apprenticed to the wood-engraver W.J. Linton, London, 1859–62; worked with printer Edmund Evans & Co. from 1863. Married Mary Frances Andrews 1871: one daughter, Beatrice, and two sons, Lancelot, and the architect Lionel Crane. Travelled in Italy 1871–73. Exhibited oil paintings at the Royal Academy, London, from 1862; designed Toy Books for George Routledge & Sons 1865–76; ceramics from 1867; interior decoration, wallpapers, tiles and embroideries from mid-1870s; Art Superintendent of London Decorating Co. 1880; designed printed and woven textiles and from late 1880s. Work exhibited at many national and international exhibitions including the Philadelphia Centennial, 1876. First retrospective exhibition at the Fine Art Society, London, 1891 (toured US and Europe until 1896); exhibited Hungary 1900, Vienna 1901, and Turin 1902. An active member of several artistic and political societies including the Art-Workers' Guild (1884), the Socialist League (1885), the Fabian Society (1886) and the Arts and Crafts Exhibition Society (President 1888–1893 and 1896–1912). Lectured and published extensively on the decorative arts from the 1890s; part-time Director of Design at the Manchester School of Art, 1893–96; Principal of Royal College of Art, London, from 1898. Awarded Albert Gold Medal, Royal Society of Arts, 1905. Died in London, 14 March 1915.

Selected Works

A large collection of Crane's designs for decorative work is in the Victoria and Albert Museum. The Museum also houses collections of his wallpapers, textiles and ceramics. Other important holdings of Crane's work are the Whitworth Art Gallery, Manchester (wallpapers and textiles); the City Art Gallery, Manchester (wallpapers and ceramics); Royal Borough of Kensington and Chelsea Libraries and Arts Service, London (decorative designs); William Morris Gallery, Walthamstow (wallpapers and designs); and the Wedgwood Museum, Stoke-on-Trent (ceramics).

Interiors

- 1875 52 Prince's Gate, London (boudoir: decorative frieze): T. Eustace Smith
- 1877–79 Arab Hall, Leighton House, Holland Park Road, London (Arab Hall: mosaic frieze): Frederic Leighton
- 1878–80 Coombe Bank, Sundridge, Sevenoaks (saloon: gesso and painted decoration): Dr. William Spottiswood
- 1880 1 Holland Park, London (dining room: ceiling, frieze and overmantel): Alecco Ionides
- 1888–90 Clare Lawn, East Sheen, Surrey (picture gallery, library and drawing room: decorative friezes and stained glass): Sir Francis Wigan
- 1890s 13 Holland Street, London (decorations and furniture): Walter Crane
- 1896–97 Paddockhurst, near Crawley, Sussex (drawing room: stucco panels and frieze): Sir Weetman Pearson

Crane designed wallpapers for Jeffrey & Co.; tiles for Maw & Co.; tiles and ceramics for Pilkington's Tile & Pottery Co.; and ceramics for Josiah Wedgwood & Sons. His designs for printed cottons were produced by Edmund Potter & Co., Thomas Wardle & Co., and Birch Gibson; woven textiles by John Wilson & Sons; carpets by Templeton & Co.; tapestries by Morris & Co., and A. H. Lee & Sons. He also designed embroideries for the Royal School of Art Needlework.

Curtains: Bedhangings and Window Curtains

Before the 17th century, documented references to window curtains are rare. The size of windows and the use of wall-hangings and bedhangings to create warmth and comfort moderated their use, and when recorded they are usually described as made of a warm and draught-excluding wool fabric such as the "courteynes of grene saye" used in the three most important interiors in a London house in 1509, or those of yellow saye recorded at Canons Ashby about fifty years later. Darnix curtains "for the windowes" in an important bedchamber were reported in the Hardwick Hall Inventory of 1601 (as were some for Chatsworth). In the same room at Hardwick another set of "curtins of damask and sarscenet for the windowes", and at Cockesden in 1610 for the "wyndoes, 2 curteans of greene cotton" were probably hung to reduce light. The richly decorated and sophisticated interiors of

Renaissance Italy used shutters, wicker and linen screens to exclude light and draughts. By the early 17th century, window curtains were found in the grandest and most fashionable interiors, notably in Italy and France, when the word *rideaux* came into general use. However, they were not generally regarded as necessary fittings until later in the century, and many windows had no curtains until well into the 18th century.

The influence of Italian architecture and style, which had spread throughout Europe by the beginning of the 17th century, not only led to the appearance of larger windows in new classically-inspired buildings, but also promoted the Renaissance ideal of harmony and a unity of decorative effects in interiors. This was created first by architectural ornament and fittings, and enhanced by the textile hangings and upholstery of which Paris had become the leader of fashion by the 1630s. Seat upholstery, bedhangings, wallhangings and portière curtains were often made of the same fabric and trimmings, but window curtains (although they might be of the same colour) were generally fashioned from a different fabric. Soft furnishings in the Princess of Orange's luxurious closet at The Hague were described in a 1632 inventory as being all of green velvet, whereas the window curtains were made of a green silk taffeta. One curtain per window was most common until the later 17th century, although two would be more symmetrical when open. Two windows close together, with the curtain on each drawn to the opposite side, could create the same effect, as many Dutch interiors and a series of engravings of Parisian interiors in the 1630s (Thornton, 1978) illustrate. The 1654 Inventory of Ham House in Surrey describes divided curtains in several rooms with window curtains matching the wallhangings – probably examples of an advanced taste, influenced by the pre-Civil War court fashions of Charles I. When the house was redecorated in the 1670s, divided curtains were fitted in the principal rooms and in 1679 they were also recorded in the elegant interiors of Dublin Castle. In 1673 an article in the *Mercure Galant* (which kept Parisians informed of the latest gossip and changes in fashion) described divided curtains as the latest fashion, although it was most likely that the article was affirming that single curtains were no longer considered to be acceptable (Thornton, 1978).

Inventories of aristocratic and gentry houses in England during the 17th century record references to curtains of "striped stuff", darnix (a coarse patterned woollen material), saye (a lightweight serge), and other woollen stuffs. Indian painted cottons, known as "pintadoes" or "chintes" were being imported by the East India Company and in 1682 the "Calleco Chamber" at Cowdray – including the window curtains – was entirely fitted out with them. In 1623 Lord Howard of Naworth paid 49 shillings for "4 ells of mingled [i.e., shot] taffeta to mak a curtin". Sarsne (a thin silk taffeta) was also popular, being particularly suitable for sun curtains.

Window curtains seem largely to have been fitted to regulate the access of light at this time, hence the use of thin but elegant fabrics. These straight curtains were hung from thin iron rods and rings which were clearly visible. The rods were occasionally gilded and sometimes had a decoratively scrolled or curled end. The curtains were usually sewn directly onto rings or hung from tapes looped over the rod. They were not as wide as modern curtains, so the effect was somewhat thinner and flatter when drawn, and they seem to have hung to

just below the window. By the third quarter of the 17th century, rods were masked by a matching or contrasting textile pelmet, which in a bedchamber, with matching valances on the bed, created more decorative unity. Inward-opening leaded windows were being widely replaced by sliding sashes which were easier to open when curtains were installed, and some embellishments were being added, such as fringe along the bottom and braid to the sides.

Around 1690, the smartest and most fashionable curtains took on a new form as upholstery effects (led by the example of the French court of Louis XIV) became richer, and window curtains followed the pattern of the draped upholstery effects on beds and wallhangings, with flounces, festoons and swagging. These new "pull-up" curtains were drawn straight up or lowered by cords sewn to the back of the curtains, through pulleys set into the embrasure at the top of the window or in a pulley-board. The pelmet to mask this mechanism could be of fabric, or one of wood (known most commonly as a "curtain cornice") was often carved to match other architectural features in a room or the cornice of a bed. These were usually covered with the same fabric of which the curtain was made, and both types could be decoratively edged with a contrasting braid ("lace") or hung with fringe. Designs for four different and elaborate curtains of this type were published by the Huguenot architect Daniel Marot, and were probably inspired by what he had seen in France before he fled as a religious refugee in 1685.

Marot's illustrations for window treatments are very decorative: one has a shaped, scalloped-edged pelmet, the curtain with lappet-shaped edges outlined with braid and fringe. Another has flounced, ruffled edges to the top edge of the pelmet and another is trimmed along the bottom in this manner with additional fringe, and is drawn up so that tails drape at either side and tassels hang in the spaces between the furbelows. These curtain types were being made for English royal palaces by the end of the century: among the 1699 Hampton Court Estimates are details of white silk damask being ordered for the King's Closet, with white silk cord and tassels. Reference is also made to "covering cornices". The pelmet with scalloped edges was used in England until the 1740s, and examples survive in America: wool tape of different widths and colour could be applied to curvilinear pelmets in decorative patterns of scrollwork, strapwork and volutes, reflecting contemporary taste in ornament.

Most of the principal rooms at Dyrham Park, fitted out in the 1690s, had pull-up curtains, with pelmets being specified for two rooms as "Window Curtains" that were "to be made to draw up". These were still made of lighter fabrics and contrasting colours for the rooms, with the richest materials on the walls and beds, such as yellow wallhangings with red and white window curtains or the "painted Sattin Window Curtains & vallains" for the Damask Bed Chamber, where the portière curtains were made of the same damask as the rest of the textile furnishings. Velvet, the most expensive and heaviest fabric, was not generally used for window curtains, but in the best bedchamber, where crimson and yellow velvets were used for bedhangings and portières hung against tapestries, the window curtains were made of yellow damask, generally considered the next best thing. White damask, used also at Ham House, was employed with crimson "strip'd velvet"

Curtains: scheme by Gillow & Co., 1820

upholstery. Silk fabrics were used for the grandest bedchambers, anterooms and closets, as at Ham House, but "Stuff", serge and cheney, and other fine worsted fabrics, were used for "parlours" where dining took place, and libraries, as at Dyrham. Divided curtains with pelmets were also present, such as those of "blew serge" in the Great Hall.

Divided curtains continued to be used in grand interiors, acquiring a new sophistication with the development of a pulley system to draw them. An interior view of c.1730, of a grand reception room at Wanstead House (by William Hogarth, Museum of Art, Philadelphia), which had been built in the 1720s in the Palladian style, has simple draw curtains with the rod on display. In 1705, the French refugee upholsterer Lapierre, who did work at Hampton Court Palace, charged the Duke of Montagu for two sets of window curtains of blue camlet "to draw upon pulley Rodds", and in the following year, for 76 yards of green silk cord with five green tassels to draw curtains. Cords (usually described as "line") and tassels in the 18th century were treated as important decorative accessories for both pull-up and draw curtains. They were made in the same basic material as the curtain, either silk, worsted, linen or of mixed fibres, and usually colour co-ordinated. Rods and other hardware were considered similarly, such as the gilded rods specified for the Dining Room curtains at Temple Newsam in 1735, with a gilded brass pulley, gilded hooks to hold up the rods and "36 large polished brass Rings Gilt".

Against the architectural backdrop of the lavish Baroque style in Europe, and the slightly later, more austere Palladian style in England and America, the most important and lofty

interiors were fitted out with pull-up curtains, where the ornamental woodwork of the window architraves would be exposed when they were drawn up. Increasingly, the fabric of which they were made was colour co-ordinated with the rest of the interior of which they had become an intrinsically decorative facet. The Duke of Cumberland's suite of four rooms at Hampton Court Palace, which were completed in early 1733, had "draw-up window curtains" in two rooms of "blue Florence Taffeta", co-ordinated with blue mohair hangings, seat and bed upholstery. The upholsterer Sarah Gilbert's bill describes the brass rings (or "Os") and the lead weights (or "plumbetts"), usually pear-shaped (although round-shaped weights have been found in surviving festoon curtains supplied by Chippendale to the Tapestry Room at Newby Hall), and three different types of "binding lace", braid, and silk line which were used to make up each curtain. The Chiswick House Inventory of 1770 describes interiors which may have survived from three decades previous, where "festoon Window Curtains" of silk lustering are colour matched in interiors with velvet and tapestry wallhangings.

Curtains of this type were being described as "festoon" window curtains in England by the middle of the 18th century, and were so ubiquitous that in inventories between the 1760s and late 1780s the term was often not specifically used (Westman, 1993). In America they are generally described as "Venetian" curtains. In the Neo-Classical interiors of this period, the fuller, more bunched festoons in use earlier in the century were not considered so desirable, as surviving "festoon" curtains at Osterley Park demonstrate. In the grandest rooms, hung with damasks or brocades (velvet was not so

fashionable), curtains were now being made of the same fabrics and, probably to protect them from the damaging effects of sunlight, were usually lined, often with a glazed tammy (a fine worsted fabric) which was richly coloured to match the facing fabric. Blinds were generally installed with festoon curtains to do the job that curtains had earlier, such as the wooden-slatted Venetian blinds at Audley End House, brown Holland roller blinds at Appuldurcombe Park (c.1780 Inventory) or the "Spring blinds" at Chiswick House (1770 Inventory).

The silk face and tammy lining of the surviving Etruscan Room curtains at Osterley are bound together along the sides and edges with a patterned braid or "lace", concealed by the heading of a silk fringe. On the back of each, four lengths of narrow silk tape are stitched, with small brass rings attached, about 8 to 9 inches apart through which the silk cords ("line") were passed, creating three evenly-spaced swags when drawn. The numbers of these lengths of tape could be varied to create less or more swags, depending on the size of the window and the effect desired. The plumbets were covered with the lining fabric and stitched onto the base of each of the silk tapes on the reverse. Attached by rings to the base of the cords, these weights would influence the shape of the swags when drawn up, making them neater, and allow the curtains to be fully lowered. A large silk tassel was also divided to hang on the end of the silk line, which was looped around a pair of gilt brass cloakpins and which fixed the curtains in position.

The shape and finish of curtain cornices increasingly matched those of beds in the best bedchambers. The Boughton inventory of 1718 describes the State Room window curtains with cornices of white damask with a white fringe. Chippendale's *Director* includes a plate of carved cornices for beds and windows, and the Gallery at Harewood House still displays spectacular examples of the firm's work, with curtain cornices carved and painted to imitate the effect of festooned silk with fringed valances. In the middle decades of the century curtain cornices took on the curvilinear lines of the Rococo and could be ornamented with *rocaille*, or pierced. Gothick interiors provided their own ornamental vocabulary for cornices for window curtains, and those provided for Neo-Classical interiors in a severe and basic box form were ornamented with appropriate classical motifs, enriched perhaps by cresting of scrolled acanthus or anthemion, or, as in one Parisian example of 1773, with military trophies. Occasionally no cornice was supplied, as in the Great Drawing Room and dining room at Audley End, where a braid might be applied along the top of a curtain which would be gathered in small box-pleats and pinned to the pulley board behind.

Formal damasks, generally *en suite* with the rest of the room, were favoured during the early part of the century, but damasks of a more naturalistic floral flavour (sometimes of three colours) were popularised by the Rococo taste. In England such damasks were used at Bocket Park and Audley End in the 1770s. Fabrics used at Osterley for other window curtains include "Decca work", an Indian embroidered cotton used for Mr. and Mrs. Child's bedchamber, which was lined with silk. Thomas Chippendale provided festoon curtains for the drawing room of William Constable's London town house of "Blue mixt damask", lined with blue tammy, with "mixt" line and tassels. Fringe, when used, was often applied only

along the bottom of the curtains, or could be broader across the bottom and narrower along the sides. Alternatively, it could run only part way up the sides. It could also be dyed in narrow widths of different colours, such as the crimson, white and green fringe used to trim the three-colour damask festoons in the Great Drawing Room at Audley End in the 1760s. Lustring (a crisp plain coloured silk) was used widely by the end of the century, as were watered silks and tabberary, a striped fabric with alternating bands of watered and satin weave mixed silk. Worsted fabrics, such as moreen and camlet, which could be plain, striped or stamped with a watered or patterned effect, were also popular, particularly in America. Printed chintzes, increasingly available from the middle of the century with the development of new technology, were widely used on both sides of the Atlantic, particularly in bedchambers, parlours and drawing rooms. In 1770 a "Chintz Bed Chamber" in the old house at Chiswick had "Chintz festoon Window Curtains Lin'd".

Another form of window curtain popular in England and America from the middle to the end of the 18th century was described in England as "drapery" or "in drapery" and in America as "festoon" curtains. These would be hung from a pelmet board but divided, and the rings would be sewn on diagonally behind so that when the cords were drawn the curtains were pulled up towards the outer corners of the window, forming "draped festoons" with tails at the sides. Zoffany's portrait of Sir Lawrence Dundas (c.1769) depicts curtains of this type, made of blue damask with a matching fringe, and Thomas Chippendale's firm made two similar curtains for Merham-le-Hatch in 1767.

After the 1770s upholstery became increasingly important. This was particularly evident in Parisian interiors, where new and elaborate curtain types were created through the inventive cutting and combining of fabrics and colours, enriched with trimmings hung from rods, with a pelmet of "drapery" swathed over a decorative pole or hung in a festooned form with tapering tails, but with draw curtains hung below from rods. The walls of Empire-style rooms were hung all round with these draperies, of which the window curtains formed an intrinsic part. In the 1780s Henry Holland's work at Carlton House for the Prince of Wales demonstrated the richness of these new effects. The most intricate and extravagant of the hanging schemes would have two different weights of fabrics, usually in two colours with the heavier for the drapery, running across the top of the window and decoratively draped over a pole, and the lighter used for the secondary areas which could be festooned swags or a divided pelmet hanging beneath the drapery. Both elements would be richly trimmed.

Divided curtains and "drapery" were the height of fashion throughout Europe and America by c.1800: designs shown by Thomas Sheraton in his *Cabinet Directory* (1803) illustrate the new window drapery with elaborate valances and trimmings, and he noted that festoon curtains were less favoured in "genteel houses" than "the French rod curtains" hanging straight. The rod allowed divided curtains to overlap slightly where they met; two pulleys on one side and one on the other, with cords operating the draw function from one side, created a system that was used well into the 20th century. Draped pelmets, perhaps with sun-curtains or blinds, were also popular; Thomas Jefferson ordered "Drapery for the tops of 4

Curtains: Gothic curtains designed by A.C. Pugin from Ackermann's *The Repository of Arts*, 1826

windows ... no curtains being desired" for Monticello in 1808. Many were related to the newly fashionable floor-length windows, and "continuous drapery", spanning a number of adjacent windows, was popular until 1830; it never totally went out of fashion and was revived again at the end of the 19th century. An early example is the scheme provided for the Dining Room of Attingham Park in 1805 by Gillows. Such draperies needed to be protected from the damaging effects of sunlight, and blinds were standard additions, as were sun-curtains of muslin (plain or figured), taffeta or some other semi-transparent fabrics hung from a thin inner rod, which could be partly drawn to one side. These could be coloured, embroidered, trimmed with fringe or have shaped edges.

Rings and rods increasingly became the focus of fashionable ornament, and the curtain cornice virtually disappeared for some years during the early decades of the 19th century. Some schemes hung from rods, but the tails were draped over large cloak pins stamped with stylised rosettes or other appropriate ornament. Imperial eagles were employed in the grandest

schemes, surmounting the whole arrangement and grasping the edge of a pelmet in their claws. The head of Apollo, from which the folds of the drapery radiated, was used in the Crimson Drawing Room at Carlton House. Decorative rods took the form of a Roman spear or Roman fasces, and after 1814 Prince of Wales feathers were incorporated in the vocabulary of ornament – which also included elaborate finials and terminals shaped in popular classical ornaments of the period such as the anthemion or acroteria, outsize cloakpins and rings, and brackets to support gilt or mahogany and rosewood rods, which became thicker by the 1830s.

Contemporary theories of complementary colours also appear to have influenced the fashioning of upholstery, and particularly curtains, during the first three decades of the 19th century. Many plain fabrics, boldly coloured with contrasting linings and trimmings were draped over rods, with the curtains beneath held back over large-scale cloak pins, and after 1820 by tiebacks consisting of heavy looped cord with large tassels. Bright lemon or egg yolk yellow, scarlet, red and blue were all

popular colours, and could be joined in combinations such as crimson damask with a blue embossed calico. Other recommendations included light blue silk lined with pink taffeta with gold trimmings, yellow with lilac or geranium pink. A more austere combination of scarlet and black was used in the Long Gallery at Castle Howard and the Queen's Breakfast Room at Buckingham House. These colour and textural contrasts could be repeated in the trimmings and tie-backs, which could be made wholly of silk or worsted, or a combination of the two. Red and heavier fabrics tended to be obligatory for dining rooms, while lightweight fabrics were for drawing rooms, boudoirs and bedrooms. The most expensive and exclusive fabrics were still silk velvets, "superfine cloths" (closely woven woollen fabric with a fine nap), silk damasks and satins. Cheaper alternatives were moreen, Manchester (cotton) velvets and chintzes, with a wide range of patterns, from large landscapes to small seaweeds, often used for linings, and including floral, Chinoiserie, classical and Gothic designs. Cotton dimity was another fabric that became increasingly fashionable during the first three decades of the 19th century.

A larger range of trimmings became available, of which gold was the most frequently recommended. Interlacing gimps (used for borders) were made of vellum covered with silk thread in various sizes and degrees of elaboration. Bordered fringes could have richly decorative "hangers" of small balls, or balls interspersed with tapered long drops or spools, and might have a wide netted heading. "Bullion" fringe consisted of lengths of tiny joined balls set before a double spun cord fringe at regular intervals, and tassels were made with similar combinations, in different sizes for hanging from draperies and for use as tiebacks. All trimmings were often in contrasting colours to match those of a curtain scheme.

From the beginning of the 19th century, published manuals and periodicals played an important role in disseminating information about new fashions throughout Europe and America among the burgeoning middle classes. George Smith's *Collection of Designs for Household Furniture and Interior Decoration* of 1808 illustrates the hierarchy of newly fashionable styles. Designs for the Egyptian style were "... proper for Dining-rooms and Libraries"; the Etruscan style was for "secondary rooms, with draperies of plain coloured calicoes or small chintz with fringes of worsted", and the Chinese was for grandeur when "the curtains should be made wholly of silk or velvet and in either case embroidered in yellow to imitate gold". Rudolph Ackermann's *Repository* popularised the mature Empire style of Percier and Fontaine in England, as did the *Workwoman's Guide* (1838) in America. Also following the French lead, J.C. Loudon's *Encyclopaedia* of 1833 promoted the "Grecian" taste in draperies with simple designs of straight hanging panels of heavy material hung from large brass or wooden rings on rods with elaborately turned finials, in a manner that continued in fashion in middle-class houses for three decades. From the 1820s, the historical revival styles which were to dominate interior design for the rest of the century began to appear in increasing numbers of books, trade catalogues and periodicals. The Gothic was a highly creative and reforming strand, while the "Renaissance" or "modern" French style incorporated most outpourings of the classical tradition in drapery, including the revived "Louis Quatorze" and "Louis Quinze" styles. The latter dominated mainstream

fashion in the middle decades of the century and again during the 1890s throughout much of Europe and America.

About 1840, the lambrequin – a flat pelmet of shaped outline, often fanciful and with long tails at the sides – appeared. It could be hung from poles or from decorative cornices and generally replaced draped and festooned headings. One of the most fashionable shapes was known as the "Vandyke" which could be used for all the medieval-inspired and exotic styles, but, as many contemporary French publications illustrate, simply by varying the shape and trimmings, lambrequins could also be made to express the whole gamut of popular styles.

A wide variety of fabrics in many price ranges also became increasingly available, such as mixed damasks, moreens, wool velvets and repps. The best rooms continued to be fitted with silks or wool, with the heavier fabrics still being used in libraries and dining rooms, often in crimson or deep olive green. Seventeenth- and 18th-century silk damask designs in Baroque and Rococo patterns were rewoven using new technology, as were 17th-century fabrics such as brocatelle and chenille and "tapestries" for upholstery. Chintzes began to go out of fashion by the 1860s, except for use in bedrooms.

The layers of different fabric weights, embellished with long, trailing braid, fringe, cord, tassels and tiebacks, attracted the antipathy of mid- and late 19th century design reformers who attacked the unnecessary complexity of contemporary curtain schemes, and the use of heavy fabrics and lavish trimmings as repositories of dust and vermin. C. L. Eastlake praised the new cretonnes (an unglazed printed cotton) in preference to chintz in his influential *Hints on Household Taste* (1868), and recommended a heavy ribbed fabric with broad horizontal stripes which needed no lining or trimmings and which could recreate the simplicity of early curtains. Fabrics of this type were imported from North Africa by firms such as Liberty's of London. They were further promoted by designers like E. W. Godwin and Bruce Talbert who published illustrations during the 1870s of sparsely furnished interiors in a reformed Gothic or Japanese-inspired taste with curtains hanging in two lengths to the floor from simple brass rings and rods without blinds or sun-curtains. Eastlake and other writers in England and America also recommended that curtains should be sewn onto rings, without pleating. And for the first time in almost two hundred years, the emphasis on decorative unity within interiors was replaced by a self-conscious eclecticism in fashion, where window curtains could be of a different fabric from other soft furnishings in a room, or different in colour or pattern.

The late 1880s saw a mainstream revival of traditional drapery styles which used more fabric and became more complex in their cutting and arrangement. In the trade these hangings, whose use extended to the covering of doors and mantlepieces, were generically known as "French drapery". The reaction followed in the 1890s, led in England by architects working in the Baroque revival style, and in America by Edith Wharton and the architect Ogden Codman whose book, *The Decoration of Houses* (1897) suggested treating windows as part of an interior's architectural fittings rather than obscuring them with draperies. Interior fashions inspired by the Baroque period and what became known in America as the Beaux-Arts style led to an aristocratic vogue for expensive

Curtains / Bedhangings: French canopied bed set in an alcove, design by Marsaux, Paris, 19th century

reproductions of antique textiles, particularly French *toiles*, brocades and fabrics woven with silver and gold threads which were used for simpler window curtains. Popular colours during this decade were red and old rose.

The 20th century has been marked by rapid changes in technology and fashion, with patterns of taste changing at an ever faster rate, decade by decade. At the beginning of the century there was widespread interest in aspects of the Neo-Classical style, with the Adam, Colonial, Empire and Louis XVI styles being generically interpreted. Textiles often favoured pastel colours, especially green, blue and pink, and were combined with white walls and stripped woodwork. Window-curtains generally hung straight, with simple valances and some sort of undercurtain. The American decorator, Elsie de Wolfe, popularised many of Wharton and Codman's ideas in her book, *The House in Good Taste* (1913), and emphasised a kind of elegant simplicity, including harmonious colours and good proportion, which was based on a liking for the classical styles of the 18th and early 19th centuries.

Within these interiors curtains hung to either the sill or the floor, with simple scalloped valances or none at all. Their form changed little until the 1980s, but the type and design of fabrics reflected changing fashions. Arts and Crafts-influenced

rooms favoured Morris patterns or rough linens and muslins; new, Art Nouveau-style designs were followed by a taste for 17th-century patterns which was particularly strong from the 1920s. Old English Tudor and Jacobean designs made in machine-woven tapestries, or printed on cretonnes and heavy linen, were very popular, as was reproduction crewel embroidery. Modernist, Art Deco designs were often not markedly different from more traditional examples, except that the motifs were generally more stylised and geometric. Horizontal stripes and chequer patterns were quite popular in 1930s flats and middle-class houses, and by the postwar period trimmings had virtually disappeared. Traditional methods of block and cylinder printing were replaced by screen printing, with older designs being rescaled to suit the size of modern interiors.

One of the most significant developments of the past twenty years has been the growing interest in historic styles of upholstery, curtaining and decoration. Emerging in the wake of the English Country House style, pioneered by decorators such as Sybil Colefax and John Fowler, fashionable lifestyle magazines like the *World of Interiors* have plundered the taste of the 18th and 19th centuries to recreate elaborate window treatments including patterns re-woven from old documents and period features such as rich trimmings, festoons and scalloped

draperies. These, together with the chintzy, cottage styles popularised by firms like Laura Ashley in the 1970s and 1980s, have become increasingly popular, and today an enormous variety of pleated, gathered, festooned and draped styles are available to the fashion-conscious consumer.

Cuvilliés, François 1695–1768

Belgian architect and designer

The architect and designer of interiors and furnishings François Cuvilliés was one of the principal practitioners of the French Régence and Rococo styles in Bavaria. To these styles he added his own sense of fantasy and his knowledge of indigenous south German preferences in architecture. His decorations in the Amalienburg Pavilion and in the Munich Residenz represent some of the most breathtaking and splendid examples of Rococo interiors to survive today.

Cuvilliés's exposure to French styles came through his contact with the Parisian designer Germain Boffrand and the Munich architect Josef Effner while he was employed as court dwarf in the service of the Francophile Elector Max Emanuel of Bavaria who was then living in exile in Bouchefort. Cuvilliés's skill as a draughtsman came to the attention of the Elector and by 1715, when Max Emanuel returned to Munich, Cuvilliés was employed full-time in that capacity by Effner. From 1720 to 1724, under the Elector's auspices, Cuvilliés trained with the architect Nicolas-François Blondel in Paris. His career as an independent architect flourished in Munich from the mid-1720s until his death. Much of his best work was for the Wittelsbach court; he was appointed chief court architect towards the end of his life.

One of Cuvilliés's first major commissions was at the Augustusburg Summer Palace, Brühl, where he worked on several projects for the Elector Clemens Augustus, prince-archbishop of Cologne. These projects included the Elector's Chinoiserie-style *Indianisches Kabinett* and the little hunting lodge of Falkenlust at Brühl. But the most magnificent of his designs was a suite of rooms, known as the Yellow Apartment (1728–30), whose principal rooms were arranged on the *enfilade* system and included a dining room, an audience room, a bedroom and a music cabinet.

The dining room was a long rectilinear space overlooking the garden and, like the other rooms in the apartment, carried ivory *boiseries* delicately carved and gilded with decorations relating to the theme of dining. Ceres, goddess of the earth, and Bacchus, god of wine, appear on cartouches while grape vines and wine carafes intermingle with floral motifs. Two corners of the dining room are bevelled and carry large niches of salmon-coloured marble holding basin fountains, adorned with gilt putti and swans, for the cooling of wine. The only other colours added to the room are from painted overdoors fitted into gilt frames and from the soft brown tones of the parquet floor. There is gilt stucco on the cove of the ivory ceiling, and a Venetian chandelier illuminates the room.

The elegant dining room at Brühl is subdued and the *boiseries* do not include the sinuously curving tops so typical of French Rococo examples. The palette is also quite narrow – limited to ivory and gold – and Cuvilliés restrains the witty decorative detailing to specific sections of the room.

The ivory and gilt *boiseries* in the bedroom at Brühl are

Cuvilliés: Hall of Mirrors, Amalienburg Pavilion, Nymphenburg, 1734-39

more exuberantly carved. A French-style sleeping alcove, with a mirrored back wall and enclosed by yellow satin draperies, is the dominant feature of the room. Two bevelled and mirrored wall segments flank the alcove. A marble fireplace with a mantle for the display of *objets d'art* is placed below one of the mirrors. The carved and gilt panelled doors have delicate moulded surrounds in the fashion of the day. Two small ancillary rooms, a dressing room and a *garde-robe*, complete the ensemble.

Cuvilliés's most famous work, and a gem of Bavarian Rococo, is the splendid Amalienburg garden pavilion in the park of the Nymphenburg Palace, Munich (1734–39). Cuvilliés was joined in the creation of the Amalienburg by the master Bavarian artists the stuccoist, Johann Baptist Zimmermann, and Joachim Dietrich, carver of *boiseries* and furniture maker. Built for the Elector Karl Albrecht and his wife Amalie, it was intended as a retreat especially for the Electress and court ladies, who hunted game with bow and arrows from a circular space on the pavilion's roof that is surrounded by a fine decorative iron railing. The elegant sculpted entry overdoor shows Diana, goddess of the hunt, and "hunting" and the bounty of nature provide the thematic imagery of the pavilion.

The single-storeyed Amalienburg pavilion is constructed of brick stuccoed and painted white. The exterior surfaces are drafted and dominated by large windows and slender Ionic pilasters. Inside, the plan has a central circular Mirrored Salon which cuts entirely through the structure with a door to the garden on either side. Two other major rooms, arranged again on the *enfilade* plan, lie to either side of the Mirrored Salon – the retiring rooms of the Elector and Electress with adjacent cabinet. Service rooms at the back include a splendid warming kitchen covered with Delft tiles.

The Mirrored Salon is pale blue in colour and is encased in silvered *boiseries* and arched mirrors in sinuous Rococo frames that are surmounted by a wide band of silvered stucco that encircles the room. From this hang elaborate garlands which festoon the mirrors, and Rococo patterning consisting of cartouches and diamonds vies with lively still-lives of the hunt and the abundance of nature. The decorative band is surmounted by a smaller, simpler stuccoed cove whose ground is painted ivory, like the ceiling. Perched on its top ledge are four handsome semi-nude female figures (Diana, Ceres and companions) who dangle a leg over the side and lean upon a tree that sways into the vault where silvered birds in flight are seen. Romping putti, elegant fountains, pheasants and other game complete this uppermost figural level of the decoration and a Venetian chandelier in a stucco medallion at the ceiling's centre rounds off the decoration of the room as a whole.

The jewel-like interiors of the Amalienburg shimmer with light from the silvered decoration reflected in the multiple mirrors by day and by night. It is a paradisaical image, much like that of the *fêtes galantes* of Antoine Watteau or the Baroque garden in which it sits. Cuvilliés's architectural conception, along with the crisp stucco work of Zimmermann and the carved *boiseries* of Dietrich give a lightness to the interiors. The images are grounded in nature and stem from traditional Bavarian folk art as well as from the Rococo style of French masters such as Germain Boffrand and Juste-Aurèle Meissonnier.

Cuvilliés created several magnificent interiors for the Wittelsbach court Residenz in Munich, beginning with the decoration of the Reiche Zimmer carried out from 1729. His most celebrated commission, the Residenz theatre, where he was assisted by Dietrich, Zimmermann, and the sculptor J.B. Straub, is the quintessential court theatre of the period. Horseshoe in plan, it contains loggia on four levels and a magnificent royal box, decorated with carved and gilded palm trees opposite the stage. Term figures, palms, rocaille motives, and stuccoed draperies in vivid red decorate the loggia which also held sconces for hundreds of candles.

Cuvilliés's fertile imagination received a warm reception in Bavaria and his knowledge of the current French style, together with his adaptability to local sensibilities, allowed him to create a series of unsurpassed masterworks in architecture and interior design. His work reached a wider audience through an influential series of books of ornamental engravings. The first series, published in Munich from 1738, comprised thirty suites of six plates and included cartouches, frames, designs for ceilings and wall elevations with panelling and furniture. From 1745, a second series included more cartouches, panels of ornament, furniture designs, vases, mirrors, chandeliers, picture frames and much else. The impact of these engravings was felt throughout Central Europe and they influenced not only the design of architectural features but also that of furniture and porcelain. Like his interiors, Cuvilliés's engravings show him to have had complete and inspired mastery of the Rococo style and his work compares favourably with the most celebrated of contemporary French designers.

Biography

Born in Soignies-en-Hainaut, near Brussels, Belgium, 1695. Son was the architect François-Joseph-Ludwig Cuvilliés (1731–77). Entered the service of Max II Emanuel (elector of Bavaria 1679–1726) as court dwarf, Brussels, 1706; moved to Munich and worked for Max II Emanuel as a military engineer, 1716; studied architecture in Paris, 1720–24, partly with Nicolas-François Blondel (1683–1756); appointed court architect, Munich, 1725, alongside current court architect Josef Effner (1687–1745); served as supervising architect to electoral court, Munich, 1730–53; appointed director of architecture to Elector Maximilian III Joseph, 1763. Also active as an independent architect from the mid-1720s working in Bonn (1728), Mergentheim (1734), and Kassel (1749); revisited Paris, 1754–55. Published *Liures de Cartouches*, an influential series of designs for ceilings, wall elevations and furniture, Munich, 1738. Died in 1768.

Cuypers, P.J.H. 1827–1921

Dutch architect, city planner, designer and restoration expert

Dubbed "the Dutch Viollet-le-Duc" because he followed the rationalist principles and proportional systems, based on an analysis of Gothic structures, formulated by the French architect and theorist who befriended him, P.J.H. Cuypers might as appropriately be called the "Dutch Pugin", to whose writings

he was introduced by the Roman Catholic intellectual (and his future brother-in-law), J.A. Alberdingk Thijm (1820–89). Like Pugin, both men dreamed of a pre-Reformation Utopia based on morality, truth, and beauty where architecture as the mother of the arts would reveal the divine order. Cuypers believed fervently in the ideal of the *Gesamtkunstwerk* and took it as his responsibility to be concerned with every aspect of design, from the most modest piece of furniture to the most grandiose conception of the building. In each detail, no less than in the plan and structure, the architect, inspired by his faith, would express the sacred nature of his vocation.

In 1862 Cuypers visited London to examine the work of Pugin and G.G. Scott and became a member of the Ecclesiological Society. His architecture has affinities with the work of William Butterfield and G.E. Street, while his decorative designs might be compared not only to those of Pugin but also of William Morris, and he readily accepted Ruskin's advocacy of a wealth of ornament derived from stylized natural forms. Furthermore, Cuypers shared with his British colleagues a fervent admiration for indigenous medieval architecture and an abiding commitment to reviving the decayed crafts of his native land. The foremost restorer of historical buildings in the Netherlands, he lavished particular care on the interiors which, although totally sympathetic to the period in which the original work was executed, nevertheless reveal his own characteristic genius for architectural decoration.

Cuypers was trained at the Academy of Fine Arts in Antwerp (1846–49) where he studied painting and sculpture as well as architecture, a decision that would stand him in good stead in his future evocations of the ideal of the "total work of art." Although that training was chiefly based on the classical tradition, the independent Cuypers was prescient in his early preference for Gothic structures and techniques. And he echoed Pugin in his argument that medieval architecture rather than the current French classicism was the only appropriate model for the Netherlands on the basis of custom, climate, and materials. His obvious talent secured for Cuypers the Academy's Prix d'Excellence, despite the fact that he submitted a neo-Gothic church design. After receiving his diploma, he made a trip to study and measure medieval buildings on the Rhine.

In 1850 Cuypers commenced practice in his native Roermond in the southern Netherlands, where the population was predominantly Catholic; when the Dutch government restored the episcopal hierarchy in 1853, his career as a builder of ecclesiastical structures was launched. (He designed more than 300 churches, often accompanied by rectories; unfortunately, many of them have been demolished with the decline of religious worship.) That same year he established, with F. Stoltzenberg, a group of ateliers for the creation and production of "Christian art" (*Christelijke kunst*) that would furnish in complementary medieval style the religious buildings that he was asked to design, for – again like Pugin – he found the fittings and decorative items then available to be inappropriate. Modelled after the masons' lodges and guilds of the Middle Ages, his workshops would eventually employ more than eighty designers and craftspersons to execute, variously, windows, altars, pulpits, confessionals, pews, vestments, chalices, stations of the cross, chasubles, lamps, and wall decorations in diverse materials like wood, stone, plaster, wrought

iron, precious metals, tile, mosaic, terracotta, paint and stained glass. From Roermond these products found a ready market abroad, for they were displayed at international exhibitions – often receiving recognition in the form of medals. Further, Cuypers's example stimulated the founding of about a dozen other ateliers for applied arts in his native city.

When Cuypers moved to Amsterdam in 1865, he continued to use his own workshops, situated adjacent to his former house and studio, to embellish and complete his new constructions and his numerous restorations throughout the Netherlands and in Germany. During the 1870s and 1880s, he was particularly active in the area of furniture making, preparing interiors for government buildings in The Hague, for the Rijksmuseum, and for various private residences, and he established a branch of Cuypers & Stoltzenberg in Amsterdam. In 1894 he returned to Roermond and started a new firm, Cuypers & Co., with his son Joseph, also an architect-designer.

Almost single-handedly, Cuypers regenerated, or perhaps more correctly, transformed, the brickmaking industry; this was necessary because the use of unplastered, high-quality brick, once the primary building material of the Netherlands, had declined under the influence of Beaux-Arts architecture, as had the knowledge of bricklaying. Cuypers encouraged the manufacture of bricks of different formats and shapes, and of diverse hues like green, purple, and yellow as well as the time-honored red, and he trained masons to fashion complex ribbed vaults in brick, enlivening interiors through polychromy and distinctive profiles. The Church of the Sacred Heart (Vondelkerk) in Amsterdam (1870–73), is an example of one of the most dazzling of the surviving sanctuaries.

Influenced by Alberdingk Thijm, whose numerous writings urged the recovery of the symbolic dimension of architecture, Cuypers developed ornament that expressed theological and historical meanings; he would extend this concept of *architecture parlante* to secular work as well. The Rijksmuseum, a commission won in competition in 1876, was the first 19th-century building in the Netherlands to have a decorative program so carefully and thoroughly conceived from the iconographical standpoint, to the extent that it rivals in complexity of imagery and variety of material the major public buildings of London, Paris, Munich, and Berlin. He was aided in the formulation of the program by the Hon. Victor de Stuers (1843–1916), chief of the Arts Section in the Interior Ministry from 1875 to 1901, a Roman Catholic, and a strong supporter of Cuypers's innovations. The exterior is resplendent with relief carvings, tile murals, and stone and metal – iron, zinc, copper, bronze – sculptures and details that glorify the history and art history of the Netherlands and celebrate both famous and anonymous practitioners of the fine and useful arts; the stone portraits of Cuypers and de Stuers imitate those that often decorate medieval churches. The façades thus offer hours of visual pleasure and instruction.

Within, the visitor encounters not only the collections of paintings, sculpture, furniture, ceramics, textiles, armor, dolls' houses, and the like, but a rich tapestry of polychromatic patterns that sympathetically evoke the historical context of the works on display. Mosaics on the floor symbolize the material world, the middle zone of the wall represents the social world, and the upper walls and vaults the intellectual world; much of the painted decoration is the work of Georg Sturm.

The stenciled friezes and vault paintings have affinities with those created by English Arts and Crafts designers as well as those by Viollet-le-Duc, and in some cases cover the iron beams that Cuypers incorporated into his structure. Regrettably, much of the decoration was whitewashed at a later time, but since the 1980s portions of the original colors and motifs have been restored. The enormous stained-glass windows, however, continue to glow in the antechamber with rich harmonies of colored light; after a competition, the London glazier W.F. Dixon won the commission to depict a program devised by Cuypers. The three large windows depict Painting, Architecture and Sculpture, the smaller ones Poetry and Music, and Wisdom and Theology.

Like the Victoria and Albert Museum, the Rijksmuseum embodied as well as exhibited examples of applied art, and served as a training ground for designers and craftsmen no less than a repository for objects which they might emulate. In 1877 Cuypers had set up in the building shed of the museum a workshop where draughtsmen and sculptors were taught to conceive and execute symbolic decoration; in 1879 this became the official school of applied arts "Quellinus," and moved to quarters in Cuypers's former house on the Vondelstraat; in 1883 the school settled into a new building, also designed by Cuypers. In 1881 two additional places of instruction were established for the Rijksmuseum – the State School for Drawing Instructors and the State School for Applied Art. Cuypers had argued that the lack of skilled practitioners in the northern Netherlands, which required the importation of decorative artists and craftsmen from Belgium, England, and Germany to complete some of the museum's decoration, was an obstacle to the development of an architecture worthy of his native land, and he did his best to ensure training to overcome the deficit.

The extensive decorative program of the vast Central Station, 1882–86, was accomplished by pupils from these schools as well: references to travel and allusions to the cities and countries served by the Dutch railways abound on its external surfaces, while the various waiting rooms within, including one exclusively for the use of the Royal Family, beguile the waiting passengers with a visual feast of imagery, color, and texture; the complex and somewhat moralizing allegories were devised by Alberdingk Thijm. The structural, formal and decorative vocabulary of both the Rijksmuseum and the Central Station is an eclectic mixture of Neo-Gothic overlaid by Northern Renaissance, filtered through the decorative inventions of English Gothic Revivalists and of Viollet-le-Duc. Calvinists and liberals who experienced these public buildings would have found a single-minded reference to medieval architecture too "Papist", so Cuypers, like his contemporaries in other countries, invented a national style that combined profane and religious elements from the 13th through the 16th centuries.

Château De Haar, at Haarzuylens in the province of Utrecht (1892–1912) comprises one of Cuypers's most triumphant ensembles. Nominally a restoration, this, the largest castle in the Netherlands, is actually a new and very personal creation, especially as regards the interiors. The 15th-century building was in ruins when in 1892 Cuypers was invited to rebuild it. There was nothing left of the original decor nor were there documents on which to base his designs; the result, which took

fifteen years to execute, is a magnificent series of imaginative and elegant spaces lovingly and lavishly detailed to suggest his own vision of the Middle Ages.

Cuypers also participated in determining the layout of some of the extensions that were developed after the fortification walls of the city were demolished in mid-century. In particular the Vondelstraat, which many of his colorful house façades still front, and the sites on which the Rijksmuseum and the Central Station are located, demonstrate his skills applied to town planning. A member of the city council during his last years in Amsterdam, he was appointed to the commission for public works, where he could apply his expertise.

Cuypers also represented the council on the committee for secondary education; as demonstrated above, instruction of artists and artisans was a high priority. Many designers and craftsmen who gained fame during the late 19th and early 20th centuries emerged from Cuypers's office or from the schools he was responsible for founding. J. L. M. Lauweriks and K. P. C. de Bazel worked for him until 1895, when they renounced Catholicism for Theosophy and established their own Atelier for Architecture and the Applied and Decorative Arts, and such renowned decorative artists as L. Zijl, G. W. Dijsselhof, C. A. Lion Cachet, and Theodoor Nieuwenhuis attended the Rijksmuseum Schools where Cuypers taught the history of art as well as essentials of design. In the reinvigoration of the crafts and applied arts in the Netherlands, Cuypers was indisputably the most important figure of his generation, and his influence in that arena was profound and long-lasting.

HELEN SEARING

Biography

Petrus (Pierre) Josephus Hubertus Cuypers (Cuijpers). Born in Roermond, Netherlands, 16 May 1827. Educated at the Belgian Academy of Fine Arts, Antwerp, 1846–49; won Prix d'Excellence, 1849. Married Antoinette Alberdingk Thijm; son was the architect Joseph Cuypers. Established architectural office, Roermond, 1850. Active in the restoration of historic buildings in the Netherlands and other countries, especially Germany, throughout his career. Founded firm for the design and production of church furniture and liturgical fittings with F. Stoltzenberg, 1853. Moved his practice to Amsterdam, 1865; founded Rijksmuseum School (later Quellinus School), 1865; set up additional schools to train draughtsmen, sculptors, decorative artists and craftspersons, 1879 and 1881. Elected to Amsterdam Council. Exhibited furniture at the Art Applied to Industry Exhibition, Amsterdam, 1877, and at many international exhibitions abroad. Returned to Roermond, 1894. Died in Roermond, 3 March 1921.

Selected Works

An important collection of furniture, painting, sculpture, drawings and other documents related to Cuypers's career is in the Roermond Museum, situated in his former house and atelier.

Czech Cubism

Theo van Doesburg writing in the Modernist architectural journal, *Het Bouwbedrijf*, in the mid 1920s was a keen though critical advocate of Czechoslovak experiments in architecture and design. He saw the contemporary development of Functionalism there as "trailblazing" whereas Czech Cubism, developed by architects and designers fifteen years earlier, was written off as a form of mere decorativism, as a "simple replacement" of Secessionism and as a misguided departure into "aestheticism" and "individualism." For the greater part of this century van Doesburg's views held sway: Czech Cubism was first eclipsed by the Modern Movement and then shrouded by the aesthetic dictates of Stalinist and post-Stalinist culture in Czechoslovakia. But with the rise of interest in Czech culture abroad since the "Velvet Revolution" of 1989 and post-modern fascination with semantics and decoration, Czech Cubism has enjoyed a thorough reassessment and rehabilitation.

The first signs of Cubist architecture and design in Bohemia were found around 1910. It developed, perhaps paradoxically, as both a product of Czech bourgeois affluence and as an avant-garde (and sometimes nationalist) rejection of the Viennese Secessionist principles formulated by architects such as Otto Wagner who affirmed "purpose, construction and poetry." Josef Chochol and Pavel Janák, both architects, formulated spiritualist philosophies of design and a dynamic ideal of planar form derived, in part, from Cubist art. Initially, Czech Cubism took form on the pages of the artistic journals published in Prague. But from 1912 these ideas began to be translated into actual designs by a group of architects and designers working and exhibiting with an alliance of artists, the Group of Plastic Artists, which formed in that year. Early

significant designs included Janák's reconstruction of a house (the Fára House) in Pelhřimov of 1913. This design, a richly plastic façade of sculpted planes cloaking a conventional apartment house, is typical of the initial years of Cubist architecture in Bohemia.

At this time a number of architects also began producing designs for furniture. Janák, Josef Gocár and Otakar Novotný's furniture reflect their interest in oblique planes, prisms and triangular forms. In most designs this fascination prevailed over concerns for material or technique. The heavy sculptural forms of these wooden, upholstered chairs and glass and wood cabinets demanded ingenuity on the part of the cabinet-makers employed to realise the designs. So while having apparently "modern" origins in Cubism, these chairs and other pieces of furniture were, in such terms, conservative. In effect Czech Cubism's radical aspect lay in the intellectual declarations and the visionary sketches made by its leading advocates. Janák, in particular, rejected utilitarian and quotidian concerns for spiritual expression in his poetic declarations published in the Czech artistic press before World War I. These designs for furniture before 1918 were largely commissioned by patrons of the artistic avant-garde in Prague: figures like Vojta Novák, a theatre director, and Václav Vilém Stech, an art critic. But Czech Cubism did find popular form through Artel, a progressive decorative arts workshop established in Prague in 1908. The ceramic, glass and metal-ware designed by Artel members took a variety of forms including traditional folk arts (echoing growing Czech nationalist sentiment at the time) and the radical Modernism of Cubist designs. Vlastislav Hofman, for example, sought to realise a decorative Cubism by deforming traditional ceramic forms in a series of services and vases. The surfaces of these Artel products were transformed with angled planes and trimmed edges.

In 1914 Czech Cubism underwent a shift that has been described as a move to "monumentalism" and "decorativism." The angular, planar forms exploited in pre-war designs by Gocár and Janák evolved into circles and curves. This style, known as "Rondo-Cubism," was adopted as a national style in 1918 when the new Czechoslovak state emerged and its practitioners became prominent figures in the architectural profession. Cubism had since its arrival in Bohemia been characterised as part of the national heritage, a modernisation of the dynamism of the Baroque. But the new national style, often including elements of vernacular architectural forms, was a form of popularism designed to meet the national mood. The dynamism which had characterised pre-war Czech Cubism was replaced by weighty geometric forms and an emphatic use of colour (often in the new national colours, red, white and blue). The Legionnaires' Bank in Prague designed by Gocár in 1922, an example of "official" patronage of this style, has an oppressive, classical symmetry with massive circular decorative forms bolted onto its façade and an overbearing decorative interior scheme. Rondo-Cubism marked the last phase in the development of Czech Cubism. Lasting little more than a decade the entire movement was short-lived. But a number of influential architects after 1918 began their careers under its influence: Chochol was an active proponent of Functionalism in Bohemia in the 1920s; and, in the case of Jirí Kroha, his early experiments in the Czech Cubist idiom formed a foundation for successful practice in Stalinist Czechoslovakia. His

designs for Brno University Library of the early 1950s, for example, reflect roots in Cubism.

The number of new buildings built in the early pre-1918 phase of Czech Cubism was small. And the Cubist aspect of these buildings was often a matter of modelling the façade while the organisation of interior space often conformed to convention. The façade itself was the focus of theoretical discussion among these architects and designers. In 1912 Janák wrote an essay entitled "Renewal of the Façade" published in *Umelecký měsíčník* (*Arts Monthly*) in which he celebrated the plastic and dynamic handling of form on the front of a building as the "movement of matter." The organisation of space according to Cubist "principles" was to some degree an unresolved intellectual challenge. Pablo Picasso and Georges Braque's painterly mission to "unfold" the subjects of their paintings in time and space was essentially at odds with architecture which by definition requires the fixing and framing of space. Simply to regard the façade of a building, as Janák claimed in his 1912 essay, as a large picture plane failed to acknowledge the Cubist challenge to space and volume. This problematic relationship with Cubism seems even more pronounced when considering the later "Rondo-Cubist" style. This aesthetic, forged on circles, rings and cylinders – the geometry of perfection and wholeness – seems in conflict with the fragmented, splintered and even "kinetic" aesthetic of Cubism in painting.

To some extent, therefore, the designation "Cubist" was a misnomer. For while it is undeniable that analytical and synthetic Cubism developed in France was a major influence on the work of key figures in Prague like Janák (who saw paintings by Picasso and Braque acquired by the Czech collector, Vincenc Kramár, in 1911), a broad range of other influences and shared enthusiasms can also be traced. Before 1918 Czech Cubism seems to have been a hybrid conglomeration of different themes and concerns. Futurist enthusiasms for simultaneity, modernity and velocity as well as for the Gothic for its particular synthesis of technology and fantasy (notable in the "diamond" vaults found in late Gothic churches of Southern Bohemia and Moravia), were strongly expressed by Chochol in his 1913 essay "On the Function of the Architectural Detail." A further, and probably more significant point of intellectual congress was with German Expressionist architects. The Deutscher Werkbund Exhibition in Cologne in 1914 holds a significant place in the history of Expressionist design largely due to Bruno Taut's Glass Pavilion. Four rooms in the Austrian pavilion dedicated to Bohemian art and industry were designed in a Cubist style by Novotný. He was warmly applauded by contemporary German supporters of Expressionism for bringing a slavic "energy" that might "speed up the pulse" of German design. Similarly the celebration of the crystalline structure of the prism and the pyramid in Janák's writings echoed the Expressionist poems of Paul Scheerbart and the drawings of crystalline buildings by Wenzel Hablik (a Bohemian graduate of the Prague Academy of Arts) in Germany. In fact, the contemporary critic, Václav Vilém Stech preferred, with some reservations, the moniker "Czech Expressionism" as the appropriate description of this new style of design in Bohemia. Perhaps Stech was right: Janák and his colleagues' essays published at the moment of the appearance of Cubism in Bohemia are a strong call for individual creativ-

ity and free expression in design above all technical and utilitarian considerations; in other words, an appeal to the “inner” man characteristic of Expressionism in Europe.

Despite the attention to the façade and the relatively conservative planning of space (and consequently the social vision of these architects), furniture designs best display the more experimental and dramatic achievements of Czech Cubism. The designers abandoned contemporary Secessionist fashion of the interior as *Gesamtkunstwerk*. In fact, many contemporary photographs of interiors arranged by Gocár, Novotný and Janák show their striking pieces in rather conventional arrangements accompanied by rather banal bourgeois furnishings such as vernacular ceramics and floral patterned carpets. More importantly, the individual object – be it a chair, a table or a lamp – was claimed to be a work of art in its own right. The Czech Cubists viewed their furniture designs as expressions their own aesthetic vision. In the early phases of Czech Cubism these angular, sculptural pieces of furniture lacked any applied ornament and, consequently, had a rather monumental and even sometimes primitive appearance. Ornamental effects were replaced by the sculptural quality of the object itself. Its forms were essentially abstract, making no reference to historical ornamental languages or to nature. Nor were these objects in keeping with the prevailing principles of good design established by influential theorists such as Gottfried Semper who stressed that form should be derived from materials or technological process. For instance, craftsmen constructing Gocár's designs for a table shown at the first exhibition of the Group of Plastic Artists, had to make bevelled, hollow forms that mimicked the seemingly “cast” and inevitably heavy shapes suggested by the architect's drawings. In fact, the drawings and other representations of Czech Cubist furniture were often better expositions of their attitudes to art and design than the resulting pieces. Fluid, expressive sketches or photographic images capturing the object from unexpected angles seemed to suggest deformation and spatial instability whereas the actual realised object was often disappointing, its presence static and monumental.

Czech Cubist designs testify to the sense of complexity and confusion experienced by a generation of architects and designers in the 1910s in their search for the modern. As Milena Lamarová has argued, “Cubism was recognised not as a style or a dogma, but as the point of departure for the modern perception of the world.” Although the designs and writings of Janák, Gocár and Chochol were strongly marked by a sense of departure from the past and, in particular, from historicism and naturalism, they manifested a sense of uncertainty about where the future would lie. And as van Doesburg's views indicate, Czech Cubism was eclipsed by the Modern

Movement in the 1920s. In one sense, however, the Czech Cubists anticipated a Postmodernist approach developed by figures like Ettore Sottsass of the Memphis group in the 1980s, which regards furniture as discursive, contemplative objects rather than as practical and functional things.

DAVID CROWLEY

Selected Collections

A large collection of “Cubist” furniture, including examples by Josef Chochel, Josef Gočár, Vlastislav Hofman, Pavel Janák, Jirí Kroha, Otakar Novotný and Rudolph Stockar, is in the Museum of Decorative Arts, Prague. Furniture and designs by Antonín Procházka are in the Moravia Gallery, Brno. The National Technical Museum, Prague, holds a substantial collection of architectural drawings and designs by members of this group; archive photos including views of contemporary interiors and exhibitions are in the Stenc Collection, National Institute for the Protection of Heritage and the Environment, Prague.

D

Dairies

Traditionally dairies have been part of farm architecture. A special room was set aside for the storage of milk and the production of cream, butter, and cheese. Large manor houses and stately homes ran their own dairies to supply the needs of the house. This was the state of affairs until the middle of the 19th century when dairy factories began to emerge to supply the ever-growing towns.

The need for dairies to have clean interiors has made tiles an integral part of dairy architecture. Delftware tiles made in Holland and Britain were used in dairies to provide more hygienic wall surfaces. Tiled dairies emerged during the course of the 17th century, such as Queen Mary's dairy at Hampton Court which was completed in 1689 with large blue-and-white tiles made in Delft. At the time Daniel Defoe recorded that "the Queen has also a Dairy, with all its conveniences, in which her Majesty took great delight", and the watercolourist Mary Ellen Best has left us an accurate picture painted in the 1830s of the former 18th-century dairy at Howsam Hall near York where Delftware tiles cover the wall and the front of the stone dresser. Delftware tiles were also used in the former dairy built in 1779 at Brocklesby Park, Lincolnshire, where they ran in a double row above the marble dresser.

Wedgwood began the manufacture of Queen's Ware tiles during the 1780s and these proved popular for the interiors of dairies. 18th-century Wedgwood tiles have a hard cream body covered with a transparent glaze which if desired could be printed and painted on the glaze and were more durable than the more brittle and softer Delftware tiles.

A number of Georgian architects took a specific interest in designing dairies either as individual buildings in their own right or as part of larger farm complexes. Sir John Soane, Henry Holland, and S.P. Cockerell put their minds to style-conscious but at the same time functional and practical dairies.

Soane designed a free-standing dairy in 1783 in an archaic Greek style for Philip Yorke in the grounds of Hamels Park, Hertfordshire. This had a thatched roof which gave the dairy the idyllic rustic appearance favoured at the time, but it was also functional as the thatched roof helped to keep the temperature inside more constant.

Holland became somewhat of a specialist with his dairies at Althorp and Woburn. The dairy at Althorp, Northamptonshire, built in 1786–88 for Countess Spencer, has its walls

covered with Wedgwood tiles. The marble-topped dresser and tables still have their original Wedgwood dairy bowls and vases. He also designed the unusual Chinese Dairy at Woburn for the Duke of Bedford in 1791. Despite its exotic appearance, it is functional with a veranda around the building to deter direct sunlight and tiles in the interior to cover the walls below the marble dresser and the floor for cleanliness.

More exotic influences can be seen in the dairy at Sezincote, Gloucestershire, designed by S.P. Cockerell in the Moorish style in 1808, with tiled walls, stained glass, and a fountain in the centre. Just to show that he could design in any style, an alternative unexecuted design for a dairy at Sezincote in the Gothic style has survived.

The interest by the highest echelons of society in the dairy as part of the notion of the ideal pastoral life was highlighted by the French queen Marie Antoinette at the end of the 18th century when she would play at being a dairymaid at her small model farm Le Hameau at Versailles and the dairy at Rambouillet. However she did not set the fashion for this as is sometimes supposed. In England this was a trend already established to which the examples at Hampton Court, and later Hamels, Althorp, Woburn, and Brocklesby testify.

J.C. Loudon comments on dairy design in his *Encyclopaedia of Cottage, Farm and Villa Architecture* of 1833, and cites the dairy at Alnwick Castle as a good functional example with its veranda, thatched roof, white marble shelves, and white glazed tiles.

The fashion for state-of-the-art dairies continued in the Victorian period but was now linked to colourful machine-made decorative tiles. If the Georgian dairies had often been plain in their wall decoration with white or cream-coloured tiles, the Victorian dairy became highly decorative and polychromatic, as can be seen in the wonderfully preserved example at Windsor.

The dairy at Windsor was built under the direct patronage of Prince Albert, and shows all the best that could be incorporated into dairy architecture at that time. The dairy was built between 1858 and 1861 according to a design by John Thomas with an interior consisting of stained-glass windows, painted woodwork, statues, fountains, and walls covered from top to bottom with colourful block-printed Minton tiles, moulded ceramic panels with rustic scenes, and a frieze with ceramic portrait medallions of the Royal family. The non-slip ceramic floor has special channels beneath marble-topped tables down

which water can be sluiced for cleaning, while the windows incorporate an early form of double glazing to control the temperature. There are perforated tiles in the ceiling to allow for the circulation of air.

Not all Victorian dairies were tiled. The model dairy at Manderston, Berwickshire, designed by John Kinross in 1900 is built in an Early English Gothic style. It has a vaulted roof with a marble floor and walls that also make for excellent hygienic surfaces.

Numerous dairy factories sprang up throughout the second half of the 19th century, such as the one at Crouch Hill, London. One of the best preserved examples of this type is to be found in Dresden, Germany. There the Pfund Dairy was built in 1892 and tiled in a functional way. The great show-piece however is the large dairy shop which has a complete ceramic interior with tiled walls, ceiling and floor. The walls have elaborately painted scenes and designs on tiles made by Villeroy & Boch showing cherubs engaged in the processing of butter and milk, including tinned condensed milk which, among other places, was exported to Britain.

In Britain dairy factories would run chains of shops well into the 20th century, such as the Buttercup Dairy shops in Scotland and the Maypole shops in England. Figurative and decorative tiles were a standard part of the shop interiors and entrances. Contemporary dairy factory design is perhaps more hygienic than ever before, but less remarkable in its interior design with much use of plain tiles and stainless steel work surfaces showing the influence of the increasing effect of complex government regulations.

Davis, Alexander Jackson 1803–1892

American architect and designer

Alexander Jackson Davis was one of the leading American revival architects during the period from 1835 to the Civil War, working first in a Greek Revival style with his partner Ithiel Town (1784–1844), and then on his own in a Gothic Revival style. A major proponent of the integration of the building within its landscape setting, once he began to design on his own, he also believed in relating every function of the building to its interior appearance: he thus anticipated a later generation's concern with total design. His specific furniture designs, while few in number, are exquisite proof of his feel for the spirit and shape of the Gothic buildings on which he drew for inspiration.

Originally trained as a lithographer, at the age of 20, Davis was directed toward architecture by John Trumbull, the president of the American Academy in New York. Following several years as an apprentice, he began work as an architectural draughtsman, and showed an early interest in the design of country houses. His work attracted the attention of the highly successful Greek Revival style architect, Town, and the older man offered him a partnership in 1829. Davis was well aware of the ideas of the Oxford Movement that had swept through England, and he incorporated its spirit in major urban residences, churches, and public buildings, with the earliest major example of the form of English Collegiate Gothic being the Town and Davis's main building for New York University. In later years, Davis was to base his design for the Great Hall at the University on the Chapel of Henry VII at Westminster.

When Town retired from active practice, Davis turned his attention to more rural cottage designs, where he could indulge his taste for the Picturesque. He wrote and illustrated *Rural Residences* in 1837, with the support of many of the business and artistic leaders of the day. His practice flourished, with such major commissions as the 1838 residence for William Paulding, formerly called Knoll and now known as Lyndhurst. In addition to designing the exterior and the basic organization of the rooms – the normal way of working at the time – Davis designed every interior detail himself. He contracted with a furniture-making firm, Burns and Tranque, and with wallpaper designers and mantel artisans. He designed the walls so that the plaster would appear to be ashlar stonework; he used *trompe-l'oeil* graining in the passageways; he created built-in furniture to house objects meant for display. For the actual furniture, particularly for the major first floor public rooms, he created more than fifty designs for such objects: those for both

Davis: study for Neo-Greek double parlour in a New York house, c.1845 (New-York Historical Society)

wheelback and pointed chairs for the dining room epitomize his inventive taste.

When the building was expanded in 1864, the new owner hired Davis both to harmonize the additions with the original structure and to add some furnishings to replace some of those that had been removed. Some of the pieces are a little heavier, indicating that his Pugin-inspired designs were modified by the more ornate Victorianism that was probably demanded by the patron. The octagon dining table and heavier chairs are the main surviving examples of that modified Gothicism.

When dealing with public buildings, Davis also tried to integrate the interior design and the furnishings, with even stronger attention to function. This interest is best exemplified in his designs for a schoolhouse that was included in his later versions of *Rural Residences*, rather than in his completed college buildings for Virginia Military Institute, New York University, or the several other college buildings that Davis designed and saw to completion. His basic school design included a concentric seating arrangement facing the raised teacher's platform, in a room with skylights replacing conventional windows. By doing so, he provided more wall space for chalkboards, maps, and shelving, while avoiding the distraction of observing what was happening outdoors. He even devised a storage space for coats and hats in a hallway under the bell tower. The design was so well received that the

American Common School Society illustrated his design on the cover of their 1839 brochure and recommended it as the preferred form of schoolhouse design.

Much of Davis's best known work is through his collaboration with Andrew Jackson Downing, and the perspectival views and renderings of residences, garden seats, and various outbuildings that appeared in Downing's *The Architecture of Country Houses* in 1850. The two men remained partners in various projects from 1838 to 1852, when Downing died. Though the designs Davis produced through the partnership was exterior rather than interior, they reflect the coordination of all design elements that was the hallmark of his pioneering overall design concept. Until the Civil War, when declining demand and changes in taste pushed Davis's fame into history, his impact on ecclesiastic, rural domestic, school, and public architecture and design was tremendous. Although he lived until 1892, Victorian exuberance, changing political and social configurations, and a distaste for the moral basis that always accompanied Davis's commentary on his work, combined effectively to end his career thirty years before he died. All that remained was his work on the design and landscape for the group of houses that formed the Llewellyn Park Association at Belleville, New Jersey, where he lived most of the last years of his life. This project catered to a small group of like-minded businessmen who sought a retreat near, but not part of the city.

A new interest in overall design, not in the particulars of his eclectic taste or morality, finally created a new interest in Davis in the mid-20th century.

DAVID M. SOKOL

Biography

Born in New York, 1803. Educated at the Antique School, Philosophical Society (later merged with the Academy of Design), and at the Athenaeum, Boston, 1827; subsequently at the American Academy of Fine Arts, New York, and New York Drawing Association. Served as apprentice designer under Josiah R. Bradley, New York; draughtsman, Ithiel Town's office, New York, 1826; partner with Town, New York, 1829; opened own office New York, 1844. Designed illustrations for the writer on landscape gardening and house furnishing, Andrew Jackson Downing (1815–52), 1838–52; published *Rural Residences*, 1837. Designed furniture for specific commissions from the late 1830s. Died in New York, 1892.

Selected Works

The principal manuscript sources for Davis's work are in the Davis collections of the Avery Library, Columbia University, the Metropolitan Museum of Art, the New-York Historical Society, and the New York Public Library, all in New York, and in the Winterthur Museum, Delaware. Examples of Davis's furniture survive *in situ* at Lyndhurst, Tarrytown, New York. A full list of Davis's executed and unexecuted architectural projects appears in Peck 1992.

Interiors

- 1833 United States Customs House, New York City (building and interiors; with Ithiel Town)
- 1835–37 New York University Chapel, Washington Square (interiors; with Ithiel Town)
- 1838–42 Knoll, Tarrytown, New York (building, interiors and furniture): William and Philip R. Paulding
- 1842 Angier Villa, Medford, Massachusetts (building and interiors, in consultation with A. J. Downing)
- 1842–44 Wadsworth Atheneum, Hartford, Connecticut (building and interiors, with Henry Austin)
- 1842–49 Joel Rathbone House, Kenwood, New York (farmhouse, gate lodge and some furniture)
- 1854 Grace Hill, Brooklyn, New York (building, interiors and furniture): Edwin C. Litchfield
- 1855–59 Ericstan, Tarrytown, New York (building and interiors): John J. Herrick
- 1857 Gate Lodge, Llewellyn Park, West Orange, New Jersey (building and interiors)
- 1864–67 Lyndhurst (formerly Knoll), Tarrytown, New York (remodelling, additions, interiors and furniture): George Merritt

Day, Lucienne 1917–

British textile and wallpaper designer

During the 1950s Lucienne Day was arguably the leading British surface pattern designer of the day. Day was one of Britain's few designers to achieve an international reputation, and her work was in demand in both North America and continental Europe, in particular West Germany. Although primarily a designer of printed textiles, she also produced patterns for wallpaper, carpets and tableware. She counted among a sizeable and articulate group of designers in the immediate post-war period who, educated in the ideas of the Bauhaus, believed it part of their role to get good, affordable modern designs into ordinary homes.

Day was trained, first, at Croydon School of Art, and then at the Royal College of Art. When she left in 1940 her incipient career was put on hold by the war, although she taught part-time and did some design work for the dress trade. By 1946–47 she was getting enough design work to enable her to give up teaching, and was exhibiting her fabrics regularly at the Cotton Board's Colour, Design and Style Centre in Manchester, set up in 1940 to encourage industry to invest in good design and to raise public awareness of well-designed goods. In 1948 Day received an important commission for two chintz designs from Alastair Morton, Artistic Director of Edinburgh Weavers, a company with a reputation for high-quality innovative furnishing fabrics designed to complement modern developments in architecture. In their turn, the two designs (*Florimel* and *Elysian*, 1949) brought Day's work to the attention of Heal's who commissioned a design in a similar style (*Fluellin*, 1950).

The Festival of Britain in 1951 provided many young

Day: *Calyx* fabric, 1951, manufactured by Heal's

designers, Lucienne Day included, with an important showcase for their most innovative work. When her husband, the furniture designer Robin Day, was unable to find a really modern, yet moderately priced, furnishing fabric to complement the furniture in his section of the *Homes and Gardens* Pavilion at the Festival, Day persuaded Heal's to print one of her designs, *Calyx*, especially for it. The company was initially sceptical that such an abstract design could possibly have any commercial appeal but were proved wrong. *Calyx* was a huge success, especially in the US, where it sold to more than 200 leading North American decorators through Greeff Fabrics Inc. of New York. Inspired by contemporary abstract art, *Calyx* is a highly original pattern and justifiably regarded as a landmark in the history of 20th-century design. It took a gold medal at the 1951 Milan Triennale and won the coveted International Design Award of the American Institute of Decorators in 1952, the first time that the award had gone to a British designer. It spawned a number of imitations, sold for some ten years and helped to establish Day's international reputation.

Following the success of *Calyx*, Day received further commissions from Edinburgh Weavers and other leading British textile manufacturers such as Sanderson's and Liberty, but her name became inextricably linked with that of Heal's. Although never contractually bound to the company, she worked for them almost exclusively, designing four to six furnishing fabrics a year from 1952.

Day's work for Heal's falls into a number of distinct stylistic groupings. During the first half of the 1950s she was widely imitated and did much to popularise the abstract style, contributing to a revolution in the taste of the British consumer. In addition to purely abstract patterns, many of Day's designs of that period (*Trio*, 1954 and *Herb Antony*, 1956 are prime examples) were based on abstracted plant forms, representing a radical reworking of the English chintz tradition. Her colour palette – a limited range of bright colours

sharply contrasted – was equally innovative. In Day's later work for Heal's (*Apex*, 1967 or *Sunrise*, 1969, for example) the startling colour combinations and uncompromising geometry form a stark contrast to the relatively small-scale, sometimes whimsical early abstract designs. Partly these patterns grew out of her general move in the direction of more large-scale designs, but they also met the company's demand for patterns to satisfy the growing contract market of the 1960s.

Many of Day's designs counted among Heal's critical as well as commercial successes. Four early ones – *Ticker-tape*, *Spectators*, *Linear* and *Graphica* – jointly took the prestigious Grand Premio at the Milan Triennale in 1954, an exhibition dominated throughout the 1950s by Scandinavian design. *Triad* (1955) was used in all the bedrooms of the reconstructed Strand Palace Hotel in London and in the Leofric in Coventry, one of Britain's most modern hotels of the period, while *Ducatoon* was awarded a gold medal at the California State Fair of 1959, testifying to the enduring popularity of Day's work in America.

Day began designing wallpapers, an obvious corollary to textile design, in 1951 when the British manufacturer John Line commissioned a design (*Provence*) from her to be included in a range of modern wallpapers called "limited editions". It was shown at the Festival of Britain, together with three others which she designed for Cole & Sons. Between the mid-1950s and mid-1960s Day produced occasional designs for inexpensive, machine-printed wallpapers manufactured by Crown and, in 1954, the German firm Rasch Tapetenfabrik – one of the earliest producers of Modernist wallpapers, who had put out a range for the Bauhaus years before – also began to commission wallpaper designs from her. In contrast to other designers of the period who were producing large figurative patterns, Day preferred wallpaper to be recessive, especially if it were being used in a scheme which also included patterned textiles and possibly patterned carpets, and the majority of her designs were simple one- or two-colour abstract linear patterns.

An exhibition of Rasch artists at Osnabrück Museum in 1956, which included Day's work, led to an invitation from Rosenthal Porzellan AG to design patterns for their new "Studio Line" tableware shapes, launched in 1955 and designed by leading international designers such as Raymond Loewy (US) and Tapio Wirkkala (Finland). Day worked for Rosenthal for ten years from 1957, the only British representative on their design team. Back in the UK, in the late 1950s, she extended her design repertoire to include carpets and table linens. Both were successful in capturing a market not hitherto notable for innovative design. Her first Axminster design, *Tesserae*, for Tomkinson's Ltd. of Kidderminster, was named one of twelve products of outstanding design in 1957, while a set of glass cloths for Thos. Somerset & Co. of Belfast took the same award in 1960.

By 1960 Day was as well known in Europe as in Britain, a fact which is evident from the many features and full-length articles on her work which appeared in the pages of such journals as *Bonytt* (Norway), *md: moebel und decoration* and *Gebrauchsgraphik* (Germany). In 1962 she was elected a Royal Designer for Industry in recognition of her contribution to British design and exports.

Day gave up designing for industrial production in the mid-

1970s and now designs pieced silk wall-hangings known as silk mosaics which are made to commission and for exhibition.

JENNIFER HARRIS

Biography

Born Désirée Lucienne Conradi, in Coulsdon, Surrey, January 1917. Trained at Croydon School of Art, 1934–37; studied design, Royal College of Art, London, 1937–40. Married the designer Robin Day (b.1915) in 1942: 1 daughter. Tutor, Beckenham Art School, 1942–47. Active as a freelance commercial designer of textiles from 1947 to 1970s; supplied designs for Cavendish Textiles (John Lewis Partnership) from 1947, Edinburgh Weavers, 1948–52, and Heal's c.1950–1970s. Designed wallpapers for John Line & Sons Ltd. from 1951, for Crown Wallpapers, 1954–64, and for Gebr. Rausch & Co., Bramsche, mid-1950s. Designed porcelain decorations for Rosenthal ceramics, 1957–59. Worked, with Robin Day, as design consultant to the John Lewis Partnership, 1962–87. Active as a designer of wall-hangings and silk tapestries from 1970s. Exhibited at the Festival of Britain, London, 1951. Elected Royal Designer for Industry, 1962; Master of Faculty of Royal Designers for Industry, 1987–89.

Selected Works

Collections of Day's textiles and wallpapers are in the Victoria and Albert Museum, London, and the Whitworth Art Gallery, Manchester.

Further Reading

A well-illustrated and informative monograph on Day is Harris 1993 which includes a select bibliography and a checklist of her designs for Heal's, Edinburgh Weavers, and British Celanese.

Day Beds and Chaises Longues

Day beds and chaises longues are essentially frontally elongated seated units. Closely related to beds and sofas, they differ from the first in that they are for daytime use and from the second in that they are intended for a single person. They have their roots in the low, rectangular banquet couches and beds used in ancient times and, given that lounging or sleeping during the day is traditionally an activity restricted to the leisured classes, they have been a fashionable feature in many wealthier homes since their introduction in the late 16th century. Unlike more formal types of seating, they have also

been associated mainly with private and intimate settings such as boudoirs and bedrooms. They have been constructed from a variety of woods and other media, and were almost always upholstered or fitted with cushions. Their design has reflected changing fashions and styles, but as an emphasis upon comfort – which began in the 18th century – became more significant, so the body-conforming qualities of day beds and chaises longues became more pronounced. This tendency reached its apogee in the deep-buttoned, highly-sprung examples produced in the last decades of the 19th century but is still evident in some of the stark modern designs which appear to be composed along the abstracted lines of the human torso. Some of the most contemporary models appear more like functional sculpture than furniture.

Day beds have their antecedents in many cultures of the ancient world. Ceremonial couches in the form of attenuated animal bodies, the back serving as the resting surface, have been found in ancient Egyptian tombs, including that of Tutankhamun. Most evidence points to their having been used primarily in embalming and funerary rites; to what extent they might have served other functions is unclear, yet their form is undeniably associated with other, later examples of day beds. Ancient Greek and Roman sculptures, reliefs, and vase paintings dating back to the 6th century BC depict innumerable examples of the popular banquet couches, or *klines*. These furnishings had a two-fold purpose: they could be used to sleep upon, or, lined up end to end and with small tables with food and wine by their side, they served as recliners for those who were dining. It has been suggested that this double function was imported from the Near East, but regardless of the exact origin, this use became the standard custom for festive occasions in Greek and Roman times.

Similar early examples are known to have existed in the Far East. In China the *ta*, or couch – as distinct from the *chuang*, or bed – has been one of the most important types of furniture for centuries. It was a central feature of a man's study, and was given special attention by Ming writers addressing issues of taste; the *chuang* served a comparable function for wealthy women. Even after upright or high seating was introduced in the 8th century, the *ta* remained a common piece of furniture upon which one could kneel or recline. Before the 18th century, decorative emphasis was placed on the textiles which adorned the relatively simple *ta*, but after this period the focus shifted to surface embellishment, chiefly lacquered designs. As is the case with other cultural artifacts emanating from the Far East, substantial symbolic meaning was attached to the *ta*; they were part of the moral and aesthetic discourse of the period.

Day beds existed in Europe from at least the Middle Ages, although their use did not become commonplace until the 16th century. The form seems to have evolved out of the *couche* or *couchette* (the French *coucher* means to go to bed), a simple type of bed which served both night-time and daytime use. By the 17th century a distinction appears to have been made between couches and day beds, the latter now bearing a single slanted endboard or arm (versus one on each end) against which one rested. However, this terminology was occasionally confused, and one finds the word couch applied by English writers to the single- as well as double-ended type. French commentators also called both versions *lits de repos* (literally,

Day Beds: Grecian Squab by Thomas Sheraton, 1803

day bed) or *reposoirs*, but these terms were most often applied to those with a single end.

Perhaps the more important distinction between the two is in their use. Day beds became the less formal type of furniture, while couches evolved into objects of ceremony, often bearing elaborate canopies. By 1700, day beds had become essential furniture for most fashionable ladies and were usually installed in bedrooms or closets where they could be used for relaxing and lounging during intimate conversations with other ladies and friends. As comfort and ease became more important concerns, they increasingly became vehicles for the most sophisticated arts of the upholsterer. Their basic structure up until this time had been of a low, narrow and rectangular palette raised on four to eight shaped or turned feet, featuring drop-in or loose cushions, and bolsters or pillows for added comfort. The endboard was vertical or slanted, sometimes hinged, and a few rare and exceptionally elaborate examples were designed with flying testers and mirrors built into the endboards. Frames were of wood, often with a caned back and seat. Typically, day beds were placed with a long side against the wall, and on occasion they were made en suite with a double-ended couch and / or sofa (a couch with a back as well as sides). They were always an indication of status and wealth.

Chaises longues are a type of day bed or *lit de repos* which evolved in France in the early 18th century. Their name (literally "long chair"), also betrays their close resemblance to chairs, having upright backs and elongated seats. To maximize comfort, their backs were nearly always rounded (in which case the period appellation was *duchesse*) and they were deeply upholstered or caned, and fitted with soft loose cushions. If the foot was surrounded by a low curving back, the piece was said to be *en bateau* or *en gondole*. If the chaise longue was made in two or three sections which could be separated as individual seating units – a stool and an armchair, for instance, it was then referred to as a *duchesse brisée*. In fact by the mid-18th century *duchesse brisées* had superseded chaises longues in popularity, their form allowing for flexibility of use, and they began to be copied abroad by furniture designers like the British cabinet-maker George Hepplewhite. Other 18th-century variations on the general chaise longue form include *turquoises* or *sultanes* (double endboards of equal height, with or without loose cushions), *veilleuses* (full sloping back which wrapped around three sides), and *meridiennes* (double, outward scrolling endboards of equal height, with or without loose cushions). The *récamier* is simply another term for *meridienne*, popularized by the beautiful and widely celebrated one owned by Madame Juliette Récamier.

With the increasing influence of Neo-Classicism at the end of the 18th century, many furniture types including day beds adopted the newly fashionable antique forms. Cabinet-makers on both sides of the Atlantic loosely copied Greek and Roman prototypes, sometimes calling their pieces "couches", but often simply applying whatever name was currently in vogue. There were *récamier* sofas, Grecian squabs, chaises longues, among others. As before, these furnishings were generally used in boudoirs and were sometimes specially designed to fit into a niche or alcove. The French architects François-Joseph Bélanger, and Percier and Fontaine, both designed rooms with elaborately tented or draped day beds set into the recesses in the walls.

During the 19th century, furniture arrangements became less formal, and reception rooms were increasingly regarded as the precinct of the ladies of the house and were decorated in appropriately feminine styles. As a result, the chaise longue, in particular, moved out of the bedroom and became a popular item of furniture in sitting rooms and parlours. It was ubiquitous in the densely furnished drawing rooms of the late Victorian period and its design was well-suited to the plush fabrics and deep-buttoned styles that were fashionable in wealthier homes. Day beds were still mainly located in private areas but became more complex. Mechanized designs made their debut, as did multiple-use designs some of which combined a reclining surface with storage units, and others which converted from a sofa into a day bed by removing a front rail. As exotic oriental styles became fashionable in the last quarter of the century, ottomans and divans also proved immensely popular, especially in Moorish-style sitting rooms, studios and smoking rooms.

A renewed interest in day beds both as an expression of the inherent beauty of the human form and as a measure of modern cultural values has marked designs of the 20th century. The simple and eloquent day beds of designers such as Le Corbusier, Marcel Breuer, and Charles Eames have streamlined and open structures of industrial materials like steel tubing and plywood. Additionally, the futuristic and amusing models of Olivier Mourgue, Joe Colombo, and even Roberto Matta have emphasized standardization of form, the use of materials developed post-war, and the sculptural possibilities of furniture. Like many furniture designs of recent decades, day beds and *chaises longues* are manufactured today largely with comfort, manoeuvrability, and ease of maintenance in mind.

Decorating Manuals

Although information relating to interior design and decoration has been disseminated in various forms since the Renaissance period – as individual engravings, as prints bound in book form, and in treatises on art, architecture and ornament – decorating manuals are predominantly a feature of the 19th and early 20th centuries. They should also be seen as distinct from pattern books or compilations of existing rooms and furnishings in aristocratic homes, both of which flourished in most parts of Europe during the 18th and 19th centuries. Generally profusely-illustrated, pattern books were usually produced by architects and designers and were intended as copy-books of decorative examples for other professionals and the trade; notable examples include anthologies such as Thomas Hope's *Household Furniture and Interior Decoration* (London 1807) and Percier and Fontaine's *Recueil de décorations intérieures* (Paris 1801). Publications such as J.-F. Blondel's *De la Distribution des Maisons de Plaisance et de la Décoration des édifices en général* (Paris 1737-38) were more theoretical but were still mainly directed at a specialist audience. Decorating manuals, by contrast, had a much wider circulation, were frequently more text-based and were usually directed at a non-professional as well as professional readership.

Greater interest in interior decoration developed during the first decades of the 19th century as an outgrowth of the Industrial Revolution. Economic expansion brought an increased production of material goods. By 1840, newly wealthy industrialists and prosperous middle-ranking workers were in a position to indulge in home furnishing and decoration, previously the prerogative of the upper classes alone. While works like J.C. Loudon's *Encyclopaedia of Cottage, Farm and Villa Architecture and Furniture* (London 1833) followed the example of treatises and books from preceding centuries by providing exemplary types of design, there was also a much stronger emphasis upon consumers of architecture and design, and a new educational tone began to enter such publications. Authors of the emerging Victorian period, faced with a multitude of decorative styles, ornamental patterns and new materials, felt the need to explain design options to the growing numbers of consumers.

The interiors of important houses continued to be profiled, as can be seen in Louis Normand's *Paris Moderne ou Choix de Maisons* (Paris 1837-42), but the rise of popular new styles, and the resultant eclecticism, was featured in such diverse works as François Thiollet's *Nouveau Recueil de Menuiserie et*

de Décorations Intérieures (Paris 1837), Richard Bridgens's *Furniture with Candelabra and Interior Decoration* (London 1838), and Samuel H. Brooks's *Designs for Cottage and Villa Architecture* (London 1839). Many of these books were still principally read by architects and members of the trade but publications such as Mrs. William Parkes's *Domestic Duties* (London 1825 and New York 1831) whetted the middle-class public's appetite for discussions on the decoration and philosophy of interiors.

The London Great Exhibition of 1851 brought redirections in writings on interior decoration, to accommodate the design reform movement. Decorating manuals were now imbued with the need to "improve taste" and educate the consumer. Manufacturers and purchasers alike required more information and guidance on how to combine sound design principles with appropriate adornment. Consumers were asked to consider issues of domestic presentation and comfort. In addition to professional architect-designer authors, a new category of writer, the "professional" (albeit usually unpaid) adviser, now emerged. Several of these authors were women, and interior decoration came to be regarded increasingly as an activity that was not only sanctioned for women but that also came naturally to the female sex. Two titles exemplify the split in gender approach, Isabella Beeton's *Book of Household Management* (London 1861) and Robert Kerr's *The Gentleman's House* (London 1864). No book was more influential in its advice, in Britain and particularly in America, than Charles Eastlake's much reprinted *Hints on Household Taste* (1868). Significantly, this work was a recasting of articles previously published in general interest magazines (the *Cornhill Magazine*, *Queen*, and the *London Review*), and it was clearly intended to have a fairly wide appeal. Its author's promotion of quality and simplicity in interior decoration, complete with directives and exhortations on avoiding purely fashionable effects, as well as its readable, accessible style, was echoed in many subsequent manuals.

Although many titles from Britain were reprinted in America, independent publishing on decoration was plentiful in the United States, particularly in the 1850s and 1860s. Andrew Jackson Downing's *The Architecture of Country Houses* (New York 1850) and Gervase Wheeler's *Rural Homes; or, Sketches of Houses Suited to American Life* (New York 1852) provided practical, masculine perspectives. The increasing numbers of female consumers could turn to Miss Leslie's *Lady's House Book* (Philadelphia 1854) and a popular work by educators Catherine Beecher and her sister, Harriet Beecher Stowe, *The American Woman's Home* (New York 1869), for a more moral, advisory tone.

By the 1870s, the development of "how-to" decorating manuals was fuelled by a growth in literacy and disposable incomes. There was a consequent increase in these publications as guides to "appropriate" furnishing. Contemporary books surveyed the multiplicity of design styles available to consumers, complete with the mixing of antique and new pieces. An example of this is C.J. Richardson's *The Englishman's House from a Cottage to a Mansion* (London 1870). The artistic nature of current decorative fashions can be seen in Eugène Viollet-le-Duc's *Habitations modernes*, 2 vols. (Paris 1875-77) and Harriet Spofford's *Art Decoration Applied to Furniture* (London 1878). Macmillan's "Art at

Home" series, introduced from 1876 to 1878 and including W.J. Loftie's *A Plea for Art in the House* (London 1876) and *The Dining Room* (London 1878), was especially popular and provided a room-by-room guide to the decoration and furnishing of the fashionable home. Other books also increasingly emphasized newly fashionable styles. Works such as Robert Edis's *The Decoration and Furniture of Town Houses* (London 1881) and Clarence Cook's *The House Beautiful* (New York 1878) advocated the composition of interiors according to prevailing late Victorian "artistic" taste. Agnes and Rhoda Garrett, who had successfully established their own interior decoration firm, published their trend-setting opinions in *Suggestions for House Decoration* (London 1876, US edition 1877).

Lighter treatments of walls, furniture and colours can be seen in manuals that stress such contemporary design solutions over revivalist-inspired interiors, as in one of Mrs. Haweis's most acclaimed guides, *The Art of Decoration* (London 1881). By 1888, even the lower orders were to be instructed in appropriate furnishing and decor from guides such as Mrs. J.E. Pantton's frequently consulted manual, *From Kitchen to Garret* (London 1887). This guide advised young housewives on everything from how to decorate within a budget to the correct arrangement of place-settings. And Mrs. Pantton herself also wrote a regular column for a number of women's magazines and offered a more personal service with consultations available by mail or visits.

Publications from the last decade of the 19th century dealt with the new realities of modern life. Decorating manuals such as Mrs. Orrinsmith's *The Drawing Room* (London 1877), and Rosamund Watson's *The Art of the House* (London 1897) stressed schemes for important rooms, and were not concerned with large houses exclusively. Other books, however, like Edith Wharton and Ogden Codman's *Decoration of Houses* (1897), which strongly influenced Elsie de Wolfe's later *The House in Good Taste* (1913), still emphasised aristocratic styles, in particular those of the French 18th century. Works from this time championed the young professional decoration industry and cited design goals based on simplicity and efficiency. Nevertheless, no one viewpoint or longed-for national style prevailed. Battles raged in newspapers and periodicals over the correct handling of interior decoration. Books reflected popular stances, as in a work by critic H.J. Jennings, a solid despiser of the newborn Art Nouveau style, who illustrated his *Our Homes and How to Beautify Them* (London 1902) with interiors by prominent, established furnishing firms such as Waring & Gillow. The exchange of ideas across Europe can also be seen in Hermann Muthesius's *Das Englische Haus* (Berlin 1904–05) which praised British commercial production and creations by the Arts and Crafts Movement.

The quickened pace of mechanization, and subsequent innovations in lighting, heating and sanitary conveniences required explanation in another wave of books. Many of these early 20th century manuals were concerned with the effective integration of these innovations into domestic settings. Edwardian interiors, influenced by William Morris and revivalist styles, can be seen in W.S. Sparrow's *Hints on House Furnishing* (London 1909). Good photographic images of interiors became more widely available for use in books. However, the impact of the Modern Movement altered approaches to

interior furnishing, with spokesmen such as Adolf Loos and architect Le Corbusier scorning older modes of decoration. Interestingly, the types of middle-class decorating manuals established during the 19th and early 20th century survive to some extent to the present day. They exist as guides to specific styles, the works of individual designers, or design firm approaches. Books about interior decoration still dispense lifestyle advice and provide views of interior arrangements for consumer inspiration.

Publications

In the absence of a general survey on Decorating Manuals, the most useful starting point is often the individual publication itself: for a selected list see below. A detailed discussion of late 19th and early 20th century British examples appears in Neiswander 1988.

- Barker, Lady, *The Bedroom and the Boudoir*, London, 1878; reprinted with *The Drawing-Room* by Lucy Orrinsmith and *The Dining Room* by M.J. Loftie, New York: Garland, 1978
- Beecher, Catharine E. and Harriet Beecher Stowe, *The American Woman's Home; or, Principles of Domestic Science, Being a Guide to the Formation and Maintenance of Economical, Healthful, Beautiful, and Christian Homes*, New York, 1869; reprinted New York: Arno, 1971
- Beeton, Mrs. [Isabella Mary], *Book of Household Management*, London, 1861; reprinted London: Chancellor Press, 1982
- Cook, Clarence, *The House Beautiful: Essays on Beds and Tables, Stools and Candlesticks*, New York, 1878; reprinted New York: Dover, 1980
- de Wolfe, Elsie, *The House in Good Taste*, New York: Century, 1913; London: Pitman, 1914
- Eastlake, Charles Locke, *Hints on Household Taste in Furniture, Upholstery and Other Details*, London, 1868; 4th edition 1877; reprinted New York: Dover, 1969
- Edis, Robert W., *The Decoration and Furniture of Town Houses*, 2nd edition London, 1881; reprinted, with introduction by Christopher Gilbert, Wakefield: EP, 1972
- Falke, Jacob von, *Art in the House: Historical, Critical, and Aesthetical Studies on the Decoration and Furnishing of the Dwelling*, Boston, 1879
- Garrett, Rhoda and Agnes, *Suggestions for House Decoration in Painting, Woodwork and Furniture*, London, 1876; reprinted with *The Art of Decoration* by Mary Eliza Haweis, *Dress* by Margaret Oliphant, and *Music in the House* by John Hullah, New York: Garland, 1978
- Haweis, Mary Eliza, *The Art of Decoration*, London, 1881; reprinted, with *Suggestions for House Decoration* by Rhoda and Agnes Garrett, *Dress* by Margaret Oliphant, and *Music in the House* by John Hullah, New York: Garland, 1978

Delafosse, Jean-Charles 1734–1789

French *ornemaniste* and architect

Trained as a sculptor, under the carver Jean-Baptiste Poulet, Jean-Charles Delafosse later worked as an architect and designer. By 1767 he was describing himself as professor of drawing at the Académie of Saint-Luc, and he was appointed assistant professor of geometry and perspective in 1777. His architectural commissions included two houses erected in the rue Faubourg Poissonnière in Paris between 1776 and 1783. Yet of far greater importance as far as the history of interior design is concerned was his work as an engraver of designs for ornament. He published approximately 500 plates, illustrating numerous architectural features and almost every type of domestic furniture, which were not only enormously influential in France but which were also issued in several editions abroad. Like his contemporary, Jean-François Neufforge with whose work his is sometimes compared, he developed an uncompromising, almost brutal form of classicism, and today he is regarded as one of the originators of the massive Louis XVI style.

The majority of Delafosse's engravings were published under the title *Nouvelle Iconologie Historique*, a work that was the result of many years study and that included designs prepared over several years. The first edition was issued in 1768 and comprised 111 plates; a second edition containing 258 plates appeared in 1771 and by 1785, with the publication of a third edition, Delafosse's oeuvre amounted to nearly 400 plates. The engravings initially consisted of a series of designs for trophies. To these were added designs for fireplaces, monuments, fountains, consoles, vases, friezes, medallions, cartouches, pendules, chandeliers and furniture of all kinds.

The engravings in the *Iconologie* were tied together by a complex and comprehensive iconography, interpreted in the

lengthy prefaces in which Delafosse explained his aim as to represent the whole world in allegorical terms. He focused on themes such as the four elements, the four parts of the world, and the four seasons, but despite the grandiosity of this endeavour the iconography is as times more confused than consistent. The plate representing England, for example, is a cluttered composition with a collection of symbols of somewhat dubious applicability; masks and leopards appear among the three architectural orders along with military equipment, a papal tiara and a chained crown. Although this mixing of traditional representation with images drawn from his own imagination is what constitutes much of Delafosse's appeal, contemporaries were not surprisingly quite critical of such tendencies and the architect and theoretician Jacques-François Blondel described him in 1774 as "a man of genius but inconsistent". This inconsistency is perhaps most evident in the engravings of trophies dedicated to the nations, where the subjects were clearly subordinate to the designs and where there seems to have been little serious intention to incorporate what was known of each nation at the time, especially concerning exotic cultures.

The designs themselves drew heavily on ancient sources and represented a personal and innovative reworking of classical ornament that provided a seemingly endless variety of source material for craftsmen of many kinds. This ornament included versions of the Greek fret, twisted columns, foliated scrolls, garlands of laurels and roses, rams' heads, bucrania and lions' masks, some drawn in a style that echoed the heaviness of Baroque design, but the majority illustrating the severity of early Neo-Classical design. The second edition was especially important in disseminating the Louis XVI, or transitional style, and its designs for trophies, vases and chandeliers, combined elements of ancient decor in a tasteful, sober and accessible manner. The third edition was less original but was no less influential. It related more specifically to furniture, and combined antique motifs with curving Rococo profiles embodying the traditional period of 1760–1770. Several of the motifs from the first and second editions were used to decorate the exterior and interior of the Hôtel Tison, which Delafosse began in 1776. Lions' snouts and laurel branches, for example, are featured on the main entrance, while friezes of foliage appear between the storeys, and in the entrance passage, two niches protect antique urns decorated with interlaced and laden with festoons.

Many of Delafosse's architectural compositions bear a close resemblance to the work of the Italian engraver, Giovanni Battista Piranesi. Only the most unorthodox of French designers of this period were susceptible to the Piranesian rich decorative scheme, so this affinity was quite unusual. Moreover, its origins were somewhat unclear for it is not known whether Delafosse ever visited Italy. Nevertheless, several of the engravings in the 1771 *Iconologie* reveal specific borrowings from Piranesi although they also retain a distinctive character that is clearly Delafosse's own.

Delafosse's other books of trophies, published between 1776 and 1785, and in particular the *Attributs d'Amour*, also seem to have enjoyed considerable popularity and the designs were often executed, especially in marquetry. Pictorial marquetry first appeared on French furniture in the mid-18th century and remained fashionable throughout the reign of

Louis XVI. Delafosse played an important role in the spread of this fashion during the 1770s. His engravings were sold by the gilder Jean-Félix Watin and by several dealers such as Daumont, in the rue Saint-Martin, and Chereau, in the rue des Mathurins, and were clearly copied by a number of ébénistes, bronziers and other craftsmen. A table stamped by Adrien Delorme, now in the Victoria and Albert Museum, for example, has a top veneered with a design copied from the frontispiece to Delafosse's *Livre de Trophées Contenant Divers Attributs Pastorals*. Other pieces in the Wallace Collection also contain marquetry incorporating the same aforementioned frontispiece while an anonymous writing desk is decorated with a military trophy made to Delafosse's design. Nevertheless, the cost of reproducing the intricate detail and elaborate decoration typical of Delafosse's work was prohibitive even for the wealthiest patrons, and Félix Watin, who also dealt in furniture, offered to supply his customers with simplifications or substitutes of Delafosse's designs. Prints after Delafosse were also owned by the Sèvres factory, and Franz Ignaz Günther copied some of his vases for the Nymphenburg garden in Munich, c.1770.

Delafosse is remembered chiefly as an *ornemaniste*, whose engravings encouraged a taste for antique motifs – notably bucrania, heavy drapery, and serpents – among contemporary ébénistes, bronziers and silversmiths. His work is also characterized by extensive use of garlands – laurel, oak and floral. But unlike the more elegant offerings of Rococo designers, these are drawn in a compact style and it is this architectural heaviness, directly inspired by ancient examples, that also distinguishes the early massive form of the Louis XVI style from later kinds of Neo-Classicism.

PIA MARIA MONTONEN

Biography

Born in Paris in 1734. Apprenticed to the carver Jean-Baptiste Poulet, director of the Académie de Saint-Luc, Paris, 1747. Worked in Corsica and Paris. Active as a designer of ornament and furnishings from 1767; architectural commissions date from the late 1770s. Appointed professor of drawing, Académie de Saint-Luc, 1771; made assistant professor of geometry and perspective, 1777. Published numerous engravings, including the *Nouvelle Iconologie*, from 1768. Member, Académie of Bordeaux, 1781. Died in Paris, 11 October 1789.

Selected Works

A collection of Delafosse's designs for chimneypieces and other architectural ornament is in the Musées des Arts Décoratifs, Paris. Additional drawings are in the Kunstbibliothek, Berlin, the Victoria and Albert Museum, London, the Cooper-Hewitt Museum, New York, and the Ecole Nationale des Beaux-Arts, Paris.

Delaunay, Sonia 1885–1979

Russian painter and designer

Sonia Delaunay was a pioneering painter who successfully applied abstract art forms to interior design. Between 1905 and 1925, with her second husband Robert Delaunay, she evolved the theory of Simultaneous Contrasts, creating abstract paintings by juxtaposing pure blocks of colour to produce both harmony and dissonance. Delaunay's colour relationships were calculated using mathematical precision combined with theoretical ideals. These complex ideas were integrated into all aspects of her work, reflecting her belief that there was no clear boundary between art and design.

Her departure into diverse media directed her down a different path from that taken by most other avant-garde artists of her time. Although her important perspectives contributed to similar theories then developing in Germany, Russia and Holland, they had a more personal application. Delaunay widened her experience of what art was and developed new approaches and definitions through her designs.

The first embroidery she created, in 1909, was considered to be a breakthrough in her development: the expressive potential of the satin stitch wallhangings was liberating. As a painter

she was always concerned with surfaces, and the structure of the embroidery allowed her to explore surfaces in a new way, breaking with the conventions of her academic training to use colour more freely. From this point Delaunay explored many media and always remained intrigued by the surfaces and patterns of other cultures, both ancient and modern.

Her earliest interior designs were those for her own home, begun when her son was born in 1911 and when domestic life grew increasingly important. From their onset the highly individual interiors were extensions of her paintings: theories of colour and form were successfully transferred to walls, ceilings and fabric without losing either aesthetic expression or practicality. Art came out of her daily experiences and could, therefore, be fed back into everyday items, transforming them with complete validity. When making an appliqué cover for her son's crib, she created a design with the same intensity of colour and form as her paintings. The cover was far ahead of its time and was declared to be Cubist; her explorations in abstraction developed more intensely from this point. Working with textiles encouraged her to experiment, and she went on to create curtains, cushion covers, and lampshades, items that allowed her to explore her fascination with surfaces. She continued to explore colour theory while experiencing a constant interplay between her painting and her environment. This cross-fertilization, combined with travel, added new confidence to her work.

Her reputation for innovative interior design grew as she applied her theory of Simultaneous Contrasts to various surfaces, and she went on to combine these developments with architectural form. A large-scale church mural was the first of many commissions in which she successfully combined art and architecture. She was to receive many mural commissions, on both a large and small scale, throughout her life.

In 1918 Delaunay established Casa Sonia a small shop in the most fashionable area of Madrid. Its modern interior was simple: white walls and raffia flooring provided a perfect foil for the colourful objects on sale: the cushions, lampshades and painted accessories stimulated commissions to design domestic interiors for wealthy Spanish clients. On a grander scale she conceived dramatic colour schemes for the Petit Casino which opened in Madrid in 1919. The recognition gained in Spain preceded her return to France, enhancing her reputation. A commission to design a book shop, Au Sans Pareil, in Neuilly brought a great deal of publicity. The strength of the geometric designs established her in Paris as an interior designer of distinction.

The 1925 Exposition des Arts Décoratifs et Industriels placed France firmly at the forefront of new movements in art and design, and Delaunay was undoubtedly one of the major successes of this event. Her *Boutique Simultanée* encapsulated the aims of the exhibition and fused architecture, fine art, and design into one small space, gaining her international acclaim.

Not content to keep repeating herself, Delaunay went on to design furniture. Seating was upholstered in her fabrics and contrasting wood veneers were formed into Simultaneous surfaces. Together with matching carpets and rugs they provided the perfectly integrated scheme. As always, these pieces were practical, designed to complement a client's lifestyle. This ability to meld aesthetics with function in an uncomplicated way represented a humane balance between the

austere Modernism of Russian and German design, and the sophisticated and glamorous Art Deco interiors of the same period.

Delaunay evolved a method of manipulating textiles which related them to the function of architecture, and walls were covered with her fabrics to emphasize a room's structure. This greater focus on the entire wall surface led to the further development of wall decoration – impressive hangings and murals explored the structural possibilities of materials in order to integrate them more fully with the building. Her designs for the cinema and theatre employed the same attention to colour and form which she manipulated to echo the mood of the production. Her synthesis of interiors, furniture, and costumes showed a mature understanding of multiple design fields. This creativity led to business commissions and collaborations which investigated the concept of “public” art. The 1937 Exposition Internationale des Arts et Techniques Appliqués à la Vie Moderne in Paris brought two commissions for murals, one of which earned her a medal.

Her daring and her technical control continued to bring public appreciation in her later years. In the 1950s she returned to textiles and designed curtains and tapestries. Both the Gobelin and Aubusson tapestry works produced a number of her large-scale designs with their carefully balanced colour combinations. Her artistic integrity was never compromised as she was able to treat all media with equal validity. The technicalities were the same and the fascination with colour, so essential to her life, had no limits. She placed it everywhere; using its transforming qualities to add movement and vibrancy to everyday existence.

The innate talent that was evident in 1901, and still productive in the 1970s, earned Sonia Delaunay a widespread reputation as a distinguished artist and designer. Her vision and commitment, which dramatically influenced modern interiors by expanding the boundaries of what was possible, was formally honoured: she was granted a number of prestigious awards including the Grand Prix Ville de Paris (1973) and the Légion d'Honneur which she received in 1975.

BRENDA KING

Biography

Sonia Ilinichna Delaunay-Terk. Born Sarah Stern in Gradizhsk, Ukraine, 14 November 1885. Moved to St. Petersburg to live with her maternal uncle, 1890; adopted his surname, Terk. Educated in St. Petersburg until 1902; studied drawing and anatomy under Ludwig Schmidt Reutter at the Kunstakademie, Karlsruhe, 1903–04; studied painting at the Académie de la Palette, Paris, 1905. Married 1) Wilhelm Uhde, 1908 (divorced 1910); 2) the French painter Robert Delaunay, 1910 (died 1941): one son. Active as a painter and graphic artist, Paris from c.1905; involved with embroidery from c.1909; began designing bookbindings, lampshades, curtains, mosaics, posters, and interior schemes, c.1913. Lived in Portugal (1915–16) and Spain (1917–18) during World War I; opened the Casa Sonia, Madrid, to sell her designs, 1918; met Sergei Diaghilev and designed costumes for his production of *Cleopatra* in London, 1918. Returned to Paris, 1920, and became closely associated with Dada and Surrealism. Opened a fashion atelier with Jacques Heim, Paris, 1924; designed interiors and furniture, and from 1923 increasingly concentrated on textile design. Almost exclusively involved with painting from c.1931. Moved to Grasse, Provence, 1941; returned to Paris, 1945. Member, Abstraction-Création group, 1932; founder-member with Robert Delaunay and others, Salon des Réalités Nouvelles,

1939, and Groupe Espace, 1953. Exhibited at numerous national and international exhibitions including the Paris Exposition des Arts Décoratifs et Industriels, 1925, and the Paris Exposition Internationale des Arts et Techniques Appliqués à la Vie Moderne, 1937. Received Grand Prix de l'Art Féminin, Salon International de la Femme, Cannes, 1969; Grand Prix, Ville de Paris, 1973. Chevalier des Arts et Lettres, 1958; Officier, Légion d'Honneur, 1975. Died in Paris, 5 December 1979.

Selected Works

Examples of Delaunay's textiles and designs are in the Musée de l'Impression sur Etoffes, Mulhouse and the Centre de Documentation de Costume, Paris. Examples of her furniture are in the Musée des Arts Décoratifs, Paris and additional works including paintings and sculpture are in the Centre Georges Pompidou, and the Musée National d'Art Moderne, Paris.

Delftware

Delftware is the name given to a type of tin-glazed pottery produced in Holland from the early 16th century; the name derives from the Dutch town of Delft which became one of the most important centres for the production of this type of ware from the mid-17th century. The name is also sometimes applied to similar tin-glazed wares produced elsewhere in northern Europe, especially in England, where it is known as English Delftware.

Dutch tin-glazed pottery was derived directly from Italy. By 1512, or possibly earlier, the Italian potter Guido Andries had established a pottery workshop in Antwerp. Its productions consisted mainly of drug jars with simple geometric designs, tiles (good examples of which can be found at The Vyne, in Hampshire) and small altar vases. The colours were Italianate: blue, yellow, orange, green, but dominated by a very dark blue. Production of tin-glazed pottery quickly spread from Antwerp, particularly in the northern Netherlands, and soon established its own distinct style, subject matter and methods of production. This expansion was largely the result of the political and economic upheaval during the war between Spain and the Netherlands. The fall of Antwerp in 1585 led to a mass migration north and this undoubtedly included potters who were looking for a more favourable economic climate in which to work. Tin-glaze techniques were introduced to Middleburg in 1564 by one of Andries's sons, and the towns of Gouda, Rotterdam, Delft, Haarlem, Amsterdam and Frisa were all to become thriving centres for Delftware in the second half of the 16th century, producing both pottery and tiles.

The range of forms made in Delftware for domestic use was extensive. One of the features of the Delftware industry was its ability to respond to new tastes and fashions. It was quick to recognise the increasing demand for tablewares in the 17th century. The functional type of pottery known as *wit-goet*, or white wares, made in vast quantities, was derived from Italian models: simple jugs, fluted bowls, plates and other domestic pieces can often be seen depicted in contemporary paintings by artists such as Vermeer. These functional domestic wares were mostly undecorated, but glazed in an extra thick tin-glaze known as *dubblewit* (double white). The *Wapengoet* fulfilled a demand from the upper classes for fine quality heraldic ware featuring family coats of arms. Notable among the ornamental wares produced in Delftware were various flower vases, such as the *tulpiere*, specially made for displaying tulips, and gadrooned sunflower bowls, often with crudely painted borders of tulips and sunflowers.

Tiles are one of the most characteristic products of Delftware and were made in vast quantities. The political annexation of the Netherlands to Spain had brought the former into contact with a much wider use of tiles, and production of Delftware tiles and their use in interiors dramatically increased throughout the 17th century. They began to be used in entrance halls, passageways and staircases to a height of about one metre so as to protect clothing from white-washed walls. It was a small step from there to the tiling of kitchens, fireplaces and then entire rooms. It was during this period that very large tile paintings were used for walls. Compared to other forms of wall covering, such as wall-painting or tapestry, tile panels had the advantage of economy,

Delftware: panel of Dutch tiles with biblical scenes, made in Rotterdam, mid-18th century (such tiles were used in fireplaces in farmhouses); National Tile Museum, Otterlo, Netherlands

hygiene and bright lasting colour. Splendid flower panels are probably the best known of these.

Large quantities of tiles were exported to England, France, Spain, Portugal and South America. In England William and Mary ordered tiles and pots for the decoration of Hampton Court, and Delftware was also sent to France for the *Trianon de Porcelaine* where it created a vogue for blue and white ceramics. Architects of churches and palaces in Germany and Eastern Europe also commissioned large quantities of tiles from Holland. Tile-decorated rooms survive intact, notably in France at the *Château de Rambouillet* (1715–34), and at the *Amalienburg*, *Nymphenburg*, Munich (1734–39), both supplied by the De Ross factory (1666–1854) which dominated Delft tile production from the mid 18th century onwards. Collectively, production of Delftware was on a massive scale and, from the mid-17th through the 18th centuries Delft had probably the largest ceramics industry in Europe. It made fine, decorative ceramics available to many people and would have had an impact on most Dutch, and many other European, interiors in the homes of lower middle class people upwards.

Early in the 17th century many potteries began to abandon the hot maiolica colours for a blue and white scheme made fashionable by the vogue for Chinese porcelain, imported in quantity by the Dutch East India Company, founded in 1609. In 1615 there was a large auction of Chinese porcelain in Delft, and from this time onwards, Delftware potters all over the Netherlands began to imitate or integrate Chinese designs and subjects into their work. For example, *Wanli* borders of Buddhist symbols began to appear, juxtaposed with Dutch madonnas and baskets of fruit; soon Chinese figures, landscapes and flowers were imitated and the Chinese maze pattern became one of the standard corner motifs used on tiles.

However, although Chinese porcelain was of major importance stylistically, Dutch forms and subjects are nearly always clearly recognisable. Perhaps due to the influence of the Dutch Calvinists, who were opposed to any form of ornament, art in Holland became much more secular and realism dominated the

work of contemporary artists, such as Vermeer, de Hooch and van Ruisdael. This tradition is reflected in Dutch Delftware painting which was, compared to Italian maiolica, sparser in colour, less elaborate in design and typically based on subjects from everyday life: flowers, bowls of fruit, contemporary landscapes and scenes of rustic life. Many Delftware painters were also fine artists. Frederick van Frijt, for example, who decorated some of the finest plaques and plates, was also a highly respected landscape painter in his own right.

After about 1750 the high artistic standards and quality of craftsmanship which had characterised the previous century began to tail off, as Delftware faced increasing competition from German porcelain and English creamware. Some factories fell back on wares popular in the 17th century, others produced novelty wares, such as vases in the forms of fiddles, shoes or sledges, fussily decorated with landscapes in blue and white. By the 19th century only two tin-glazed earthenware factories survived in Delft. Dutch Delftware, however, had been extraordinarily successful in its ability to reflect the taste and needs of the day, with a high degree of elegance and craftsmanship. Production of traditional Delftware has continued to this day on a modest scale in Holland by factories such as Tichelaars at Makkum and De Porceleyne Fils at Delft.

De Morgan, William 1839–1917

British designer of ceramics and tiles

William De Morgan was arguably the most celebrated designer and manufacturer of ceramics and tiles associated with the Arts and Crafts Movement in the late 19th century. He trained first as a painter at the Royal Academy Schools but in 1861 he gave up this ambition and began to design stained glass. Two years later he met William Morris who commissioned De Morgan to provide designs for tiles as well as stained glass. Morris's tile designs were very simple diaper patterns mainly in blue and white, derived from medieval manuscript illumina-

De Morgan: panel of six tiles, 1880s

tions and engravings in old herbals. Technically, however, they were often imperfect and by c.1869 De Morgan was experimenting with tile production on his own. He was also becoming increasingly disillusioned by the overriding control that Morris exercised over the colours used in the production of De Morgan's stained glass designs. So, using the technical knowledge of J.T. Lyon, he began to manufacture his own glass. Production was short-lived largely due to a fire at his Fitzroy Square premises in 1872.

De Morgan was at heart an inventor with a basic knowledge of chemistry, and his interest was roused by the iridescence that appeared on his glass when the yellow stain of silver was overfired. This interest led to the rediscovery of lustre, a technique that had a long history dating back to 10th-century Iraq during the Abbasid period. It was also used in the Hispano Moresque wares of the early 14th century and Italian maiolica in the 15th and 16th centuries, but after this time it fell out of favour and by the 19th century it had all but disappeared. Basically lustre is a fine metallic deposit on the surface of a ceramic object brought about when a metallic oxide (silver, gold, copper) loses its oxygen (reduction) in the firing. De Morgan's early lustre tiles were mainly restricted to a coppery red but later he was able to produce tiles with two or three lustre colours – red gold, yellow gold, and pearly silver – on the same tile. The effect produced by the play of light

reflected on the uneven density of metal was little short of magical.

Concurrent with his experiments in lustre, De Morgan was designing and making tiles that showed a strong Morris influence. He had also taken over the production of a number of Morris's designs, initially using white blanks imported from Holland, and later, as his production techniques improved, tile blanks that he made himself. The influence of Morris on late 19th century design was, of course, enormous and his taste for the simplicity of medieval art and craftsmanship eventually influenced architecture, decoration, embroidery, and even music. De Morgan's interest in patterns derived from simple country flowers was clearly indebted to Morris's example but he also had a taste for fantasy and devised any number of fantastic animals and birds, as well as ships, sometimes as single tiles, and sometimes as repeat patterns with foliage or as pictorial panels. These latter tiles and panels were sold for framing, frequently in symmetrical pairs, or were incorporated into domestic fireplace surrounds. Tiles were also becoming increasingly popular in other areas of the domestic interior during this period and De Morgan's work was often used in bathroom dadoes, in entrance halls and in other locations where hygiene was considered important. The architect Halsey Ricardo, who was De Morgan's partner between 1888 and 1898, also made extensive use of tiles on the exterior of his house in Addison Road, not only because rain washed them clean but also because they retained their colour permanently. Another important use for De Morgan's tiles was in the interior decoration of ships, first the Tsar of Russia's private yacht, *Livadia* (launched 1880), and then ten liners for the Peninsular and Orient Steam Navigation Co. between 1882 and 1900. Some of the original drawings for these commissions and a number of duplicate panels have survived.

Many of the tile panels used in ships depicted stylised and fantastic views of some of the countries and ports that the P. & O. liners frequented. These views were not only intended as an expression of Imperial pride, they also reflected a broadening of the sources of inspiration available to designers in the late 19th century. The pattern books of Owen Jones, the artifacts gathered from all over the world and displayed at the great International Exhibitions from 1851, and the wider-buying policy of the South Kensington Museum, all encouraged a greater eclecticism in Victorian design. De Morgan was most interested in Islamic design. He had a thorough understanding of its principles and applied them frequently in his own work, particularly the ogee form which he used as a controlling construction in his designs. From c.1870 he was also experimenting with the deep cobalt, turquoise and olive green colours that were typical of Turkish and Persian glazes and which had never been used in Britain before. Théodore Deck in France and Cantagalli in Florence were involved in similar experiments and revived many of the same colours at around the same time. Unlike many other late 19th century ceramic manufacturers, however, De Morgan does not seem to have been interested in Japonisme, and equally he made no attempt to experiment with Spanish *cuenca* techniques even though certain of his clients and contemporaries – notably the architects Norman Shaw at Cragside, and G.E. Street at the American church in Rome – used them occasionally.

De Morgan's strength was as a designer of patterns for tiles.

The seemingly arbitrary way his patterns run over the shapes of his three-dimensional pottery offended later studio potters, but the idea of the unity of form and decoration was largely irrelevant to a 19th-century designer. The shapes of his thrown pots were designed on paper and much of his decorative work was executed on bought-in commercial wares. He employed a small permanent staff of four workers for the decoration of pots and dishes and some of the panels, but the tiles were decorated by a team of six girls. Often friends such as Halsey Ricardo and Dr. Thompson, were called in to help out or even to contribute the occasional design, but De Morgan did not allow his regular decorators to do any designing. The kilns were designed by De Morgan himself and drawings for many of these are in the Victoria and Albert Museum as are sketches for grinding mills and sieves and even roof trusses and a revolving grate. He also devised a system of gears for a bicycle. His knowledge of production was widely recognised; the Egyptian Government invited him to visit Egypt and to report on pottery production in 1893.

De Morgan tiles were never aimed at the mass-market. They were hand-crafted as opposed to factory-made and so inevitably they were expensive and were therefore always used in wealthy houses and often only in principal rooms. Cheaper versions were available for bedrooms and lesser areas. A plain 6 inch tile cost one shilling and threepence (6p) in 1887 compared with a similar product by Maw & Co. at fourpence (1.5p), and a decorated 6 inch tile was two shillings and sixpence (12.5p) compared with Maw & Co.'s version at sixpence halfpenny (2.5p).

By 1907 De Morgan had decided to give up pottery. He had already embarked upon a new career with the publication in 1906, at the age of 67, of the first of seven immensely popular novels. By this time too, his designs already appeared old-fashioned and sales had declined. Apart from his writing, he and his wife, the painter Evelyn Pickering, devoted much time to the support of the Suffragette movement and De Morgan was an ardent pacifist. In view of this it is sadly ironic that his death in 1917 should have been caused by a bout of trench fever which he caught from a friend who was visiting him on leave from France.

Biography

William Frend De Morgan. Born in London, 16 November 1839; the son of the mathematician Augustus De Morgan. Studied art at the Royal Academy Schools, London, 1859. Married the painter Evelyn Pickering in 1888. Designs for stained glass and tiles from c.1863; worked for Morris & Co., 1863–72; established own pottery business in Cheyne Row, Chelsea, 1871; moved to Merton Abbey, Surrey, 1882; new factory at Sands End Pottery, Fulham, 1888. In partnership with the architect Halsey Ricardo, 1888–98; new partnership with Charles and Fred Passenger and Frank Iles, 1888–1907. Retired as a potter, 1905; Fulham factory closed, 1907; business continued under the Passengers and Iles until 1911. From 1906 pursued a successful career as a novelist. Died 15 January 1917.

Selected Works

The largest collection of De Morgan's designs is in the Victoria and Albert Museum which has more than 1200 sheets of original drawings; many of these are for dishes, pots and other decorative objects

but at least 800 are for tile patterns and tile panels. Another 91 tracings and a sketchbook are in the Museum and Art Gallery, Birmingham. These museums also hold collections of De Morgan's ceramics and tiles. Other collections of De Morgan's work are housed at Old Battersea House, London; Fitzwilliam Museum, Cambridge; Leighton House, London; and William Morris Gallery, Walthamstow. Examples of De Morgan's tiles, employed in fireplaces or as small panels, were used in many Aesthetic and Arts and Crafts interiors.

Interiors

- c.1879 Leighton House, Holland Park Road, Kensington (tiles for the hall, stairway and Arab Hall); Frederic Leighton
- 1882–1900 Tiles for the interiors of 10 liners built for the Peninsular & Orient Steam Navigation Company
- 1888 1 Holland Park, London (tiled porch and fireplace tiles): Alecco Ionides
- 1904 8 Addison Road, London (tiles for the exterior, fireplaces and interior): Sir Ernest Debenham

Stained glass, tiles and painted furniture for Morris & Co., 1863–72.

Design Reform Movement

Design reform has been a continuing theme throughout the history of design in most parts of Europe since the Industrial Revolution. The design reform movement in Britain came about as a reaction to a general fear that industrialisation had led to a lowering of aesthetic standards, since the preoccupations of the craftsman had little to do with the demands of industrial production. In addition to any cultural damage that might ensue from lower standards, it was feared that they would weaken Britain's position in world trade. Hence the arguments put forward by early design reformers, while motivated by a spiritual and moral concern for the development of industrial culture, often also cited the excellence of continental

education and industrial practice as compared with that in Britain, and the commercial ramifications of this situation. Reformers perceived a two-fold problem: first, in the education of designers, which was either non-existent or wholly inappropriate; and second, in the low expectations of the producer and consumer. The tactics they adopted were therefore geared towards the reform of design education, and also the education of public taste.

The earliest recognition of the importance of design in industry came not from Britain, surprisingly, perhaps, given her pre-eminent position in world trade during the mid-19th century, but from Continental Europe. As early as 1725, for instance, the reorganisation of the Academy of Art in Vienna made specific reference to the need to promote the country's products abroad, and the same principle informed Friedrich Anton Freiherr von Heinitz's (1725–1802) reform of the Berlin academy in 1790; its manifesto stated that its intention was "to contribute to the well-being of the arts in general as well as to instigate and foster home industries, and by influencing manufacture and commerce, improve them to such an extent that the taste of Prussian artists will no longer be inferior to that of foreigners" (Pevsner, 1940). The end of the Napoleonic wars, and the rapid increase in trade across Europe in the early 19th century as a consequence, accelerated the shift away from territorial struggles between nations towards commercial rivalry, and served to heighten concerns about national competitive advantage.

The concept of the artist in industry was therefore not a new one when, in 1835, William Ewart (1798–1839), Member of Parliament for Liverpool, established a Select Committee "to enquire into the best means of extending a knowledge of the arts and principles of design among the people (especially the manufacturing population) of the country; also to enquire into the constitution of the Royal Academy and the effects of institutions connected with the Arts" (Bell, 1963). Ewart's ideas were strongly influenced by those of Benjamin Robert Haydon (1786–1846), a painter who had campaigned throughout the late 1820s and 1830s for the establishment of a school of design. It was the Select Committee of 1835 which gave rise to the first such institution. This school had in fact begun to be set up before the committee even published its recommendations, in August 1836. Its council was drawn entirely from members of the Royal Academy, which previously had viewed the reformers' campaign with some distrust, and so the new school had a rather compromised status from its very inception. In its early years it was beset by argument and criticism, and its first director, John Buonarotti Papworth (1775–1847), lasted just 18 months in the post.

Papworth's replacement at the School of Design, William Dyce (1806–64), was to have a far greater impact on design reform in Britain. Dyce was a shrewd campaigner, who was able to invoke the now familiar commercial argument for design training, although it is clear that his motivations were at least as much aesthetic and spiritual. He had worked in Rome, where he had been impressed by the group of German painters known as the Nazarenes. The Nazarenes had become disillusioned with the academic approach to art education promoted at the Vienna Academy, and had established a commune in a deserted Italian monastery. Their austere outlook and stress on objective drawing from life influenced Dyce. In 1837 he was

appointed to the Edinburgh Trustees' Academy, and undertook a study tour of schools in France and Germany on behalf of the Council of the London School of Design, during which he developed his views on both the need for a new system for training designers in Britain, and the basis of the curriculum that they should follow. He wrote: "the studies of an elementary school must be undergone by pupils who are to become designers for industry; and in the present state of things it may be asked, where are the means of engaging in these studies to be found? Why, nowhere. There is at present no elementary school suited to the wants of a designer for industry" (Dyce, 1853). More than most reformers, Dyce also had a subtle understanding of the need not only for good design education, but also for industry to recognise the value of design: "It may appear incredible, but I assert it without fear of contradiction, that there are very few if any instances in Great Britain, of industrial artists who are employed as responsible persons; that is, to whose judgment manufacturers give the least deference; whose productions can be looked upon as original works; or who are allowed even to have a voice as to the mode in which the patterns they are employed to make should be executed" (Dyce, 1853).

It was Dyce's cogent argument that encouraged the Government to invest in and expand the School of Design. By the time he left the School of Design in 1843, there were six regional branch schools, and a Normal School – a school for teacher training – had been established within the London school.

The single most important figure in design reform in Britain in the mid 19th century was Henry Cole (1808–82). It was Cole who was most successful in mobilising public opinion and the establishment, using three key channels: publications, exhibitions and museums, and the design schools. Although Cole was a highly influential figure, and worked closely with Prince Albert in the latter's capacity as the President of the Royal Society of Arts, he realised that, in order to succeed, design reform had to filter down through all levels of society. It was largely due to Cole's efforts that the design reform movement broadened its horizons and took on Dyce's implicit understanding that design could not exist in a vacuum; the demand for good design had itself to be cultivated, both among manufacturers, and among the buying public.

As a result of his tireless campaigning, Cole was asked in 1848 to make a report on the Schools of Design. His conclusion was that no-one had responsibility for the schools, and that they had lost direction. Cole himself became chairman of the Schools of Design in 1851 and subsequently, in 1852, Secretary of the new Department of Practical Art. During the same period he published an influential magazine, the *Journal of Design*, which carried articles by sympathisers such as Dyce and Owen Jones (1809–74). Cole was an energetic and versatile campaigner who could turn his hand to a wide range of enterprises as the need arose. He was involved to varying degrees in design, manufacturing, publishing, and organising exhibitions, specifically the 1851 Exhibition, which marked a turning point in the development of industrial design as a professional discipline in Britain. The Great Exhibition, although a commercial success, underlined the bankruptcy of industrial art to reformers; it was dominated by the naturalism and eclecticism that they despised. However, even for Cole,

some of the exhibits were worthy examples of industrial design, and a selection was bought with the profits of the exhibition, to be housed in a Museum of Manufactures. This collection formed the nucleus of the collection established in South Kensington in 1852, that was renamed the Victoria and Albert Museum in 1899, and that was the inspiration for similar museums in continental Europe, notably Paris, Stuttgart and Vienna.

Another strident critic of the uncontrolled application of ornament and decoration to industrial products was the painter and designer, Richard Redgrave (1804–88), who lectured at the School of Design from 1846 onwards. Between 1849 and 1852, Redgrave edited the six editions of Cole's *Journal of Design*, and through its pages helped develop the principles of a new industrial aesthetic. Redgrave inherited the Dyce concept of studying nature and making abstractions based on the principles of geometry, and of using these abstractions, rather than historicist motifs, to create designs for industry. He was not concerned with craftsmanship, but with reproducibility, and saw the skill of the designer as residing in his ability to select and arrange materials, rather than technical virtuosity.

As with many campaigning movements, the aims of the design reformers are easier to describe in the negative than in the positive; that is to say, they described and ridiculed the many examples of what they saw as debased and vulgar design far more often than they upheld examples of good and proper design. Many of their ideas are manifest, however, in the work of A.W.N. Pugin (1812–52), a fervent critic of eclecticism and a devout Catholic who took his lead from Gothic architecture. Pugin's *bêtes noires* were *trompe-l'oeil* and other forms of pretence or artifice, such as veneered mahogany. His work on the Medieval Court at the Great Exhibition was praised by the design reformers, although the stridency of his views – expressed in his books, including *The True Principles of Pointed or Christian Architecture* (1841) – meant that he was often marginalised both as a designer and as a theorist.

This raises the question of how strong an impact the design reform movement actually had on manufacturing and design. In the short term, the teachings of Redgrave and the design orthodoxy preached by the South Kensington Schools certainly encouraged the more progressive sections of the wallpaper and textile industries, in particular, to abandon overtly naturalistic effects in favour of simpler, conventionalised designs, and from the mid-1850s stylised floral and diaper patterns proliferated at the more expensive end of the market. Similarly, the influence of Pugin and Owen Jones helped to inspire a fashion – albeit shortlived – for authentic Gothic and Moorish designs which went some way towards weakening the stranglehold of foreign, historicist styles. Yet, despite the emphasis on machine production, the majority of designers involved in the movement for design reform were still producing expensive, hand-crafted work and their influence was therefore quite limited. And, large sections of the public proved quite resistant to the aesthetic of simplicity and conventionalisation and continued to purchase furnishings and decorations that were richly endowed with meretricious carving and ornament. Indeed, it was not until the last quarter of the 19th century, when a second generation of architects and designers such as Bruce Talbert, Christopher Dresser, and Lewis Foreman Day

produced more popular forms of reformed Gothic and Anglo-Japanese design, that the principles of design reform began to enter the commercial sphere and even then the appeal of such work was generally restricted to upper-middle-class, progressive tastes.

Meanwhile, design reformers in Britain frequently cited the superiority of either continental design education, or of the manufactured products themselves, as an argument for action. Ironically, many of the foreign governments were facing the same problems and proposing similar solutions. Britain's economic power and naval dominance had clearly given rise to complacency in the first half of the 19th century, and the sheer capacity of its manufacturing industry led some French economists in the 1820s to argue that France should not attempt to compete with Britain in output, but to maintain its superiority in terms of design and craftsmanship. Many British manufacturers simply bought or copied their designs from France; and Dyce asserted that "Every one admits, that the great evidence, which we find in France, of the cheaper kinds of manufacture, is due to the ample opportunities of study provided for the common people" (Dyce, 1853).

Germany too was increasingly active in international competition, and gradually became the focus of anxiety among design reformers and industrialists in both France and Britain, who each sent numerous committees to examine the provision for education of artists in industry. A British committee visiting southern Germany in 1896 found that "numbers of illustrated books, besides large quantities of almanacs and Christmas cards, intended for the English-speaking markets, are printed, and the success of this industry is no doubt largely due to the [...] ready supply of well-trained artistic operatives" (HMSO 1896).

Design reform has continued to resurface as a theme in Britain and across Europe during the 20th century. On an aesthetic level, the rise of Functionalism after World War I and its dominance in the avant-garde of design theory through to the 1960s vindicated the reformers in their desire to find an aesthetic appropriate to the age of mass production. On a more prosaic level, however, industrial design as a professional discipline has had a rather more ambivalent response from industrialists and the general public alike.

Some of the initiatives promoted by Dyce, Cole and the other design reformers developed into highly influential establishments themselves, notably the Victoria and Albert museum and the Royal College of Art, which emerged from the School of Design, and have ironically come under fire from latter day reformers who would like to see more dynamic agents for change. Many of the arguments put forward for good design in industry and investment in design education in the intervening period have strong echoes of the design reform debate, which begs the question whether any real progress has been made in the last century and a half. Quite clearly, however, the debate has had a profound effect on the manufactured environment, and it seems that the economic and cultural arguments for good design and design training will continue to be rehearsed as long as the context in which they operate continues to evolve.

Deskey, Donald 1894–1989

American interior, furniture, product and packaging designer

Although originally trained in the United States, Donald Deskey was much influenced by his time in Paris where he studied in the early 1920s, thus experiencing directly many facets of contemporary European design and fine arts practice. Of considerable influence for him, as for a number of designers in 1920s America, was the famous 1925 Exposition Internationale des Arts Décoratifs et Industriels Modernes, held in Paris, which did much to popularize the Art Deco style. It provided an important stimulus for Deskey's lavish interior decorative schemes for Radio City Music Hall (completed 1932) in the Rockefeller Center, New York City. Although such luxurious designs have been portrayed subsequently by many historians as the high point of his career, it is important

to remember that Deskey also did much to promote in America something of the more austere and functionalist aesthetic of the avant-garde European Modernists whose work he had also encountered. Indeed, he had visited the Bauhaus in Germany and was a keen admirer of the work of artists and designers associated with De Stijl in Holland. However, his designs may perhaps best be summarised as exhibiting traits of both European decorative and functionalist tendencies, blended with the symbolism of progress evidenced in the forms and features of the American streamlined aesthetic of the 1930s.

Deskey's interest in French design was paralleled by the mounting in the United States of a touring exhibition of a selection of designs from the 1925 Exposition, commencing at the Metropolitan Museum, New York, in 1926. This decorative aesthetic soon became a fashionable style, bolstered in 1928 by two major department store exhibitions, at Macy's and Lord and Taylor's in New York. Like a number of other American designers who came to prominence in the later 1920s, Deskey was involved in the window display of fashionable stores; as the profits of these stores dropped in the recessionary years, designers were brought in to stimulate flagging sales. For the Saks Fifth Avenue store Deskey made dramatic use of cork and metal as a backdrop for the display of fashionable merchandise (1926–27); for the Franklin Simon store he introduced corrugated and galvanized iron, copper and brass as a setting for the sale of goods. This exploration of the fresh aesthetic possibilities of contrasting materials came to typify much of his interior design work of the later 1920s and 1930s. Apart from the use of chromium-plated metal in furniture and fixtures design, he also used plastics which, as he stated in an article in *Modern Plastics* in December 1934, had a practical as well as aesthetic role, being impervious to the damaging effects that might be wrought by the alcoholic cocktails of the Prohibition era. He also explored the decorative and expressive potential of glass in both architecture and furniture; in the former he deployed glass bricks to provide interesting effects in indirect lighting and in the latter glass was used to emphasise the possibilities of transparency and structure.

Building on the early critical success of his designs for hand-painted decorative screens and lighting, he undertook commissions for the interiors of apartments belonging to a number of prominent and influential New Yorkers. Perhaps unsurprisingly, given his earlier window display commissions, these included that of Adam Gimbel, President of Saks. Gimbel's apartment (1927) boasted cork walls, a copper ceiling, linoleum floor, pigskin chairs, a living room which explored the decorative possibilities of aluminium, and a hall which made imaginative use of stainless steel and vitrolite. Other celebrated New York clients included Abby Aldrich Rockefeller, for whom Deskey designed a private print gallery and boudoir in her West 54th Street residence (1929–31). With its clean, austere forms and sense of spatial clarity this was much more in tune with the progressive Modern Movement tendencies of the European avant-garde. More typical of his work as a whole, and inclining more towards the streamlined Modernism of a number of his American contemporaries, was his design for the apartment of George and Eleanor Rand (1930).

He also exhibited his work at the influential American Designers' Gallery in which he played a prominent role, as he did in the American Union of Decorative Artists and

Deskey: Radio City Music Hall, New York, 1931-32

Craftsmen (AUDAC). Like their counterpart, Contempora Inc., these two organisations were established in the later 1920s in order to promote modern decorative arts and design in the United States, much along the lines of European groups such as the Wiener Werkstätten and the Werkbunds in Austria and Germany or the Société des Artistes Décorateurs in France. Although the activities of such American propagandist organisations were seriously curtailed by the Wall Street Crash of 1929 they did much to foster a new climate for modern design in the United States in the years leading up to World War II.

At Radio City Music Hall (1931–32), part of the Rockefeller Center in New York, Deskey sought to promote American modernism, commissioning a number of renowned sculptors and painters to provide a rich decorative ambience in one of the most lavish interior schemes of the 1930s. Having won the limited competition for the project, he collaborated with many fellow members of AUDAC in the design of the foyer, auditorium, smoking and powder rooms and other public spaces. He himself contributed designs for some of the wallpapers and coverings (including a design based on tobacco-oriented motifs, printed on aluminium foil, loosely drawing on Cubist motifs), carpets, furniture and lighting designs. As well as bakelite and aluminium in the furniture, he also made extensive use of mirrors and glass fittings as a means of creating a sense of spaciousness. Of considerable significance for the establishment of Deskey's subsequent reputation were his designs for Samuel L. "Roxy" Rothafel's apartment, also in the Radio City Music Hall complex. ("Roxy" was the impresario of stage and radio shows who was the driving force behind Radio City Music Hall.) The interiors were imbued with a distinctly Moderne flavour in their exploration of the decorative possibilities of aluminium, bakelite, glass, cherry wood panelling, lacquer, and even gold-leafed ceilings which hinted at memories of the French artistes-décorateurs of the 1920s.

Deskey also featured significantly in designs for the New York World's Fair of 1939–40, designing the Focal Exhibits for the Communications and Transportations Zones. Both incorporated multimedia presentations and revealed the levels of sophistication which were expected of professional designers by the late 1930s. At the same exhibition he was also commissioned to produce interiors for the House of Jewels, one of the most popular exhibits at the Fair, as well as interiors for the Maison Coty Pavilion which were strikingly reminiscent of contemporary film sets. By this time Deskey's design practice clearly embraced a wide range of commissions in various design media, reflecting the growing professional status of, and demands made on, industrial designers in the United States.

After World War II Deskey's designs were in tune with the corporate ethos of the International Style and among the commissions he worked on were packaging designs for Proctor and Gamble (1949–76), packaging and interiors for Johnson and Johnson (1959) and Wall Street Club interiors on Chase Manhattan Plaza, New York (1960–62). This reflected a move away from artistic personality to all-but-anonymous design professional which, with a number of notable exceptions, became common practice in the post-war years.

Biography

Born in Blue Earth Minnesota, 23 November 1894. Studied architecture at the University of California, Berkeley, 1915–17; studied painting, Art Institute of Chicago, 1918–19; California School of Fine Arts, San Francisco, 1919–20; Ecole de la Grande Chaumière, Académie Colarossi, and Atelier Leger, all Paris, 1920–22. Served in the United States Army 1917–18. Worked as a graphic designer and co-founder, with Charles Howell, of an advertising agency, New York, 1921. Lived in Paris, 1921–22 and 1925–26. Married 1) Mary Campbell Douthett, 1923 (divorced 1946); 2 sons; 2) Katharine Godfrey Brennan, 1952. Returned to America and active as a designer of interiors, furniture, textiles, light fittings and glassware from 1927. Established his own design company with Philip Vollmer, Deskey-Vollmer Inc., New York, 1927; partnership dissolved c.1931; in private practice from 1931; formed Donald Deskey Associates, c.1943; branches in London, Brussels, Milan, Copenhagen, and Stockholm by 1950; retired as President, 1976. Instructor in art, Juniata College, Huntingdon, Pennsylvania, 1923–25; Professor of Industrial Design, New York University, 1930–36; lecturer, Massachusetts Institute of Technology, Harvard University, and other universities. Work displayed at many exhibitions including the Chicago Century of Progress, 1933; Exposition Internationale des Arts et Techniques Appliqués à la Vie Moderne, Paris, 1937; and World's Fair, New York, 1939. Co-founder and Fellow, American Society of Interior Designers; Member, American Architectural League, and Royal Society of Art. Died in Vero Beach, Florida, 29 April 1989.

Selected Works

The Donald Deskey Collection, containing numerous drawings, company records and brochures, manufacturers' catalogues, correspondence and photographs, is in the Cooper-Hewitt Museum, New York. Examples of Deskey's furnishings are in the Metropolitan Museum of Art and the Cooper-Hewitt Museum, both New York, and Yale University Art Gallery, New Haven.

Interiors

- 1926–27 Display windows, Fifth Avenue, New York: Saks and Company
- 1927 Adam Gimbel apartment, Park Avenue, New York (interiors and furniture)
- 1929–31 Abby Aldrich Rockefeller apartment, West 54th Street, New York (interiors including picture gallery, ceramics room, print room, dressing room and bathroom)
- 1930 Helena Rubenstein apartment, Fifth Avenue, New York (interiors including drawing room, bedrooms, and dressing rooms)
- 1931–32 Radio City Music Hall, Rockefeller Center, New York (interiors and furnishings): Samuel L. (Roxy) Rothafel
- 1932 Roxy apartment, Radio City Music Hall, Rockefeller Center, New York (interiors and furnishings): Samuel L. (Roxy) Rothafel
- 1933–35 Richard H. Mandel house, Mount Kisco, New York (building and interiors with Edward Durell Stone)
- 1934 Eleanor Hutton Rand apartment, Washington Mews, New York (interiors and furnishings)
- 1937 Hollywood Turf Club, Inglewood, California (interiors): Harold Anderson
- 1948 S. S. *Argentina* (interiors of ship's staterooms and public areas): Moore-McCormack Lines
- 1959–60 Marco Polo Club, Waldorf-Astoria Hotel, New York (interiors and furnishings)

Desks

Although known in Ancient Egypt and China, the desk in this period was merely a writing slab supported upon the knees. The earliest desks, in the sense of a supported surface, appear in Byzantium. They were little more than table tops fitted with a chest-like lower part and a lectern above, which could be angled to suit the writer. Clearly, the common use for desks at this time was in religious establishments where illuminated manuscripts were prepared, but the term "desk" originated in the Middle Ages and has since been applied to a range of writing and reading furniture such as lecterns, bureaux and secretaires.

While social conditions limited the spread of education and the growth of large numbers of written documents, the need for a private desk was limited. In the Middle Ages shallow boxes with sloping lids were used. These were known as scriptorie and remained the norm well into the post-medieval period.

By the 16th century, the notion of a portable table desk was developed. These were often elaborately decorated as they may well have been part of the furnishings of cabinets of curiosity. Inventories of Charles I's property include a "faire deske richly embroydered with silver and silk wherin is a silver inke pott and sand box".

The development of desks from writing boxes followed two paths. One was based on the fall-front *vargueño* (*escritorio*),

an early form of the fall-front desk that was to become popular all over Europe. The *vargueño*-inspired desk inevitably followed the prevailing decorating fashions through a long history. In the late 17th century these fall-front cabinets, sometimes known as *escritoirs*, were very fashionable, having a range of drawers and pigeon holes arranged around a central cupboard. Examples exist in marquetry and lacquer, but they eventually tended to decline in favour of bureau cabinets. By the mid 18th century the *secretaire à abattant*, a cabinet-like piece which has a vertical fall-front for writing upon, found great success as a design in France. These vary widely in finish, but usually have a fitted section behind the desk flap and a cupboard below, often a marble slab is fitted to the top. During the Louis XVI period this form of desk was made in a smaller, more delicate shape, with the desk cabinet fitted onto legs or an open stand and used as a framework for luxurious decoration.

The form was adapted to the tastes of Empire and Biedermeier during the early 19th century and revivals of the 18th century models were also made in the mid to late 19th century. The modern wall unit having a rectangular cabinet with a drop flap is the distant relative of one of the most inspired desk designs.

The second path was based on the angled front slope of writing boxes. Initially these were mounted on stands: subsequently the whole desk was mounted on a chest of drawers or on a stand to create a bureau desk. The imaginative reversal of the lid hinging was designed to allow the lid to drop down onto lopers to form a writing surface. The developments from this type were numerous versions of bureaux, which although providing writing space, are really a different category of furniture.

A third development was based on the adaptation of a table to create a variety of desk forms that, like the ones above, are still used today. The growth of polite society, a more literate public and better communication systems, encouraged writing which required new furniture forms. The initial development was based on the plan of two pedestals (usually with drawers) surmounted with a table top. Hence storage and writing were both catered for. The so-called *bureau Mazarin* was one of the first of these forms, being popular at the end of the 17th century, both for its practical use and also as an opportunity for luxurious decoration. In contrast to the Mazarin desk was the *bureau plat*, a flat writing table with drawers in the frieze. These again presented an opportunity for luxurious finishes; some of the most illustrious were made by Charles Cressent. This form was sometimes combined with a *cartonnier*, an extension which could be used as a matching filing cabinet.

This latter form was popular in France throughout the 18th century. In England and America the writing bureau (often in combination with a top cabinet) remained popular as did a range of table bureaux or portable desks.

The pedestal desk was also developed either into a library desk or a kneehole desk. The kneehole desk was often on a small scale and was ideal for private apartments and boudoirs, whereas, due to the development of libraries in private houses, the library desk became an important symbol of wealth and taste. Indeed most of the well-known cabinet-makers of the 18th century produced fine examples. Chippendale made a superb mahogany library desk for Nostell Priory and published

Desks: library table by Thomas Sheraton, 1793

a design for a quite exotic writing desk-table in the *Director* of 1762. John Channon is credited with making perhaps the most extravagant library tables which are fitted with superb mounts and ingenious construction methods. The pedestal desk form remains popular today, made in a variety of sizes suited to differing situations.

In France, a taste developed for delicate writing desks such as the *secretaire en pente*, a free-standing table with a flap used as a lid when closed and a writing surface when open. The *bonheur du jour*, a term first encountered in the 1770s, refers to a small writing table with a shallow superstructure of shelves or pigeon holes, especially designed for ladies' use. Sheraton's Harlequin desk table is somewhat similar, although his example has a hidden superstructure that rises when required.

Towards the end of the 18th century the fascination with mechanics and furniture found fertile ground in desk design. A simple example might be the *Secrétaire à la bourgogne*, a French mechanical desk with one part rising to reveal a range of small drawers while the other part hinged forward as a writing surface. However, it was the work of David Roentgen and Jean-François Oeben that was to produce some of the most spectacular mechanical desks of the period. The famous Bureau du Roi, made for Louis XV, took advantage of the new cylinder top as well as a number of ingenious secret mechanical devices to become one of the world's most famous pieces of furniture.

In the same vein were a range of desks that incorporated the solid cylinder front, or a tambour. The *bureaux à cylindre* were designed so that as the writing slide was pulled forward, so the cylinder front would roll back revealing the desk interior. This was a fine example of the most skilful cabinet-making.

Sheraton devised cylinder desk / bookcases, some of which

were intended for the use of two persons and demonstrated something of the desire for ingenuity that his Harlequin design had done previously. In the same vein were the mechanical desks devised by Giovanni Socchi c.1810 in which a compact oval table converted into a desk and chair.

In the late 18th century a distinctive desk form was developed and named after Carlton House. The design usually follows an elegant library table base with drawers in its frieze, which is surmounted with a gallery of smaller drawers or pigeon holes. It has an instantly recognisable D-shaped profile.

During the 19th century a range of adaptations and copies were made of earlier desk models, but there were a number of innovations as well. The well-known Davenport compact desk is one such example. These were made in the full range of Victorian materials and finishes. It was also during this period that the requirements of business produced a demand for office desks rather more substantial than the simple clerk's desk which was still recognisable as a derivative of the medieval table desk. The market was particularly strong in the United States and the products of the W.S. Wooton Patent Desk Company helped many businesses organise themselves efficiently. The Wooton desk was among the first to incorporate a variety of features related to filing, storage, and security; its swing-out front sections were adapted subsequently in British models as well as in the 20th century "home office".

Wooton's desks were exported, along with their less exotic partners, the rolling-top office desk. This desk, a feature of many Sheriff's offices in the Wild West, soon became popular in European business houses.

The 20th century has witnessed an amazing development in all forms of furniture, including desks. In the early part of the century, while Frank Lloyd Wright was developing metal desks with integral chairs for the Larkin building, the Arts and Crafts movements were using traditional shapes to experiment with their particular design and decoration. For example, desks by Koloman Moser and C.R. Ashbee are different in design but often have the same basic form.

The Art Nouveau and Art Deco movements influenced shape and decoration dramatically, but the basic function of the pedestal or table desk remained unchanged. In the same way the Modern Movement influenced styling and choice of materials, for example, the tubular-framed desk, but the shapes often remained the same. This is not surprising, as desks are essentially work-stations and as such must ultimately remain suited to the human form.

De Stijl

The Dutch artists' group and journal known as "De Stijl" was founded in Leiden by Theo van Doesburg in 1917. Strongly influenced by the paintings of Piet Mondrian, much of the work produced by the group relied on flat, geometric areas of primary colours arranged within a matrix. This approach was applied to architecture, furniture, textiles, graphics and other media. And De Stijl interiors were similarly characterised by flat areas of colour applied directly to the walls to produce a visual effect on the architectural space. They contained comparatively little furniture which was arranged in a linear pattern in this space-colour composition. The principles of this use of colour and the effect achieved ultimately varied from artist to artist. The fact the De Stijl group was made up of painters and architects was the principal reason for a dualistic approach to interiors.

Moreover, interiors were not initially a specific theme for the members of the group. The articles in the periodical *De Stijl* (1917-31) deal mainly with the relationship between painting and architecture, and the interior is mentioned only in passing. For this reason the attention to furniture and other interior components which help define interior design is a neglected aspect of the De Stijl interior. The well-known exceptions to this rule are the interiors of the furniture designer / architect Gerrit Rietveld.

Some De Stijl members were more preoccupied, at both a theoretical and practical level, with interiors than others. Those with the most clearly defined vision of the interior which was proclaimed in word and deed, are the painters Theo van Doesburg and Vilmos Huszár, and Rietveld. The painter Bart van der Leek was of great importance in the first steps towards a symbiosis of painting and architecture, though for him, Mondrian and the architects Robert van t'Hoff, J.J.P. Oud and Jan Wils, interiors were a topic with which they were only indirectly involved in the 1920s. Beside the official De Stijl members there were architects both at home and abroad who worked in the same style. Sometimes these were imitators, like P.J.C. Klaarhamer, S. van Ravesteyn, Félix Del Marle and Robert Mallet-Stevens, but in a few cases, such as in the work of Piet Zwart and El Lissitzky, their contributions had a fruitful impact on the formation of the De Stijl interior.

The development of the De Stijl interior spans roughly the period 1917-1928, from the setting up of the magazine to the year in which the last issues appeared. The personal positions of most members were subject to constant change. There is a clear watershed in 1921-23 when individual visions changed and the communal endeavour became dominant. In those years Oud broke with Van Doesburg and *De Stijl* because he could not agree with the painterly attitude which wanted to dis-

De Stijl: Aubette cafe and cinema by Theo van Doesburg, Strasbourg, 1927-28

mantle the structure of architecture by means of painting. At the end of the 1920s the design of interiors was very much determined by the New Architecture (*het Nieuwe Bouwen*), which forced the influence of Neo-plasticism (*de Nieuwe Beelding*) into the background.

The concern of De Stijl painters with the interior and their consequent collaboration with architects issued from their joint desire to unite various disciplines under the umbrella of architecture. In this they were extending the tradition of the 19th-century ideal of communal art which had been propagated in the Netherlands by the architect H.P. Berlage. The desire for collaboration and the attempt to gain a place for painting which was incorporated in, rather than separate from social life, was one of the main sources of this ideal. Besides this there was an inspirational impulse to reform life through redesigning the living environment, giving preference to the universal and collective over the arbitrary and individual. Use of abstract painting, harmony through the union of opposites, the destruction of architectural construction by means of painting, technical achievements and standardisation would on the one hand avoid echoes of the past and actually introduce the new life, and on the other and make the "well-planned" interior an off-the-peg product accessible to all.

During his De Stijl period Rietveld did not formulate any theoretical background for his work. However, his furniture designs already expressed a design ideology which did not restrict itself to designing an object but broadened into a general view of space and an ideological social position. Through the design and construction of furniture Rietveld tried to make a link with the space in which it was set. In addition his designs reflect a predilection for mechanisation and standardisation intended to make the furniture more affordable. Gradually his view of space developed towards interior design. In his approach to architecture the interior was more a starting point than a result. He wanted to make people aware of the notion of space, not as the content of a shape, but as a part of the overall space. The design of the furniture, which he had incidentally produced before joining De Stijl and which

visually occupied and enclosed no space, also fitted in with that view. It is apparent from his work that he was not opposed to the use of colour in interiors, but his solo activity indicates that he was certainly not over-eager for a painter to become involved. This does not detract from the fact that in the first half of the 1920s he was heavily influenced by the De Stijl painters in his choice of colours. The colour reduction which van der Leek had arrived at in his work as a result of his process of abstraction, was adopted by Rietveld; despite the fact that in his interiors he was never converted to the exclusion on principle of other than primary colours.

In 1922 van Doesburg met the architect Cornelis van Eesteren, with whom he worked intensively the following year on the design of the *Hôtel Particulier* (a residence for the Paris gallery owner Léonce Rosenberg) and two other architectural designs, *Maison Particulière* and *Maison d'Artiste*. The experiments with Van Eesteren bear witness to a changed view of the use of colour in architecture. Separate blocks of colour give way to a use of colour which focused on the surfaces and volumes of the architecture and which sought to highlight them.

In 1924 van Doesburg published the article "Towards a Neoplasticism" in *De Stijl*, on the subject of modern architecture. Its content was undoubtedly inspired by his architectural experiments with van Eesteren. Simultaneously van Doesburg's speculations were realised by Rietveld in the house which he designed for Truus Schröder-Schröder in Utrecht. The ground plan of the first floor of the Rietveld Schröder House (1924) is completely open. This area contained the living space. The dividing walls are movable, making the space multi-functional and a large part of the furniture is built-in. The walls are coloured, making wallcoverings unnecessary. Ornaments and decorative items have been avoided in order to show the essence of the architecture (space) to maximum effect. The interior is light because of the daylight which floods in through the many large glass surfaces. However, this interior is more a reflection of an attitude to life in which awareness, sobriety, efficiency and economy are central, than a product of monumental art.

The first issue of *De Stijl* in 1928 was called the Aubette issue. It was devoted entirely to the conversion of the 18th century Aubette building in Strasbourg as an entertainment venue, which was supervised by van Doesburg. Unlike earlier examples of De Stijl interiors, the internal walls and parts of the walls are treated as separate contrasting vehicles of the compositions, with the structure of the architecture being followed rather than dismantled.

Although fruitful results were initially achieved in joint projects by van Doesburg, Oud and Wils, and Huszár, Wils and Zwart, demarcation was the rock on which the ideal of collaboration foundered. This did not mean that there was no belief in the role of painting in architecture. However, the moment the notion of the art of painting was abandoned and interpreted more widely as colour compositions in architecture, new potential uses for the future seemed to emerge. Nor was it any longer the painter who by definition determined the colour scheme or conversely the architect who was the sole purveyor of architecture focused on painting. As van Doesburg had defined it in *De Stijl* in 1924, in a joint article with van

Eesteren, "Vers une construction collective", it must be the work of "the constructor of the new life".

Selected Works

Examples of furniture by Pieter Klaarhamer and Piet Zwart are in the Gemeentemuseum, The Hague; the largest collections of furniture by Gerrit Rietveld are in the Stedelijk Museum, Amsterdam and the Centraal Museum, Utrecht. Numerous designs, photographs and documentation relating to the work of Theo van Doesburg are in the van Doesburg Archive, part of the collection of the Rijksdienst Beeldende Kunst, The Hague. Additional archive photographs and documentation relating to the De Stijl group are in the Nederlands Architectuurinstituut, Rotterdam.

- 1917-18 Bruynzeel House, Voorburg (bedroom; decoration and carpets by Vilmos Huszár, furniture by Pieter Klaarhamer)
- 1922 Hôtel Particulier, Paris (building and interiors by Theo van Doesburg, in collaboration with Cornelis van Eesteren)
- 1924 Schröder House, Utrecht (interiors and furnishings by Gerrit Rietveld, in collaboration with Truus Schröder-Schröder)
- 1926-28 Café l'Aubette, Strasbourg (remodelling and interiors by Theo van Doesburg)

Deutscher Werkbund

German design and industries association; established 1907

Founded in Munich in October 1907 by Peter Bruckmann, Peter Behrens, Hermann Muthesius, Josef Maria Olbrich, Fritz Schumacher and Richard Riemerschmid, the Deutscher Werkbund was a professional coalition of designers and industrialists dedicated to the improvement and promotion of German design. Inspired by Muthesius, who had earlier warned of the commercial dangers of backwardness in design, its motivations were as much economic as aesthetic, and, unlike the Arts and Crafts Movement, it did not seek to revive the romantic notion of handicraft but encouraged a closer cooperation between designers and industry. The Werkbund also considered the education of designers and retailers to be vital, and to this end it organised programmes of evening lectures and supporting exhibitions to help raise public awareness about design issues, subsidised a number of industries and founded a Museum of Industrial Design in Hagen.

By 1909 membership, which was by invitation only, had risen to 700 and included the architects Henry van de Velde, Ludwig Mies van der Rohe, Walter Gropius, Marcel Breuer and Friedrich Neumann. By 1914 it had grown to 1,870 and included most of the leading designers, architects, industrialists, craftspeople, teachers and publicists of the time. The Werkbund also produced a yearbook (1912–20), held annual conferences, and in 1914, staged a major exhibition in Cologne. From 1925 to 1934, the Werkbund published a magazine, *Die Form*, and in 1927 it organised an exhibition of housing at Stuttgart, building a model suburb with Mies as its architectural director. However, the Werkbund lacked theoretical coherence. Its belief in the cultural value of quality could be interpreted in many different ways and from the outset the organisation was characterised by fundamental disputes.

Some industrialists quickly recognised the commercial advantages of producing tasteful, modern goods. Emil Rathenau hired Peter Behrens in 1907 to design a new corporate system for the AEG which embraced factories, graphics, products, showroom and office interiors, and workers' estates. The Werkbund Yearbooks included contemporary designs for automobiles, factories, steamship interiors, railway coaches

and illustrated the variety of approaches to interior design. These ranged from Bruno Paul's elegant interior for a Lady's Bedroom for the Westend House, Berlin 1909, to Walter Gropius's Gentleman's Study 1912, where the furniture revealed an interest in clean, geometrical forms, while still retaining a feeling for handcraftsmanship in the highly polished treatment of wood and in the upholstery of the chair.
